Some questions that might arise are:

■ Was a similar chart already available, based on the vendor's definition of business processes and data classes?

■ Was the vendor willing and/or able to produce the chart? If not, why? What are the implications for on-going support?

■ What processes are not supported? Why? What is the impact on the business?

■ What data classes are not supported? What is the impact on the business? What effort is required to support them?

■ What data classes are created by more than one process? Flexibility and complexity issues may arise.

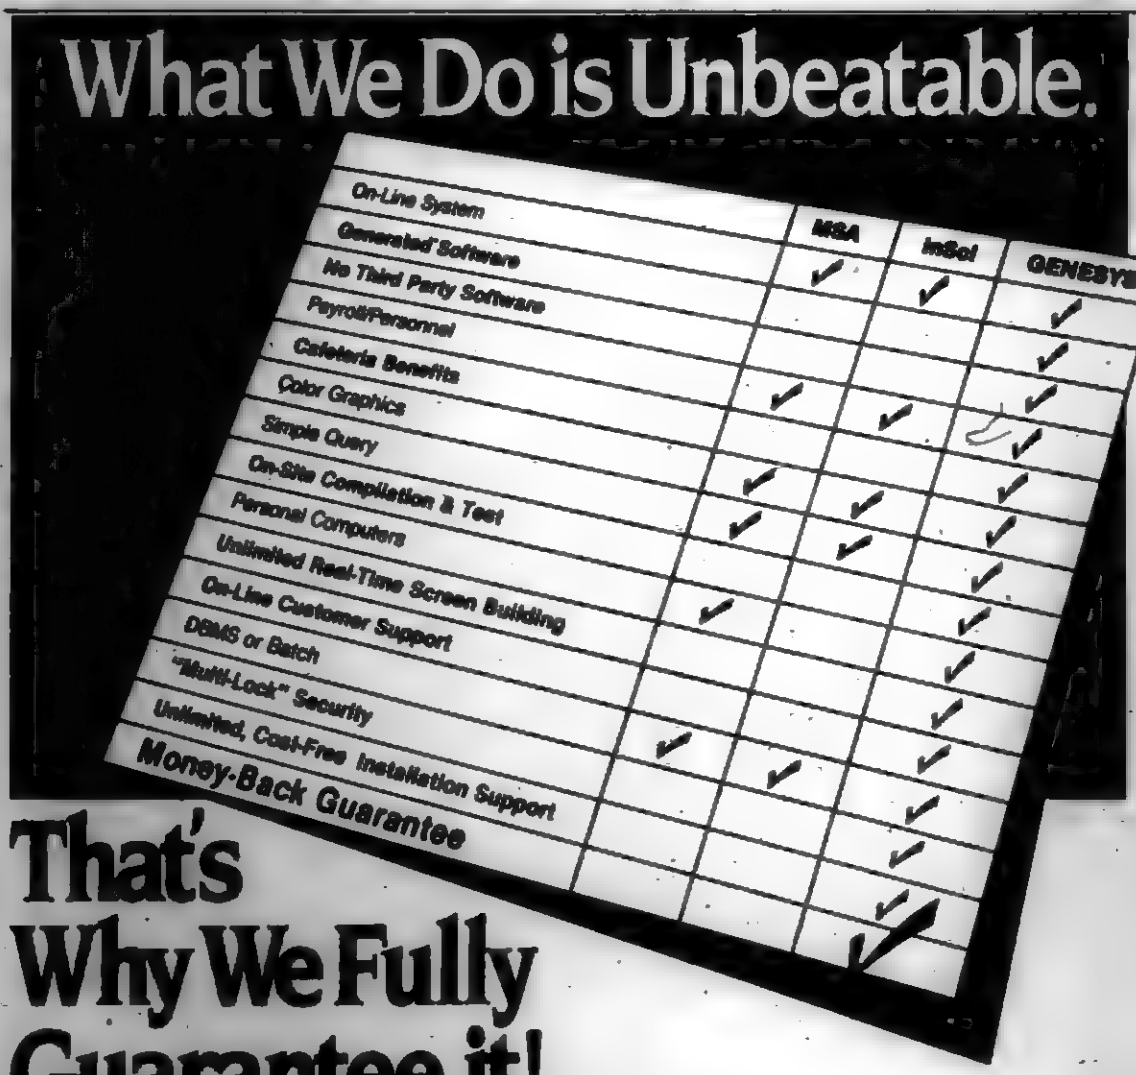
■ What data classes are used, but not created, by the vendor's system? Why? What effort is required for the company to provide the data to the system?

■ Where are the differences in the way the system uses and creates data to support the business? What is the impact?

Software package evaluations rarely conclude that a package matches all of the business requirements.

A decision must be made on the optimum solution, one which can best be identified by comparing the business and the package on equal terms.

Snider is senior systems specialist for Manufacturers Life Insurance Co.



That's Why We Fully Guarantee it!

Only One Human Resource Management System is good enough to be fully guaranteed. Genesys'. Our own people developed all of our software and systems. Our own people will also install our system, compiling and testing all our programs for you. Then our people will stand behind their work with a no-strings, money-back guarantee.

Genesys is simply unbeatable. Most Human Resource Systems contain the raw data you need for management reports, government compliance and to let you know "Is she promotable?". But you have to do a lot of work preparing data to get the information you want because they've added third party software.

Not so with Genesys. All our software is completely integrated and menu-driven. No matter what you need to know about Payroll, Personnel or Cafeteria Benefits, it's easy to get precisely the information in exactly the format you want. Just one keystroke gives you selective search, decision support, PC integration and color graphics. Real-time, from any office, anywhere in the country. With by far the tightest, most flexible security available.

We're so confident you'll be successful with Genesys we'll give an unconditional guarantee. How can you beat that? If you'd like more information on the Genesys HRMS or would like to attend an Executive Seminar near you, call Norman Bushee at (617) 685-5400.

SPECIAL REPORT

System helps resolve DPer, end-user woes

Demands on DPers cut

AUSTIN, Texas — The relationship between DPers and end users is in some ways like a marriage: It can have its strains as each struggles to understand the viewpoint of the other.

But the two groups at the Texas Department of Human Resources here have resolved many of their differences, and they give some of the credit to software from the Chicago-based firm of SPSS, Inc. The department has been using the SPSS Data Analysis System and the interactive SCSS Conversational System since 1978.

"Our end users know more about their systems than we do in the data processing shop," said Diana Williamson, director of the department's time-sharing user support section. "It makes sense to be talking to users about their files and what they want to do in their analysis, rather than just solving technical problems," Williamson added.

The department administers Texas' Aid to Families With Dependent Children program, food stamp program, foster care and adoption programs, Medicaid, health and employment services, disaster and refugee assistance, home energy assistance and other programs.

One out of six Texans

With a total budget in fiscal 1982 of almost $2 billion, the department estimates that each year its programs reach about one out of every six Texans. SPSS and SCSS software are used to organize and summarize data on most of these human services programs.

Williamson said that SPSS users can quickly handle most of their own questions by using the SPSS documentation.

Even though last month her department logged 1,600 SPSS accesses from 57 users, her shop gets called only for SPSS operational or syntax questions.

And the use of SPSS and SCSS has cut down on demands for her DP shop to come up with statistics and reports on an ad hoc basis.

User support section

The time-sharing user support section was formed two years ago, with SPSS as an end-user's tool. Users like Gary Anderson, a research associate in planning, have chosen SPSS and SCSS to analyze demographic and econometric data, surveys and internal department records for planning and forecasting. Anderson has trained about 100 people in SCSS in order to promote end-user "computing self-sufficiency."

"Under the old system, you might wait months for the DP shop to come through with some items of information — where in planning you need a quick response," he said. "By that time, invariably someone wants the information in a different format or with different variables."

"I'm a teacher by nature," said Dr. Michael Penticuff. "I've invested a lot of effort in SPSS personally." As director of data access in the program budget area, he supervises a staff of 17, most of whom use SPSS to analyze data.

"I help them to see the applications SPSS may have in their analysis, working side by side at the terminals.

"We need SPSS reporting facilities to answer an endless barrage of questions from the news media, legislators, people writing studies and administrators in other departments.

"Our analysts and researchers have to manipulate enormous data files constantly; with SPSS they can do that," Penticuff contended.

Department personnel use the packages heavily for statistics. Penticuff uses procedures such as Write Cases, Crosstabs Report and Frequencies.

"I've even used SPSS to fill out forms, which is not a statistical process at all. Reports that had been tak-

> *"Our end users know more about their systems than we do in the data processing shop. It makes sense to be talking to users about their files and what they want to do in their analysis, rather than just solving technical problems. —* Diana Williamson, director of the time-sharing user support section.

ing people several weeks or a month to complete are now a two-hour process. We prepare the data and use the Write Cases procedure to format the output," Penticuff added.

Anderson has become involved in exploring new applications for the SCSS and SPSS systems and promoting their use in state governments. He sees SPSS and SCSS as major decision support tools for bringing quicker, more-efficient analysis to areas of state government that need better ways to look at large aggregations of data.

As for the marriage of convenience between the end-user planners and administrators and the DPers, Anderson said that it is going well.

"We've developed a training system with the support of the time-sharing user support section that seems to work for all of us," he said.

"Your Information, Sir!"

FQS allows end-users to query the computer for every information request, *instantly.*

No more burdening the DP department with programming of ad hoc reports. No more need to learn higher level languages which are still gibberish to an end-user.

FQS is the only CICS or SHADOW-based information retrieval system designed to be on-line from day one. It contains all of the best facilities for sorting, selecting, and printing contained in EASYTRIEVE/on-line, SQL and other batch systems. But FQS is instant, a true on-line query system, menu-driven to allow anyone to get information quickly. Security procedures allow you to control access to valuable corporate information.

Surely, you've outgrown that old batch report writer by now. Isn't it time you moved beyond batch reports and into the simplified world of on-line queries?

Your users will get exactly the information they need because they define it. They will have results in mere seconds. And, your programming staff will be freed to spend their time more effectively.

Call today for complete details on FQS, the Friendly Query System. Go on-line. Go Allegro.

"Test really must experience FQS. Call Allegro today."

How do you choose a personnel system?

Requirements list first priority

By Laura L. Vaughan
Special to CW

Today the broadening scope of human resource management requires decision making that directly affects internal policies, career development programs and organizational spending. Enter the computer and human resource management software. But how do you select a personnel system? Carefully.

The approach is much the same as screening applicants for qualifications. A human resource management system (HRMS) should be hired to do a job.

Selection depends upon understanding a system's strengths, limitations and potential to meet future needs.

An HRMS should never be selected by one individual. Since it will be implemented and utilized by a variety of people at different levels, key people from several areas should be designated as a selection committee so their input can be gathered from the very beginning.

Requirements list

One of your committee's first priorities should be to draw up a requirements list. This list is very similar to a job description. It should itemize both the basic and unique requirements you are looking for in a personnel system.

Keep your list concise and to the point, and identify the "must have," "desirable" and "wish-type" requirements separately.

This list can be developed into a questionnaire to be mailed to prospective vendors. Include a brief statement of your objective, and be sure to provide space so that the vendor can discuss product philosophy, service approach, maintenance policies and future enhancements to the product.

Package deal

It is important to remember that the personnel system and the vendor are a package deal. You are establishing a long-term business relationship. Exercise the same care you would in evaluating a candidate for upper management.

Pay particular attention to the following areas:

■ Fit. Does the system fulfill the majority of your requirements for processing and reporting? Define what is missing from each vendor package and narrow the selection down to those systems that meet most of your needs.

■ Flexibility. Will the system accommodate future changes and growth within your company? Does the system allow you to define what information is to be processed? Can you produce the reports you need? Can new companies, divisions or departments be added easily? Does it interface with a payroll system? Is it on-line? Are the contents readily available for immediate inquiry and/or modification? Can the information be displayed graphically?

■ Training. Is training provided for the data processing staff? The terminal operators? Personnel management? Consider what kind and how much training is available and where it is to take place.

■ Documentation. What type is provided? Is it clear, concise and readable? Remember, good documentation will assist in training new personnel employees.

■ Security. Can you add, delete or restrict terminal operators from specific areas in the system? Can operators be added or deleted easily? Is there an audit trail to track what changes were made and when?

■ Installation. Can the vendor meet your desired dates? Who will perform the installation? Can the vendor assist with any transfer of information from an existing system?

■ Support. This critical area is often forgotten in the evaluation process. Ask what the standard procedure for support is, and don't forget to ask about the availability of phone-in support.

■ Maintenance. Again, you are establishing a long-term commitment. What happens after the sale? Ask about a software maintenance agreement and review a copy of it.

■ Cost. Many factors affect the systems cost, and cost is not always indicative of quality. Does the cost include documentation? Installation? Training? What is the warranty?

■ References. Contact several of the vendor's current customers to discuss their opinions of the vendor as well as its HRMS. If possible, talk to those references who are of a similar size in a similar type of business.

After reviewing the vendor information, you should have narrowed your selection to two or three vendors. If at all possible, visit the vendors' sites.

The importance of on-site visitation cannot be overemphasized. It gives you a chance to see the software in operation and to evaluate its ease of use. It also affords you the opportunity to get to know the firm's key people.

More than likely, you'll glean a feeling for the firm's personality and a better perspective of its operating philosophy. Very often, the on-site visitation will make the final decision an easy one.

Vaughan is financial systems sales manager at Collier-Jackson, Inc.

SPECIAL REPORT

Systems methodology wraps up the package

By John B. Toellner
Special to CW

Applications software packages can provide quick solutions for underbudgeted DP installations jammed with backlogs, but without adequate planning and control, the quick fix can become a slow drain on time and money.

How responsibilities and duties are performed directly affects the value and efficiency of any system. Unless procedural mechanisms exist to ensure that appropriate steps are taken at each point in a project, data resources can become uncontrolled and fragmented. Systems methodologies offer the planning, control and overall management that are essential in a productive information service department.

Both new technology and methodology are important. What is needed is a marriage of the immediate advantages of packaged software with the long-term benefits of good project planning. Because of the increasing use of applications packages, many systems development and management consulting firms are creating standards and procedures for the evaluation, modification and installation of packaged software.

A project may start because enhancements are needed on a package. Sometimes the package selection isn't made until the system and program design specifications are in place, usually because the software satisfies only a small portion of the system requirements.

In any case, a good methodology takes each situation into consideration. The evaluation process should encompass functional analysis to ensure that user requirements are being met, a definition phase to confirm that the software matches the specifications and a performance test to determine if the package performs appropriately.

If a few user requirements are not met, or some features and functions in the package exceed specifications, the modification process must be initiated. After all modification demands are identified, planning and estimating procedures should be undertaken. Massive modification to packaged software should be considered carefully. Experience has shown that such changes often create downstream complications and should, in most cases, be discouraged.

At a recent user conference sponsored by Spectrum International, Inc., a data processing systems development and management consulting firm, Abbott Laboratories reported on its experiences with modifying packages. The company's advice was not to modify, but instead, to create interface programs to resolve mismatches with user requirements.

The execution of interface and modification work is determined by the architecture of each methodology. At Spectrum, for example, analysts identified the work in the form of life-cycle tasks, walk-throughs and documentation requirements that were then given to the vendor. Life-cycle tasks included the preliminary design, detail and program designs and programming activities, as well as supplementary tasks unique to the process of installing purchased software packages.

Maintenance agreement

Another important installation activity is the determination of a maintenance agreement. Here there are no clear guidelines because the decision depends on the experience level of both the client and vendor staffs. Some software packages are best supported on a continuing basis by the vendor, but others can be handled through a transition process that gives maintenance responsibilities to the client in phases. In some cases, the best arrangement is for the purchaser to take responsibility immediately after initial implementation.

A systems methodology provides the guidance for easier maintenance and greater flexibility of packaged software. When using applications from multiple vendors, for example, it is difficult to have consistency from document to document and from project to project. With a methodology, where the architecture is designed to control the sequence and format of all project deliverables, consistency is ensured during installation.

A good methodology provides overall project management through planning and estimating functions. The information services department is forced to capture user requirements before large sums of money and a great deal of time are spent, whether it is for systems development, purchasing and installing software packages or project maintenance.

The key element in the methodology is to have the package software process merged into a single life cycle that will also serve other software projects.

Toellner is president and chairman of the board of Spectrum International.

Our online, interactive, integrated applications software can open new doors for you.

Computer Associates combined its superiority in systems design with solid business input to let you increase your company's efficiency—and improve your Data Center's productivity as well.

Our Advanced Business Software Series is a family of online, integrated—and interactive—components.

Each provides powerful, specific solutions to financial, distribution or administrative problems. Together, they form comprehensive, computer-efficient systems for every company operation—without impeding the Data Center.

Simple menus permit easy end user access to information—without programmer's help—and data is displayed in simple business language.

Conversion is fast and efficient. And because CA's complete line of products is integrated, your new efficiency will continue as your needs grow.

CA's applications family now includes General Ledger... Accounts Receivable... Accounts Payable... Financial Planner... Order Processing... Inventory Control... Asset Management... Job Cost... Purchasing... Personnel Management.

Our responsive service is already keeping over 13,000 Computer Associates customers satisfied. Bring new efficiency to your whole company. Contact your local CA business account manager for specifics on any or all of our products. Or call 800-645-3003. In NY: (516) 333-6700.

MRP software study
Methods for evaluation

By Robert Clifford
and Anita Lang
Special to CW

The remarkable proliferation of manufacturing resource planning (MRP) software recently has made it difficult to compare competing products and to select a product that demonstrates the best fit with the way a manufacturer does business.

Over the course of the last year, Keane, Inc., a DP consulting firm in Lexington, Mass., conducted a study of companies purchasing such products. An in-depth interview was conducted with key personnel involved in the selection process from over 50 firms that had recently purchased and implemented MRP software. Additionally, data was collected on a more informal basis by Keane's marketing and sales staff, which contacted over 2,000 individuals by telephone and met with representatives from 150 companies actively looking to purchase MRP software.

Keane found that companies can be roughly divided into three groups in their approach to the MRP search. The large manufacturing firms with over $30 million in revenues, not surprisingly, had the most structured and disciplined methodology. Over 70% of these firms used a committee approach, generally involving six to eight players. Typically, these committees included the manufacturing manager, the controller, the MIS director, a data processing staff member and the operations and production managers. One-third of the firms also engaged the services of a consultant.

In short, these firms included key personnel in the selection process, not only to evaluate the software packages, but to establish the packages' acceptance criteria. These companies generally formulated a structured methodology that closely follows the six principles of productivity management (see chart above).

The middle tier of companies ($10 million to $30 million in revenues) tended to operate in a significantly less structured way. This group tended to have its short- and immediate-term needs very well defined, and senior management was intimately involved with the selection process. This group was less certain about projected needs for the future.

The decisions were generally made a lot quicker. While some companies used the committee approach, many went about selection in a more ad hoc way.

The small manufacturers were the least structured and organized in the selection process. These firms, for the most part, perceived their manufacturing environment to be in need of more stringent controls. There was also a perceived need to computerize, although the company's problems were often not well defined at this point.

A number of factors distinguish the more successful game players:

- While a committee approach often is helpful, the structure can often get in the way of making a sound business decision in a timely way.
- A number of committees attempted to reduce the management decision to a computerized model or to feature a checklist. While such tools can be effective in terms of organizing the evaluation process, they should not substitute for a sound management decision. Likewise, while private consultants can be enormously helpful in educating companies about such products, they should never make the final determining decision.
- The companies that appointed strong leaders supported by senior management to manage the selection process were often the most successful. These leaders delegated tasks to individuals on the committee or within the company, establishing both time frames and budgets.

Other important points to address in the selection process include:

- Making sure that your company can grow with the package you ultimately plan to purchase. Ensure upward compatibility in terms of the hardware.
- Determining that the product has been successfully installed elsewhere. Talk to other users.
- Ensuring that the company you plan to do business with will be around next year to support you.
- Asking if the vendor has the ability to customize and modify the package. If not, this work may ultimately be very costly. Determine at the outset how much support and training the vendor will provide as a part of the purchase price.
- Researching any number of documents that attempt to define what should be included in a standard manufacturing system. They can be enormously useful. These de facto standards say that a firm should look for a package that is on-line and real-time, is written in a popular language for ease of maintenance, is designed to allow for simplified modifications and is well documented.
- Getting in writing the vendor's promise that an enhancement or feature that is critical to your operation "will be available Jan. 1."

Clifford is the general manager for Keane's manufacturing products group. Lang is a marketing analyst for Keane's information services division.

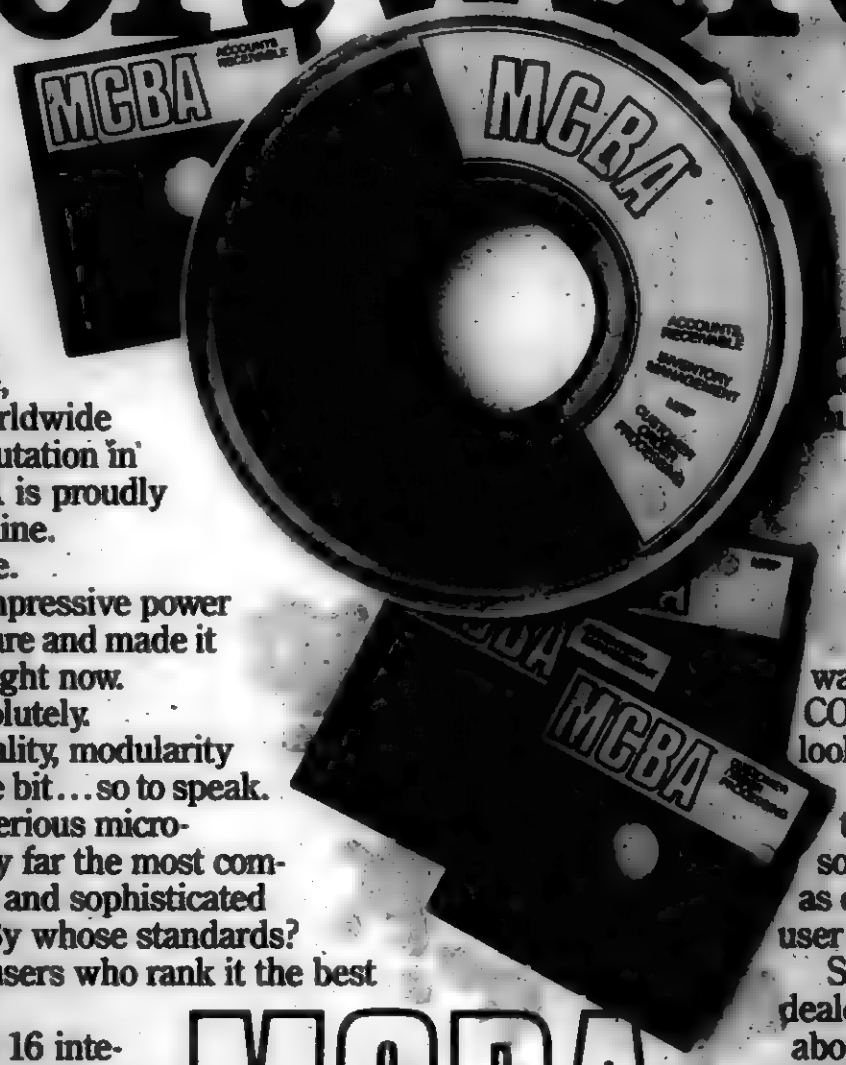
MCBA introduces shrink-to-fit software.



With nine years in minicomputer software, 15,000 installations worldwide and an established reputation in the mini world, MCBA is proudly shrinking its software line.

Down to micro size.

We've taken the impressive power of minicomputer software and made it available for micros. Right now.

Alter the fit? Absolutely.

Alter the functionality, modularity and capability? Not one bit…so to speak.

This new line of serious microcomputer software is by far the most comprehensive, well-tested and sophisticated in the industry today. By whose standards? Thousands of MCBA users who rank it the best in the business.

MCBA's library of 16 integrated manufacturing, distribution and accounting packages can be installed in whatever combination

nd sequence a user eeds for his or her usiness.

It grows with businesses. No matter what size they are now. Or want to be later.

And MCBA software now runs in RM/COS,® UNIX™ and UNIX look-alike environments.

In other words, we've tailor-made our newest software to fit micros—as comfortably as it fits user needs.

So whether you're a dealer or a user, find out about it. Call us now at (818) 957-2900.

Shrink-to-fit software. For growing businesses.

Tips for automating the general ledger

By Susan B. Kreuzer
Special to CW

The general ledger is the core of any accounting system and, as such, is one of the most valuable tools for management's day-to-day control and monitoring of the company's results and goals. It provides information through which management can measure performance against objectives, redefine the company's principal goals, monitor its cash position and identify changes in productivity and profitability.

Once the decision has been made to automate the general ledger and purchase a packaged product, there are a few important steps that should be followed.

Establish a project team. From the outset, a project team should be organized consisting of both accounting and DP personnel. Although a representative from the accounting department will ensure the quality of the solution provided by the software product, the data processing manager will maintain the ultimate responsibility for the entire system's efficiency.

It is the project team's responsibility to educate the corporation, including corporate management, accounting staff and data processing personnel. Corporate management should have realistic expectations regarding the time involved. Managers should be fully aware that it will be six months from the time the decision

LEDGER from 82/48

to automate is made to the time they will see any results.

The data processing department should be educated to the basic operating procedures of the accounting cycle.

The accounting department staff members should be educated to the benefits of the automated general ledger. They must be assured that their jobs are secure. Automating their function means many things for them in addition to the acquisition of new job skills.

Identify the system's requirements. It is essential for the accounting department and the data processing department to agree on the total benefits of the product. Compromise is often the order of the day. Typical questions asked by the accounting department are: Does the package accommodate most existing company procedures, codes and account structures? Does it eliminate redundancies and repetitive tasks? Does it provide regular reports in formats most useful to the company? Is it an on-line, interactive, real-time system?

While the on-line capabilities of a general ledger are popular with the accounting staff, DP managers are more concerned with the internal workings of the applications. They ask questions like: Do the packages generate a lot of I/O? How many CPU resources will be needed? Are there recommended cycles for the jobs? How much disk space will I need to allocate? How many DP personnel are required for installation and maintenance?

Delegate departmental tasks. The accounting department should put the manual general ledger in order, and the DP department should search for and evaluate software packages.

The data processing department should search for the ideal general ledger package for the corporation. The requirements are based upon the previously defined needs of both departments.

The departments should work simultaneously for the next two months on their separate projects.

Install and test the package. It should take only a few days to install the software package. This is primarily the responsibility of the software vendor. However, a representative from the DP department will want to know the way the system is installed, where it is located and what other packages can interface with it.

Implementation and testing of the product will take the DP department approximately 2 months. A representative of the accounting department should be available during this time for consultation and evaluation, since some modifications to the package may be necessary. This is where a user-defined system is advantageous. It provides parameters and file structures that do not restrict the user.

Run parallel general ledgers. To ensure the security and integrity of the corporate data, both the new system and the manual and computerized general ledger should run parallel for at least two months.

Compelling benefits

In addition to the basic savings of the manual clerical activities of posting transactions and producing reports, automation of the general ledger to an on-line system has other compelling benefits:

- A single input of the transaction means automatic posting, first to the relevant subsystem, then to the general ledger and any subsidiary balance sheets and operating accounts.
- Real-time processing means that data is always current to the last transaction.
- The accounting department has more control of its data and its schedule of output.
- The DP department is relieved of many of the programming and maintenance tasks required by batch systems.
- Reports are available sooner and without taxing the DP programming resources.
- The accuracy and security of the information recorded in the general ledger is improved.

Package helps GTSI team grab Nasa contract

BETHPAGE, N.Y. — When the management contract renewal date for the National Aeronautics and Space Administration's (Nasa) space shuttle program came up last August, Grumman Technical Services, Inc. (GTSI), a division of Grumman Aerospace Corp., teamed up with Lockheed Corp., Morton Thiokol, Inc., Pan American World Services, Inc. and the help of a financial software system to challenge Rockwell International Corp. and its partners for the contract.

GTSI needed to put a management team into action quickly at the Kennedy Space Center in Cape Canaveral, Fla. Automated accounting, job cost and payroll procedures had to be set up within 90 days to handle the 1,000 employees that GTSI would need.

At the same time, the system had to meet the strict reporting and security procedures required by Nasa, according to Stu Cornell, GTSI's manager of data processing.

"We had a tough decision to make. There was no time to develop an entire accounting package for the shuttle program from scratch," Cornell said. Grumman Aerospace has an accounting system running on an IBM mainframe that was designed for over 25,000 employees. "We decided it would be too costly and time-consuming to modify that system for our needs," Cornell said.

Further complication

The situation was further complicated by the uncertainty of the management contract award. "We did not want to buy a computer and get stuck with hardware we don't need," Cornell said. "Leasing the hardware and buying the software was not a suitable option either."

Grumman decided to lease both the hardware and a packaged software system. A month-to-month lease, with an option to buy if the contract was awarded, carried the least risk, but there were very few firms willing to lease a computer system and proven software on a month-to-month basis, he said.

Off-the-shelf applications software from On-Line Accounting Systems, Inc. of Houston was recommended by George Smith, manager of data processing at Grumman St. Augustine, a subsidiary of Grumman Aerospace in Florida. Smith recommended the Fully Automated Management Information Solutions (Famis) accounting package from On-Line Accounting.

"Three years ago, Grumman St. Augustine began operations with 12 employees and projections for rapid growth," Smith said. "We needed to automate our accounting. We had to consider the trade-off between the number of hours it would take to develop a system in-house vs. purchasing prepackaged software."

Grumman St. Augustine needed a personnel file that could handle a wide range of deductions and variations in pay scales for union and non-union workers, provide instant access to current data and allow for budgeting.

"Most important, we needed a proven accounting package that would be backed by experienced personnel," Smith said. Since acquiring Famis, Grumman St. Augustine has grown to over 450 employees, Smith said. The system now handles over 28,000 general ledger records, with about 1,000 accounts payable checks written every month, labor distribution hours collected from time cards on a daily basis and 450 paychecks written every week.

GTSI contracted with On-Line Accounting to modify the software and lease it and the necessary hardware from Datapoint Corp. with an option to buy if Grumman won the contract.

Major modifications included expanding the job-charging fields to accommodate Nasa's requirements for job costing, rewriting the time-card input and reworking the interface between master files and the general ledger, Cornell said. The system was installed by the end of July 1983, and all modifications were handled by On-Line Accounting staff.

The Lockheed/Grumman/Thiokol/Pan Am team was awarded the management contract for the space shuttle program on Sept. 7, 1983. "We had less than 30 days to be fully operational," Cornell said.

"Despite last minute changes in government regulations and procedures, the Famis accounting package was fully operational by the official start-up date of Oct. 1," he added. A duplicate system was installed at the same time at the GTSI operation at Vandenburg Air Force Base, Calif., where future shuttle flights will occur.

Famis handles approximately 1,000 Grumman employees in Florida and California. It has the capability to handle all types of pay scales, pay policies, deductions and taxes, Cornell said.

"Security is essentially foolproof," he noted. "Each data entry person is assigned several levels of security and can only access data within those security levels."

consco

Fast, accurate, fully automated consolidations from consco

We're the only people who do consolidations the right way. In fact, that's been our specialty for more than a decade.

Since our System is dedicated to consolidations, you can expect a lot more from it. Your accountants will be freed from the tedious tasks to do the more important things. And your management will get powerful, useful reports that just weren't possible before.

Our system provides:

- automatic reconciliation and elimination of intercompany balances.
- multiple hierarchies (geographic, legal, etc.) including lower level consolidations (by groups, divisions, and so on).
- changes to hierarchies without reprogramming or restating past data.
- automatic creation of journal entries (tax, minority interest, etc.).
- no limit on the number of periods or kinds of data, including budgets, plans, and forecasts.
- currency conversion and planning using average, current, and historic rates in conformance with FASB 8 or 52.
- fast reports that allow multiple formats on a single page, ranking of any data, and preparation of analyses and operating statistics and schedules required by management, the SEC, and the IRS.

The Consolidation System has interfaced with practically all the major General Ledger packages, as well as our customers' in-house systems. Of course, it also interfaces pretty neatly with our own Accounting Information System.

Information processing beyond the General Ledger

The CONSCO Accounting Information System (AIS), using relational architecture, brings all your data together so you can get the reports and analyses you need to run your business. CONSCO specializes in the tough jobs. Even if your requirements are so complex you thought you had to have custom software, AIS can handle your needs at packaged software prices.

Features of the Accounting Information System include the following:

- all normal General Ledger and Subsidiary Ledger functions: accruals and reversals, standard entries, comprehensive allocation capability, detail analysis, and financial statements.
- absolutely no restriction on number of fields or field sizes.
- processing abilities are not limited to General Ledger data. Any number of subsystem and descriptive fields may be used for complete information processing.
- edit tables which incorporate full Boolean Logic. These tables may be changed at any time and may access any data field, hierarchical or otherwise.
- an unlimited number of budgets, revisions, projections, and statistics without the need for special account codes.
- unlimited time period history with the most efficient data storage organization.
- an extremely powerful Report Writer lets you use any data, even subledger and operations data, to create the reports your people need.
- full on-line capabilities for data entry, update, and inquiry.

CONSCO's commitment to you does not end with our software. We offer on-site training and support, and a CONSCO Users' Group.

Our customers include many of America's largest firms. So if you're looking for mainframe software that does your tough jobs and more, call or write us for more information.

SPECIAL REPORT

CBT maximizes railroad's end-user training

And keeps pace with emergence of info center

ST. PAUL, Minn. — "Two years ago, when I proposed to management that we look into adopting computer-based training [CBT], I had never met anyone who had learned a significant chunk of his job through a computer," said Pat Joyce, manager of training in the Information Resource Department of Burlington Northern Railroad here. "But it seemed a good way to attack computer phobia, and perhaps even computer illiteracy, at Burlington Northern."

Joyce's interest in CBT came about after he and his three-person staff had devoted eight years to training DP personnel. Multimedia training joined in-house and vendor-sponsored seminars as the training vehicles most often used. But as the company's information center began to emerge and involvement in end-user training began to expand, Joyce saw an additional reason to implement CBT.

'Joyce's interest in CBT came about after he and his three-person staff had devoted eight years to training DP personnel. . . . As the company's information center began to emerge and involvement in end-user training began to expand, Joyce saw an additional reason to implement CBT.'

"The information center was one of the end-user groups we initially surveyed regarding a CBT program," he explained. "I had been told that CBT is particularly cost-effective when many people need short-term training, so CBT seemed the ideal solution."

Joyce received the go-ahead to hire Kathy McGovern, a professional whose background in educational design included extensive work in CBT. She headed a four-person formal committee to begin reviewing CBT system software in order to bring its capabilities in-house. McGovern, Joyce, Kurt Haubrich, who was a third training professional, and Rick Perry, a systems programmer acting as the group's technical advisor, were the search group members.

"We already knew that we wanted to look at IBM's Interactive Instructional System and Phoenix from Goal Systems International, Inc. In addition, Scholar Teach III from Boeing Computer Services Co. was also under review," Joyce said.

"Our first step was to request a formal presentation from each vendor and put together an extensive request for written information on each product."

The Burlington Northern questionnaire asked about hardware requirements, installation procedures, CPU impact in multiprogramming environments and testing features. Vendors were asked if they had two authoring systems, one for programmers and one for nonprogrammers; how many current users were involved with the products; and whether customers included other railroad companies. Student registration, vendor-provided training, documentation, product trials, upcoming product development and system costs were other issues addressed by the document.

"We asked for a free, 60-day trial of the product," Joyce said. "Our plan was to put each of the three systems through as many hoops as possible, learning the product and then using it to develop a simple course."

The committee found Phoenix had superior editing capabilities, allowing the search group to create and run courses on-line without requiring batch runs, compilations or verifications, Joyce said. A perpetual Phoenix license was purchased in early 1983.

"Our first CBT project was to create a course to teach the marketing

SPECIAL REPORT

A view of the claims processing spectrum

Back-end, recording and adjudicating systems

By James H. Bowman
Special to CW

Processing of claims for health care employee benefits is an ideal on-line application for companies that self-administer their group health insurance programs and for administrators of multiple-employer trusts, insurance companies and other third-party administrators.

The job of choosing and installing one, however, is complicated by the spectrum of so-called automated on-line claims processing systems that are available.

Not all on-line claims processing systems are equivalent. They can be characterized as either back-end, recording or adjudicating systems (see Figure 1).

Back-end system

A back-end system is one in which results of manually settled claims are keyed to the system, and the system performs remaining clerical functions (in batch mode), producing such things as checks, statements of remittance, explanations of benefits for employees, check registers and other summary reporting.

Generally speaking, such systems handle clerical output chores, but do not contribute in any significant way to actual claims processing functions.

Recording systems are those that provide all clerical functions of back-end systems and also act during claims processing to provide automated recordkeeping and retrieval functions.

Such systems use the computer to eliminate essentially all of the paper that is created during manual claims processing.

Usually, manual work sheets are replaced with one or more on-line terminal displays, and a computerized claims history exists to replace family file folders.

Recording systems

Recording systems provide both clerical functions of back-end systems and file-handling functions. Such systems are still better described, however, as computer-assisted rather than computerized.

The final system category is the automated adjudicating system. It is designed to accept claims information at the same raw level of detail as exists on the claim and the accompanying health care providers' itemized bills and to actually do the adjudication of the claim.

Such systems provide clerical functions of back-end systems, file-handling functions of recording systems and actual claims adjudication functions.

Adjudicating systems afford maximum potential effectiveness in the man-to-machine ratio. They are also the most sophisticated and difficult to design and develop. They typically have the highest nonrecurring costs to select, acquire, install and start up.

They also have higher recurring operations and maintenance costs. However, the labor savings of automated adjudicating claims systems can be expected to more than offset their higher systems costs for sufficiently large-volume claims processing operations and correctly matched claims processing software packages.

Most systems now available are a cross between automated adjudicating and automated recording systems. Most are only partially capable of accepting itemized-bill-level data that is required to drive a truly automated adjudicating system.

Into conversion

Claims processors, with the notable exception of dental claims processors, typically convert itemized procedure-level information to a type of service or benefit level that is understood by the system.

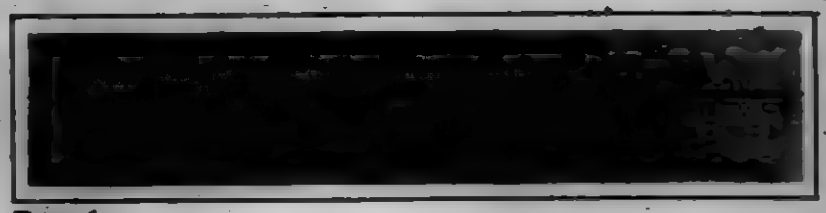

Figure 1

In so doing, the owner of the system is paying for this internal, manual claim-by-claim coding function. Typically, the coding function itself has already preadjudicated the claim because information goes into the system at the benefit level rather than the itemized bill level. The com-

Large systems hardware is not an impulse buy.

Now there's a guide coming to you that will help with your homework.

The *Computerworld Buyer's Guide to Large System Hardware* is designed to give you a valuable, one-stop information source for large systems hardware and peripherals. Take a look at all the tools it will give you to help you make the right large systems choice:

- Large systems product listings, including mainframes, superminis, minis and small-business systems and the terminals and peripherals designed to work with them. You'll get listings of printers, memory products, teleprinters, controllers, magnetic media and supplies, plotters, digitizers and much, much more.
- Vendor profiles that include company name, address, contact information, and primary markets served.
- An industry-specific editorial section that's designed to keep you right up to speed on the trends in large systems hardware. We'll give you news of the latest developments in mainframes, superminis and minis and their changing roles. You'll get information on the latest management techniques used in running data centers; planning for cost effectiveness and the new technologies in fifth generation computing.
- In addition to its comprehensive listings and editorial, the *Computerworld Buyer's Guide* will give you pages of detailed ads for large systems hardware products and peripherals that you can refer to all year long.

Each issue of the *Buyer's Guide* is updated before publication, and contains hundreds of listings that are accurate, complete and easy to use. This *Buyer's Guide to Large System Hardware* is distributed to *Computerworld's* 114,000 subscribers in the U.S. — it's one more of the additional benefits you get as part of your *Computerworld* subscription. Look for it this April 18th.

And if you market your products to buyers of large systems hardware and peripherals, this *Buyer's Guide* will reach them with your product message just when they're researching products and vendors. Reserve space in this *Buyer's Guide* by March 2nd by calling one of the sales offices listed below, or call Ed Marecki, National Sales Director or Kevin McPherson, Product Manager, at (617) 879-0700.

CLAIMS from SR/53

puter is merely reacting to declarations of benefits by claims processors rather than on itemized-bill-level data of original claims submissions.

In evaluating claims processing systems, it is essential to understand the difference between user-friendly (friendly to users) and non-user-friendly (friendly to nonusers) systems. Most systems marketed under the banner of user-friendly are more apt to be non-user-friendly and are somewhat user-unfriendly.

To the nonuser (typically the high-level buyer, who has probably never processed a claim), on-line systems, which are highly conversational and uncluttered by sparse data displays and small data entry increments, look very user-friendly. In reality, such systems that demonstrate extremely well for these basic nonuser purchasers do not work all that well for the personnel in the trenches.

'Changing claims administration systems is something that should be done no more than once every five to 10 years, and it is worth spending up-front money — even prior to beginning a procurement process — in order to improve chances of obtaining the best available system for both current and projected claims administration needs.'

Actual users of high-volume, production-oriented, repetitive task systems want systems that are simple, lean and fast. In short, users who know what they are doing do not want to be burdened with a system that is too slow because of non-user-friendly features.

It is essential that organizations have customized shopping lists prior to looking at systems. Unless internal professionals are available who have expertise in both claims administration and automated, high-volume transaction processing systems, external consulting assistance should be sought.

Changing claims administration systems is something that should be done no more than once every five to 10 years, and it is worth spending up-front money — even prior to beginning a procurement process — in order to improve chances of obtaining the best available system for both current and projected claims administration needs.

Deverman is founder and president of Medical Data Systems, an Albuquerque, N.M.-based consulting service organization specializing in automated claims processing and related information systems.

Cut Information Retrieval Down To Size

...with BRS/SEARCH— the Software That Comes In Mainframe, Micro and Mini Sizes.

BRS/SEARCH, the same information retrieval software that runs one of the world's largest online database systems is now available for your mainframe, mini, or micro computer.

BRS/SEARCH gives you instant access to all your own information, regardless of its length or format. Many powerful, easy-to-use features developed through millions of online searches have made BRS/SEARCH the system of choice among information professionals.

BRS/SEARCH runs on IBM and compatible mainframes, as well as 16 and 32 bit mini and micro computers. And because the search query language is the same no matter what size computer, you can use it on a variety of systems without any additional training.

For more information about these three new sizes of database software, call (800) 235-1209. Or write BRS Software Sales Support, 1200 Rte. 7, Latham, N.Y. 12110.

Dealer and OEM inquiries invited.

CBT from SR/52

department to use a new computerized transportation system," Joyce explained. "This corporate system allows our marketing specialists to estimate the costs independent truckers would incur for various contracts on which Burlington Northern is bidding. By knowing the approximate costs our competition faces, we can be more accurate in our own cost estimates and business forecasts."

Using Phoenix for the first time, McGovern completed the course in approximately three months, including a detailed course evaluation by nine people and error corrections using the Phoenix on-line editors. The course is designed in three parts, each offering about an hour of instruction.

Part one provides general information about how to take a CBT course. Part two presents three detailed case histories, which teach students how to deal with the variables used in cost estimating. Part three continues these problem-solving case histories and also teaches the student how to use reference materials. To date, 20 marketing and rate-setting professionals in the company have completed the course.

As Burlington Northern worked to author its own CBT course, the company also began looking at off-the-shelf vendor courses. An introductory multimedia course on the information center was selected from Deltak, Inc. as the first training a new information center end user receives.

Fifteen to 20 people view this course during a two-hour seminar and group discussion which is held almost weekly. Then, each end user is invited to the training center to learn DP skills. About 500 people have completed this introductory training.

"Six months ago we brought in a CBT course to teach report writing under [Information Builders, Inc.'s] Focus, and today 70 people have learned Focus from that course," Joyce said.

Every Burlington Northern user department has used CBT. "Two years ago, I was not involved in any end-user training at all; today I would say I divide my time evenly between standard application development staff training and end-user training through the information center," Joyce said. "I know the evolution is toward more and more end-user training, which means a larger share of my time will be devoted to CBT."

...before your users do.

Candle knows that when a business depends upon its IMS online system, that business is also vulnerable to the problems within that system. We developed RTA/IMS to help reduce user and customer frustrations because of poor response time. With RTA/IMS you won't be caught off guard by user complaints about poor response time. As a matter of fact, you can be warned when response times approach their thresholds, BEFORE your users perceive a serious problem.

For a graphic view of your response time, RTA/IMS features Moving Time Slot Analysis. RTA/IMS' "Fixed Window" will continuously monitor the 10-minute response history for the transactions selected, whether or not the "Response Threshold" has been crossed. For dynamic warning of problem transactions, RTA/IMS' "Dynamic Window" will display the 10-minute response graph only if the response time for the selected transaction has exceeded your acceptable response time level.

To recognize impending problems by spotting short-term trends, Time Interval Analysis presents response times for three distinct intervals such as 5, 15 or 30 minutes. To determine what your response time was for transactions at certain periods of the day (ex. 9:00-9:30, 9:30-10:00, 1:00-2:00, etc.), RTA/IMS' Selected Time Slot Analysis will display the response time for your specified transaction—that simple and that easy.

RTA/IMS' Moving Time Slot Analysis displays "Fixed Window" (right side of screen) and "Dynamic Window" (left side of screen).

RTA/IMS provides real-time feedback on IMS response time so that you observe short-term trends, receive dynamic warning of performance problems, and thus improve IMS service levels to your end users.

SPECIAL **REPORT**

Programmer's tool kit eases maintenance ills

By Russell P. Sarney
Special to CW

Are you maintaining an older application system and unable to find that program a co-worker wrote to patch up the pointer file? Does it take a long time to build that new subsystem — the one the user asked for eight months ago?

The following programmer's tool kit was developed to support a seven-year-old credit union package running on a dozen minicomputer user sites. It may help ease your application maintenance difficulties. The kit consists of the following:

A sorted directory table of contents.

This program searches a disk directory for all source, Job Control Language and text file names. It then sorts these names into alphabetical order. The program then opens each source or text file and prints the first line or identification title line. This listing is now a usable directory or table of contents of all programs on the disk. This is quite handy when you are troubleshooting and looking for a program.

A sorted program listing.

Using the same directory file, list all the programs in sorted order. Put them in binders and label them clearly. Often, interactive minicomputer programmers have a tendency to use their terminals to troubleshoot. Because this approach allows you only to "view" 24 lines of code at a time, you may miss the big picture or other potential trouble areas.

A customer service report (CSR).

The CSR form was designed to capture a description of problems and solutions or actions taken. This helps to identify problems with particular programs or user sites. You can identify steps that were taken the last time the problem occurred.

A key-word search program.

This program allows you to use up to 10 key words or parts of words to search a text file. The types of files for which this is effective would be one-line CSR summaries or the sorted table of contents. By automating the search method, you can reduce the time needed to locate a program or CSR summary.

A pretty print.

This is a structuring engine to rebuild selective programs. One developer actually built a program to align and indent source text built by over a dozen different programmers over the last seven years, each with his own style of coding. This program helped provide a more uniform look to the programs.

A survey guide.

A questionnaire can be developed to make sure that installation at each site will have a minimum number of surprises. This helps to capture some of the "blue sky" the salesman sold. If you have half-a-dozen programmer/analysts analyse the users' requirements, you will get half-a-dozen different requirement definitions. By having your "super" analyst write down all the questions that he would ask, you've got a better chance that all the other analysts using this survey guide will also ask these questions.

A program generator.

In several hundred programs, many functions are common to each. You can generalize each of these functions and put them in a copy library.

Clean up the record format library and generalize the file access schemes. Create an indexed "files definition" data dictionary that contains the characteristics of each file. The generator allows you to "paint" a screen before you commit it to code, and the same holds true for the report generation functions.

Most systems have some type of copy library function, a screen builder and a report generator. The difference here is that the generator binds all of these "independent" functions into a single interactive work session.

This tool kit has been evolving over the last four years. In order to have a chance at keeping up with the demand for computer usage, don't become static in the development of new tools.

Sarney is a DP consultant in Honolulu.

Packaged tool allows for growth

NEWTON, Mass. — The Shipley Company, Inc. is a leader in sophisticated surface chemistries, providing products and systems for printed circuits, microelectronics, plating on plastics and metal finishing applications.

As demands for Shipley's highly technological solutions to chemical problems increased, the company turned to computer systems for day-to-day business operations. Several years ago, the company installed an IBM System/3, which later was replaced by a Honeywell, Inc. Level 62 minicomputer that relied chiefly on "home-grown" software for the accounting functions.

It soon became evident that the software developed in house was too complicated to maintain. It also did not provide the flexibility needed by the accounting department to keep pace with the company's continuing success and expansion. Following a search for a packaged software solution, Software International Corp.'s General Ledger and Financial Reporting System was selected.

"Shortly before I joined the company, I had been involved in a comprehensive evaluation of the leading financial application packages, including Software International products," said Joseph A. Merchant, Shipley DP manager.

"Since Software International had a system for Honeywell Level 62 equipment, there was no need to go through a complete evaluation again, and we installed the Software International package. The decision to go with a packaged system also eliminated the full year's development time which the in-house group estimated would be needed to create an automated general ledger," Merchant said.

Within a 60-day period, Shipley was operational with the Software International General Ledger, and six months later the company completely cut over from its old manual system. The accounting staff, by taking advantage of the package's variable report writer feature, gained flexibility because staff members could design report formats any way they chose.

"About a year later," Merchant said, "as the IBM System/38 was about to be announced, Software International mentioned plans to drop support of the [Honeywell] 62 packages. However, Shipley was changing to the IBM System/38, so we worked out a plan to take advantage of the new computer's unique architecture and capabilities."

Merchant said that, as presently installed, the General Ledger package provides flexible product line reporting. The system is structured to mirror Shipley's product line organization accurately. Traditional profit-and-loss statements are provided vertically, and by using a matrix base, each product line is exploded. The chart of accounts and relationships file provides 10 levels of related accounts so that accountants can quickly post to the system, and all transactions are traced throughout the entire chart of accounts.

Prior to implementing the software package, the in-house system could handle less than 1,000 separate general ledger accounts. Today, Shipley has 10,000 accounts,

Introducing MARK V™ for CICS users: a *unique*, 4th generation non-procedural application development system that saves you time and money at every stage of your application life cycle. See it at a free seminar near you!

Informatics just broke the productivity barrier with MARK V, an extraordinary timesaving application development system. But, MARK V is not for everyone. *It may be for you if:*

- ☑ You need help in reducing your backlog of medium to complex CICS applications.
- ☑ You use CICS with IBM-supported data access such as VSAM or DL/I.
- ☑ Your CICS system demands highly efficient application execution.

Then, MARK V can help you produce efficient compiled applications that rival the execution of well-written COBOL—in less than half the development time!

Easy application development and maintenance is just the beginning!

MARK V improves productivity throughout the application development and maintenance cycle—not just in the coding—by providing:

- Interactive application design and simulation
- Easy to use, menu-driven specification language for development and maintenance
- Transparent and complete data access/communications control
- Automatically produced application documentation

That means, with MARK V your programmer need only specify the solution. MARK V generates the *complete* application. This methodology allows you to solve more complex problems more efficiently using less highly trained personnel—*and that saves you money!*

Reserve your place at a *free Seminar* on MARK V—the simple new way to develop and maintain your medium to complex CICS applications.

As a data processing professional, you're also a professional skeptic. But the simplicity, versatility and timesaving capabilities of MARK V are easy to see—and prove. To do so, simply mail the coupon below or call toll free. We'll reserve your place at a free MARK V Seminar in a city near you. But attendance is limited.
So mail this coupon or call *today*.

SPECIAL REPORT

Financial package increases user control

HOLMDEL, N.J. — Software vendors are used to the cautious analysis and painstaking research that always accompanies the selection of general ledger software. But, when the potential user is a software company, the supplier must be prepared for an extremely rigorous review.

When CGA Computer, Inc., a $33 million software products and consulting firm here, decided to upgrade its financial applications systems, the firm sought proposals from outside sources rather than devoting resources to develop packages in-house. However, the firm was not hesitant about devoting some of its software talent to ensuring that the best package was chosen.

"Principally, we wanted a package that would reflect current design techniques and allow for rapid expansion," said Peter Orenchuk, manager of internal systems and group leader of the selection team. "We did not want an old system that had been patched together to be everything to everybody."

Because of its user features and its ability to run on-line, CGA selected Computron Technologies' CAS/IV general ledger, accounts payable and accounts receivable systems. "One of the biggest features of the system," Orenchuk said, "is the control given to users. They do not have to understand how the system works because it comes with excellent inquiry techniques. Virtually all questions are answered on-line and within the program through interactive help facilities called Q-Mark and Q-Select."

Since practically all of CGA's more than 450 technicians are either on assignment or supporting their own software products, Orenchuk knew he would have a lean applications support team. "It was a plus that the products installed easily and required relatively little support or customization," he said. "Two days of training were all we needed. Within six weeks, we were parallel testing our financials from the beginning of our fiscal year.

"During that time, we generated 160 different reports from scratch. If those reports had to be programmed, we're talking months and months of programmer time."

Once the first run was completed, Orenchuk went to Bruce Posner, controller of consulting services, to get his reaction.

"The bottom line was that their system worked with very few glitches," Posner said. "I was able to cut closing time from five days to four. As far as I'm concerned, that is outstanding."

LEDGER from 32/32

and it generates financial statements for four product lines. Because the company now has worldwide operations, the system is being used for currency conversions.

"We often refer to our Ledger as living software," Paul Hoirtis, corporate controller, added. "As the company keeps expanding overseas, our requirements change.

"By allowing the accounting department to operate on its own, we can provide up-to-the-minute information without excessively burdening the DP department. By using the variable report writer, DP is also not saddled with extra documentation chores.

"The Software International Ledger is on-line, therefore we put a terminal directly in the accounting department.

"We also plan to install a dedicated printer in accounting, and they will not even have to depend on DP for hard copy of their reports," Hoirtis said.

AT LAST, A HIGH PERFORMANCE, RELATIONAL DATA BASE SYSTEM FOR YOUR PRODUCTION-ORIENTED VAX ENVIRONMENT.

SPECIAL REPORT

On-line system keeps subcontractors in check

AUSTIN, Texas — Underpay a subcontractor and he'll let you know loud and clear. Overpay him and you'll usually be able to get your money back — with some delay and embarrassment.

However, two firms that subcontract most of their work experience few of these payment problems because they use an on-line accounting system which includes subcontractors' status reporting.

"We are brokers of other people's services to the owner," explained Dee Lindley, president of the Ausland Construction Co., Inc. here. "We subcontract as much as we can and have a minimal field force, which is supervisory in nature. Our 'substat' report keeps us up to date as to the status of each subcontractor's program," he said. "It is instantly available, and if we have updated our cost data that morning, then our reports are current."

Ausland's system is Interactive Management Accounting Generator (Imag), an on-line construction software package written by D&S Systems, Inc. of Memphis. Designed primarily for NCR Corp. systems, at Ausland it runs on an NCR 9020 with 10M bytes of disk storage and two terminals.

At the George Sollitt Construction Co. in Wood Dale, Ill., and Seattle, "We sub out about 75% of our work," explained Controller Alfred F. Zabinski Jr. "We use Imag's subcontractors' status report, which maintains each sub's history for the life of a project. We have jobs that cost up to $17 million and last about three years." Sollitt has automated its costing and accounting procedures on an NCR 9020.

"In the past, we had a punched-card computer for accounts payable and payroll only," Zabinski said. "It took us three weeks after month end to get our general ledger posted. Now it's completed within four days."

Sollitt's Seattle office has an NCR 8150 minicomputer with a CRT and can tap into the same current job-cost and subcontractor status information as the four CRTs in Wood Dale. The 8150 transmits payroll data to the 9020. After processing, it sends back report and check information to be printed on the Seattle machine. This communications link has operated on a dial-up basis since December 1981.

Terminal display

"We can now give a project manager or a customer information such as job cost to date or labor cost to date while he waits on the phone, just by displaying it on a terminal," Zabinski said.

About 75% of Sollitt's jobs are bid and the rest negotiated. Usually the $40 million-a-year concern does its own concrete work then subs out the rest. It employs up to 300 workers during peaks.

Sollitt's Imag comprises payroll, payroll reports, job-cost reports, subcontractor status, accounts payable, accounts receivable, general ledger and fixed assets.

"Once a cost is keyed in, it immediately goes throughout the system updating everything it should," Zabinski said. "And we can get the information out easily, either in detail or in summary form."

At Ausland, the Imag modules include payroll and reports, job cost, subcontractor status, estimating, check reconciliation and general ledger. But the most important application is job costing, according to Lindley.

About 80% of Ausland's work is in negotiated design-and-build projects in the $400,000 to $700,000 range.

"In dealing with subs, Imag and the computer won't write a check for too large an amount, for example. They just won't let us overpay somebody," Lindley said.

SPECIAL REPORT

Detailed evaluation key to package selection

By Tony B. Dappe
Special to CW

If you begin with the assumption that selecting a software package will provide a quick and cost-effective solution to tight deadlines, large backlogs and slim programming budgets, you are a prime target for the marketing sales pitches and a potentially unsuccessful project installation. Software vendors thrive on this type of environment to turn a quick sale.

As a result, these packages are given to the client, and their successful installation is dependent on the client. Then the client tries to make the software packages fit the business needs of the corporation if, indeed, the business needs have been defined. This thorough evaluation is the first and most important step in avoiding missed deadlines and overrun budgets.

The first step to a successful project is to get upper management to support the project without dictating unrealistically tight time schedules and budget restraints. Management should understand that a successful installation requires an appropriate time and money commitment. A detailed work plan depicting the project team's process should be presented to upper management prior to beginning so that management will understand and appreciate what is involved in a major installation. This plan should include input from both data processing and full-time user personnel.

Another important ingredient is to have an active working review committee on hand that can speak for the areas to be affected by the new package.

Step two is to send a "request for information" with the general requirements you are trying to address to potential vendors. While this correspondence is progressing, the project team should develop a detailed set of user requirements for the new system.

These requirements do not address the solutions or the "how to," but only the specific user requirements.

The review committee established for the project or projects should be intimately involved in reviewing, agreeing on and approving the developed user requirements. These requirements are developed through extensive interviews in the user community and from expertise on the project team.

When looking for an integrated system, the final step is to combine the requirements of each subsystem into an integrated evaluation criterion. Now you are ready to begin evaluating software packages.

Know potential packages

The project team should become as familiar with potential vendor software packages as possible. This can be accomplished by reviewing the material returned in response to your request for information, attending vendor software package seminars and investigating vendor documentation on the software packages.

When your project team is thoroughly versed on your business requirements and the potential vendors' materials, it is time for an intensive questioning period with the potential vendor. Invite potential vendors to participate in the session, and instruct each vendor to have its technical staff available for this process.

Each vendor should be asked if the requirement can be met and to explain specifically how its package would satisfy the requirement. The "how" is as important as the "if" because of the inefficiencies or problems which can be caused by inappropriate solutions.

After narrowing the field to a few vendors, a final analysis should be conducted. Client interviews, a vendor home-office visit and the execution of a test case developed by our project team are good techniques. Obtain a client list from the top two vendors, and request visits to six of their clients in similar lines of business. The remainder of the project team may conduct phone interviews with the remaining clients.

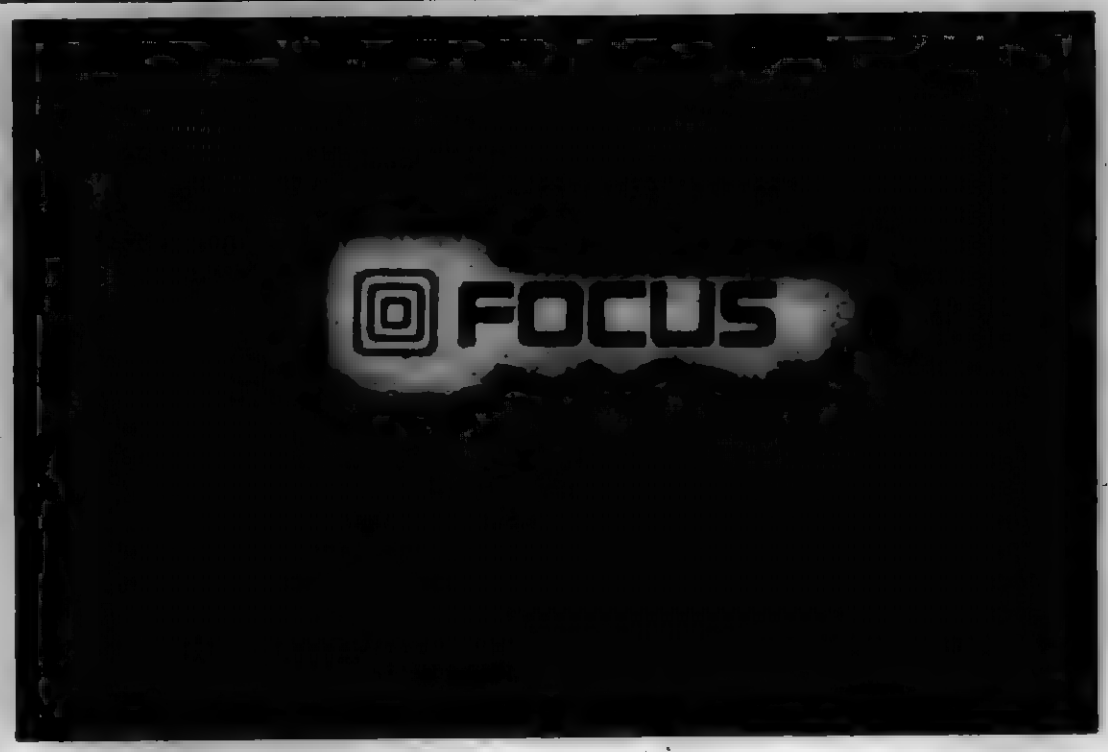
The last step, which could prove to be the most important, is the execution of a sample test case. Most vendors are not prepared to do this, or they will want to execute their own "canned" test case. A good test case could take as long as a week to execute, but the time is well spent.

With this thorough analysis, the project team should be able to make a recommendation to upper management. Once upper management gives their approval, it is time for contract negotiation.

Make sure you negotiate every substantive item up front and include it in the contract. The client has much more leverage before the selection and negotiation process is completed and the contract signed. Clients should understand that a standard vendor contract is only a starting point for negotiations.

Dappe is manager of the financial and accounting systems at Valero Energy Corp. in San Antonio, Texas.

ONE LANGUAGE. ONE SOLUTION.



THE KEY TO INFORMATION CENTER PRODUCTIVITY.

In today's Information Center environment the #1 application development tool is Information Builders' FOCUS. No other product offers the productivity and full range of functions provided by FOCUS...all within one nonprocedural language!

FOCUS' powerful relational facilities enable you to quickly build new systems. You can create new files within minutes using simple English commands, as well as query and report from existing files (VSAM, OSAM, IMS, IDMS, etc.) in your Information Center.

This increases programmer productivity by hundreds of percent, and allows end users to perform their own ad hoc queries, reports, financial modeling, graphics and statistical analysis after only a few hours familiarization.

And, there's PC/FOCUS too. It expands your PC into an Information Center with the same relational database, screen manager and data analysis facilities found in mainframe FOCUS. Plus, it enables you to download, manipulate and/or upload data extracted from mainframe files and DB's, all with full FOCUS security.

The FOCUS system. The language that unlocks productivity in your Information Center. For details write to: Don Wszolek, Dept. M5, Information Builders, Inc., 1250 Broadway, New York, NY 10001.

The Goal News

LOGICAL beats PHYSICAL

For OS/VS

LOGICAL DUMP/RESTORE OFFERS VAST PERFORMANCE GAINS

We are pleased to report that the people who have tried FAVER/XP, the "smart" backup/restore system, are pleasantly surprised at the difference Logical makes.

Most people are used to a physical-design dump & restore system. To backup a single dataset across a number of packs, they have to physically back up each pack. The logical approach of FAVER/XP lets the system back up just the dataset you want, no matter how many volumes it occupies.

You can back up clusters, groups of clusters or an entire catalog this same way. It's much easier with FAVER/XP and everything happens faster.

Plus, FAVER/XP integrity-checks all VSAM datasets for errors before it backs up anything. If it finds anything, you know about it. If everything's OK, the backup runs automatically. You can rest easy that your backups are clean.

Just to be sure, though, you can invoke the COMPARE function to ensure that the backup tape contains exactly the same data as the disk.

Works with VSAMAID/XP for total VSAM management

Goal Systems International has revealed that they have an interface between the FAVER/XP Backup & Restore system and the VSAMAID/XP system which creates the only complete VSAM dataset management system available today.

During backup, the FAVER/XP special interface creates a historical file, which may then be used by VSAMAID/XP to create a "recommendations" report. The report tells resource managers how to manage VSAM datasets for optimum space allocation [illegible]

FAVER/XP beats IDCAMS

In benchmark tests where an OS/VS installation runs backup & restore routines using IDCAMS and FAVER/XP, FAVER/XP completes the tasks required in half the time.

These figures are taken from actual timings made by product managers at Goal Systems International, the authors of FAVER/XP. They cover 100 product installations spanning five years of operation.

"The difference in speed is due to a systems design that combines the speed of a physical dump/restore with the [illegible] design philosophy of logical file access," said Theodore Pepper, Chief Developer at Goal.

Users amazed at the difference

When polled by this newspaper, users of FAVER/XP revealed that the Logical approach to backup & restore is genuinely faster, more accurate, and easier to perform.

Ralph T. Bryan, Systems Manager at Turbo Rubber Company said, "Here we had been operating all these years working our tails off just to do an accurate backup & restore. And FAVER/XP comes along and automates the task. It's about time.

"We had depreciated away our investment in our old physical [illegible]

FAVER/XP and VSAMAID/XP are great news for OS/VS installations. They are two of the Extended Productivity Systems from Goal Systems International. Both are available for a free trial. Call Goal Systems toll free today.

Risks of custom-designed tools cataloged

By Jan Hallmen
Special to CW

Recent substantial awards for damages against a major computer manufacturer because of its failure to deliver software that worked as promised have pointed out the risk involved in the use of custom-designed software.

The awards further demonstrate that this risk is as great when the software is developed by a supposedly competent system design house as when the user's own programmers write it.

The decision to use custom-designed software must be based on total trust that the person making the promise to create the software will do so in the expected time frame and for the expected cost.

Performance must be good enough so that a day's work can be done in a day, without adding personnel or computer hardware. Few professional system design houses can deliver all this. An organization that is not professionally developing computer systems can hardly expect to do as well.

Fortunately, it is no longer necessary to rely on custom-written software. Industry-standard operating systems such as Unix and Digital Research, Inc.'s CP/M have provided software developers with a large enough market for their products that they can afford to have software on the shelf.

A prospective computer user can now see his proposed system in operation before he invests in either software or hardware. He can see the functions it performs, how easy it is to use and its speed and flexibility. He can also size up the support organization behind it, which is one of the most important considerations in choosing a system.

Vendor dependence

A user of any computer software, whether custom or packaged, is highly dependent on the software vendor for training, maintenance, problem resolution and enhancements.

No business can trust the control of its operation to a system backed by a computer store specializing in games. Instead, the prospective computer buyer should look for an organization dedicated to a consultative approach to selling business systems, in which the dealer will analyze the organization's operations and recommend an appropriate system.

A prospective computer user should also demand that one party take responsibility for the computer hardware, software and support. The price of computer hardware and packaged software belies their actual complexity. Together, hardware and software compose a single system, and only a computer systems professional is qualified to analyze how they work together.

In fact, many good computer system organizations simply will not sell hardware and software separately since they must know both intimately in order to properly support their customers.

Custom-designed problem

When software is custom-designed for a user, probably no more than three people know how the system really works. Turnover of DP personnel is remarkably high, and even if the programmer stays within the same organization, he may have forgotten a lot about how your system works when you call for help.

The only realistic solution to this problem is to use packaged software and to make sure you are using an up-to-date version.

Reputable business software publishers maintain a staff of support personnel that understands the software. If your revision is more

More people in your position choose ASK.

After all the sales hype, analyses and benchmarks, the choice of a manufacturing system often comes down to a gesture of faith.

Don't make it blindly.

First consider why ASK inspires the confidence of more MIS professionals. (And why customer referral has made us the biggest in our field.)

Then consider this. Our MANMAN® software integrates manufacturing and financial operations more completely. So you'll never find yourself at a staff meeting accounting for your lack of cost accounting. Or your choice of a system.

Then consider the best part. You can fully implement MANMAN on a VAX or HP 3000 in under a year. So the information burden shifts from your shoulders sooner. And smoother. Because with our comprehensive training and documentation, your users quickly learn to help themselves to all the information they need.

Find out firsthand why more people choose ASK. Contact Carol Singh at (415) 969-4442 or 730 Distel Drive, Los Altos, California 94022. Get a customer referral. Then call and ask someone in your position about MANMAN.

What you hear will answer your every prayer.

How to control a world you can't always predict.

Cullinet's integrated manufacturing software.

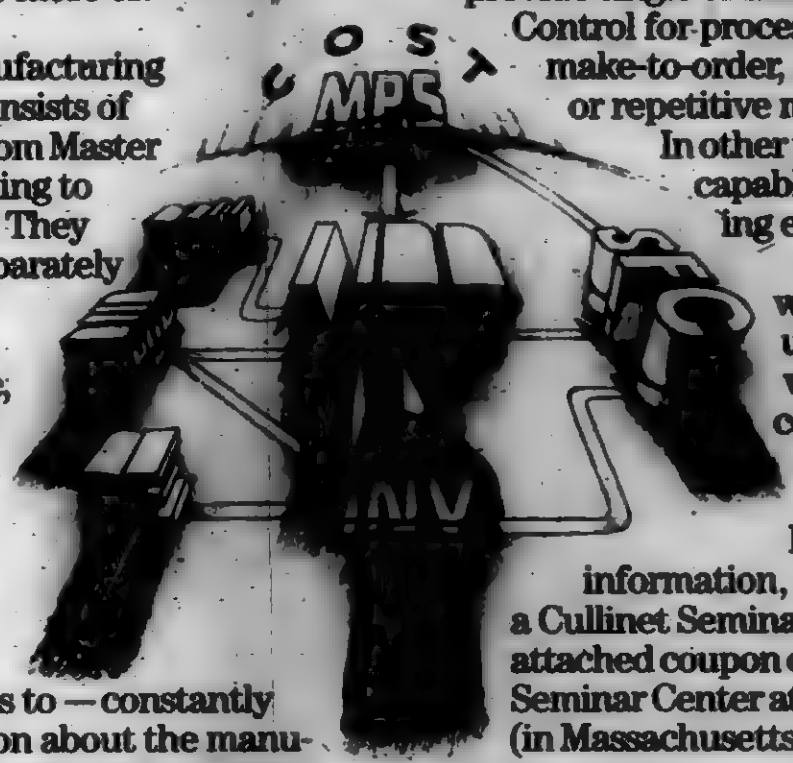
Cullinet has a software system that provides manufacturers with the one thing they could use more of: control.

A Cullinet Manufacturing Software System consists of eight applications from Master Production Scheduling to Shop Floor Control. They can be purchased separately or as a completely integrated system.

As a net-change, closed-loop MRP II system, Cullinet's Manufacturing Software provides manufacturing personnel with an accurate reflection of — and easy access to — constantly changing information about the manufacturing cycle. At any point in the cycle.

With this kind of timely information, variables that might influence inventory, resources, personnel, production, distribution, indeed, the very profitability of a manufacturing concern can be accounted for. And, once accounted for, controlled.

A very flexible system, Cullinet's Manufacturing Software can bring high-level control to any manufacturing environment however unique or personal your individual style and approach. It can provide single or multi-plant controls. Control for process manufacturing, make-to-order, make-to-stock, or repetitive manufacturing. In other words, it is equally capable in any manufacturing environment.



So even if your world changes in unpredictable ways, we can give you control over it.

Cullinet's Manufacturing Software. For further information, attend a Cullinet Seminar. Mail the attached coupon or call the Cullinet Seminar Center at **1-800-225-9930** (in Massachusetts 617-329-7700).

My Top Management Is Impeding Company Growth.

Top managers must think programmers grow on trees.

Every time a top manager comes around with an urgent request for information, I have to pull somebody off another job and put them to work writing code.

After I give my top managers what they want, nine times out of ten they come back and tell me they've changed their mind. They want the information in a slightly different format or with a few additional items thrown in. And then they've got the nerve to complain about my maintenance costs!

I'm not saying top managers don't have valid requests for information. I am saying that I'm working with finite resources. Every additional fire drill means something else gets put off. I'm nearly a week behind right now just updating my database.

How do I feel about top managers? I think we ought to lock them in the executive washroom for a month to give me time to get caught up.

SPECIAL REPORT

Al Parkinson, vice-president for information systems at J. Pascal, Inc.

Retail chain joins DP,

MONTREAL — At J. Pascal, Inc., a chain of hardware and furniture retail stores based here, C. Emmett Pearson, vice-president for finance, and Al Parkinson, vice-president for information systems, have adjoining offices in the company's executive headquarters.

The proximity of these two executives is hardly coincidental. Rather, it typifies the way Pascal is interrelating its financial and DP operations. It is also indicative of the ways Pascal is creating new computerized approaches to financial records, reporting and management systems, as well as how it views the creative use of generic software packages.

Pascal, founded in 1903, has grown over the past 80 years into one of eastern Canada's leading specialized retail and wholesale chains. With annual revenues at $210 million, the company operates 23 hardware and hard-goods stores in Quebec and Ontario provinces, four furniture showroom and warehouse outlets serving principal cities and a newly opened furniture showroom in Quebec City.

New procedures

Managers are introducing new administrative and financial procedures that place priority on the need for incisive and timely information in all phases of Pascal's operations. According to Pearson, the creative use of computerized systems is helping to make Pascal's management style even more effective. All major systems interface with the general ledger, from which all top management reports are produced.

In its headquarters here, Pascal operates a Honeywell, Inc. DPS 7

RISK from SR/62

than a year out of date, don't expect the support people to know its details. The publisher's support group is most often a backup for the dealer's own support group, which should be the first contact if you need help.

A great temptation for a prospective user of a software package is to ask that "a few changes" be made to it. This is probably the biggest mistake the buyer can make. He already recognizes that the package is appropriate to his business. What he doesn't realize is that any change made in the system will probably render his software incompatible with new revisions issued by the publishers.

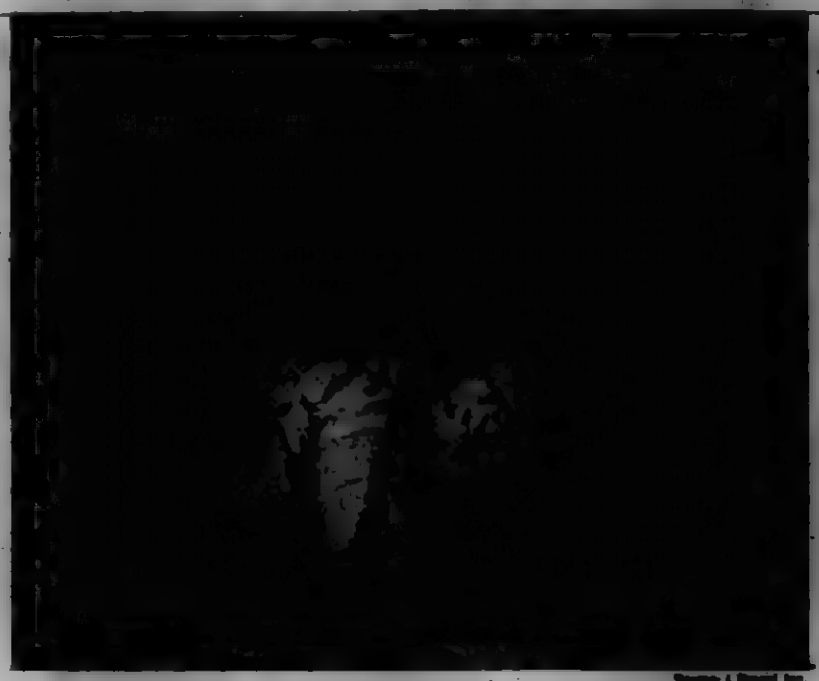
He will not only be unable to take advantage of enhancements provided in subsequent revisions, but he will lose the backing of the support organizations set up for him by both his dealer and the software publisher. The prospective user must weigh the great cost of this loss of support against the economic value of the changes.

Instead, it might make more sense to choose a different package. Software packages are now available that provide options to accommodate different ways of doing business, all within the capabilities of the package. Likewise, business software packages exist that incorporate ad hoc query languages, user-definable report writers and spreadsheet and graphics interfaces.

Other considerations for the use of software packages are implementation time and cost. Development of custom software requires detailed system design, programming and documentation. These are immediately available with packaged software, and, in some cases, training can often begin even before the hardware is installed.

The above issues are far more important than the difference in cost between custom and packaged software. In fact, for all the above reasons, using an appropriate software package, even if it costs more than custom software, may be the wisest choice.

Huffman is vice-president in charge of product development at Absolut Systems, Inc., a Boston software development house.



C. Emmett Pearson, vice-president for finance at J. Pascal, Inc.

financial operations

computer, a Level 64 computer and two Level 6 minicomputers, along with groupings of Honeywell terminals. The four retail furniture warehouses and showrooms use Honeywell Level 6 minicomputers to control stock merchandise. Data in the DPS 7 computer is maintained with Honeywell's IDS II data base system.

The close management ties between Pearson's financial services and Parkinson's data processing department are manifested in the numerous ways they integrate financial requirements with automated systems.

"The primary purpose of computer systems at Pascal is to provide management with the tools to control two essentially different operations — furniture and hard goods," Parkinson said.

Update data base

It is important that information from inventory and other systems be fed into the general ledger financial data base that is used in preparing reports for Pascal management. The goal is to maintain low, yet adequate, inventory levels as well as to get stock to where it is needed and to have adequate supplies in both warehouses and stores. Pascal's installation of several financial programs is demonstrated in this new management reporting strategy.

In early 1983, the company purchased Final IV, a general ledger and financial management system developed by New York City-based Mingham & Oellerich, Inc. In its selection of a suitable system, Pascal established a number of rigid requirements, Pearson said.

The company, intending to concentrate the use of its programming staff in retail inventory, warehousing, delivery and point-of-sale systems, required a general ledger system that would function with little assistance from the programming staff. While it recognized that retail systems constantly change due to the introduction of new technology in store automation, Pascal sought a general ledger and financial management program that was easy to maintain.

The retail chain set several interrelated objectives for financial reporting and its integration with the Final IV general ledger system. It had to increase the speed with which financial reports could be prepared and have the ability to generate special reports based on "what-if" questions. For example, if a lease was to be renewed at one store, Final IV would have to prepare break-even analysis reports that would enable Pascal management to decide whether it should renew the lease, close the store or perhaps move the store to another location. In addition, Pascal expected that the financial system would help reduce the size of the assigned clerical staff.

Pascal was confident that a general ledger system could handle the routine entry and recordkeeping functions, but it looked to Final IV to produce financial and related management reports as well. Similarly, Pascal wanted to avoid installing a separate financial modeling system, so the general ledger software needed to be flexible and powerful enough to accommodate this growing requirement.

Accounting language

Pascal said Final IV met the firm's requirements because it generates special reports through its Natural Accounting Language (NAL), which gives the accounting department the ability to create computer reports without the intervention of a programmer.

NAL enables financial managers without computer experience to create special reports, such as cash flow, sales analysis and inventory position as well as one-time reports that can show, for example, how much the company spent for car leases for its salesmen.

Final IV also prepares the standard array of general ledger and financial reports, including profit and loss, balance sheet, expense reports, budget reports and cost center analyses.

My MIS Director Is Impeding Company Growth.

Every time I want to get information out of our computer, here's the process I go through.

I submit a request to MIS.

Sometimes they're back to me in a flash, sometimes I wait an eternity. There's no predicting.

For an answer, they give me a ream or two of computer listings that I can't understand.

I sort it out only to find that MIS misinterpreted what I wanted. I got the wrong information, and I'm right back where I started.

In the meantime, the competition's making mincemeat out of my sales force.

I'm ready to hang my MIS director from the nearest tree.

SPECIAL **REPORT**

General ledger helps company pick up pace

HALIFAX, N.S. — To keep pace with its growth, an insurance company here has installed a general ledger system which has allowed it to maintain up-to-date figures and budget quarterly instead of annually.

When it mushroomed from a small insurance company to a large one in just five years, Maritime Life Assurance found that its 25-year-old accounting system could not keep pace with its growth.

"Before, it took forever to get cost summaries," according to Mary Holmes, who serves as budget controller at Maritime Life's Halifax headquarters. "Now we don't have this problem. The new quarterly cost statements require no manual calculation and can be interpreted at a glance."

After evaluating financial packages from several software vendors, the Canadian insurance company purchased the Management Science America, Inc.'s (MSA) General Ledger System in October 1981. On Dec. 17, 1982, the system was up and running.

Maritime Life's accounting department can now track product sales, complete cost reporting each quarter and maintain up-to-date figures.

Maritime Life's old accounting system, which was developed in late '50s, initially had an account structure that was easily understood, but its logic was lost over time.

In addition, the company's old card system was limited to handling $99 million, despite corporate assets totaling over a billion dollars.

Although the old system's reporting was adequate, changes presented major problems. According to Harrison Robbins, comptroller and project manager for Maritime Life's new accounting system, "it became rather cumbersome."

Maritime Life's target was flexibility. The company also wanted a system that was effective, easy to change and responsive to its expansion needs. The company was especially interested in features such as ledger and customer reporting, account reconcilement, automatic accrual reversals and automatic recurring entries. "We knew what features we wanted, so we went for it," Robbins recalled. "We tried to implement as many as possible at the outset."

Accounting tasks

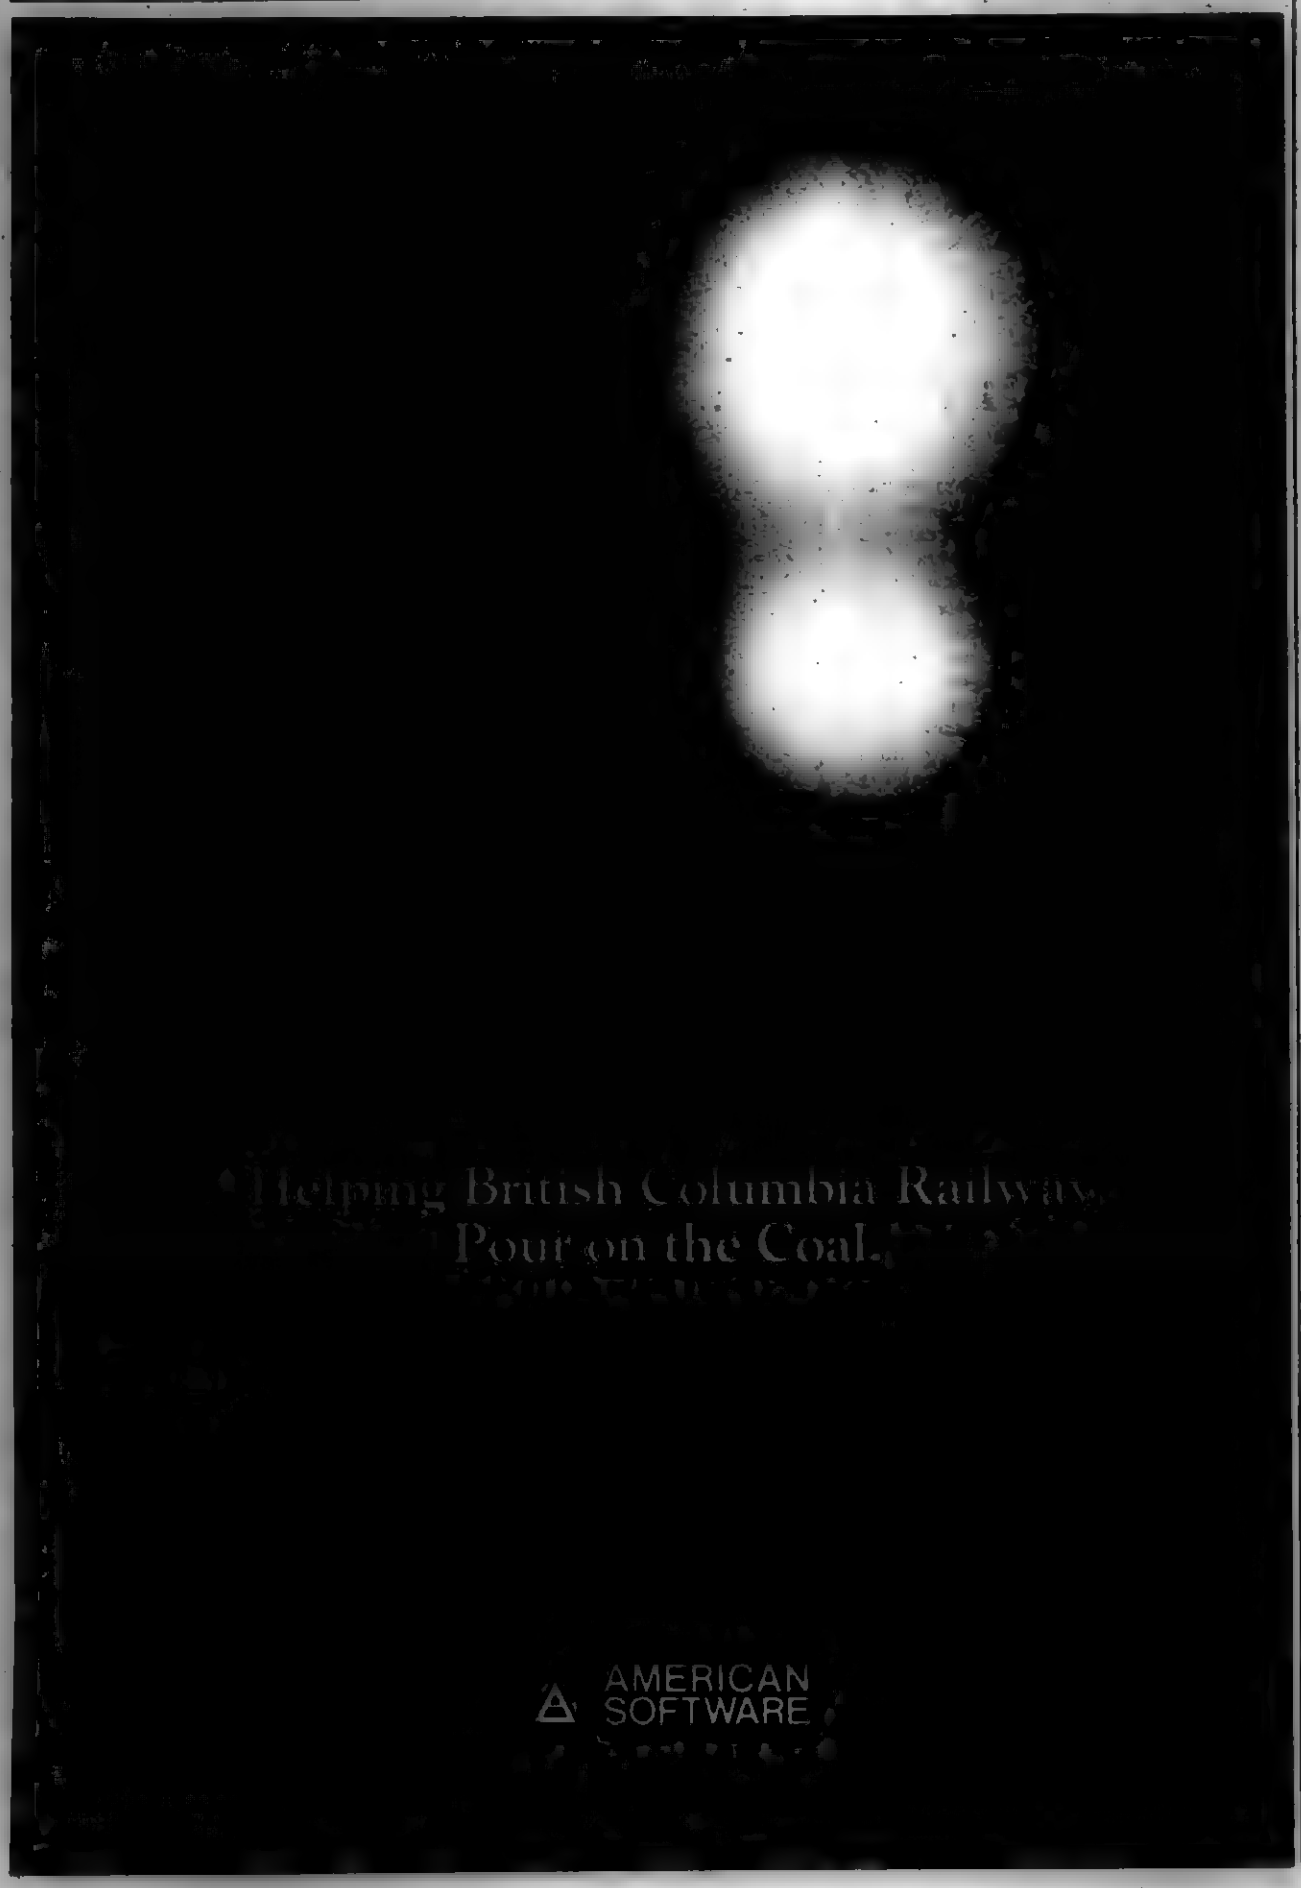
After Maritime Life's project assistant Marg Huxtable documented the old system, she interviewed people about their accounting requirements. Edith Rick, systems analyst, evaluated each accounting task, preparing to interface the new package with the administrative systems of the group and individual insurance areas. During this time, she reduced 80 computer accounting jobs to 10.

In October 1982, Wendy Paterson, test coordinator, began directing full-time testing. The purpose was to run operations through the old and new systems, comparing results. "Parallel testing lasted 2¼ months and went right on schedule," Paterson said.

"Installing the package was the easiest part of the process," Robbins said.

According to Holmes, the greatest gain is in budgeting. For the first time, Maritime Life can budget quarterly instead of annually.

Monthly reporting gives Maritime Life more accurate expense reports. "With the old system, if anything was in error — like booking something to the wrong center — nothing could be done. Now, with the expense report, we can see what's missing and clean it up right away. The result is no surprises at quarter end," Holmes noted.



Introducing the THEMIS Management Information System.™

THEMIS Gets Everyone Pointing In The Same Direction.

THEMIS gives top managers instant access to the information they need to make their company grow. That relieves MIS directors of a major programming burden thereby freeing up resources they can use to improve their company's operation.

With THEMIS top managers simply ask their computer a question in simple English. Their answer comes back in seconds. If THEMIS doesn't understand the question, it requests clarification. It's an artificial intelligence software package that makes this possible. THEMIS learns from its users, and it remembers everything it's taught.

THEMIS installs easily on any Digital VAX with a VAX/VMS operating system. It works with VAX Datatrieve or selected independent database management systems. THEMIS requires only minimal programming support.

Get everybody in your company pointing in the same direction. Ask for a demonstration today. For more information on THEMIS or on our customized artificial intelligence software capabilities, write Frey Associates, Inc., Chestnut Hill Road, Amherst, NH 03031, or phone 603-472-2800.

SPECIAL **REPORT**

Library use up 10% with on-line system

MENOMONIE, Wis.—What may be the only library in the state with an integrated circulation, catalog and acquisition system has increased its usage by 10% in the past year.

The 200,000-volume library at the University of Wisconsin-Stout moved into new quarters in January 1983 and went on-line with an automated catalog, automated checkout and check in and automated acquisition of new materials a year later. Student and staff use grew in the months that followed.

"Our use is up 10% over a year ago, and I believe it is due to a combination of our having a new facility and an on-line catalog. It's much faster, much more efficient access to bibliographic information," according to John Jax, assistant dean of Learning Resources.

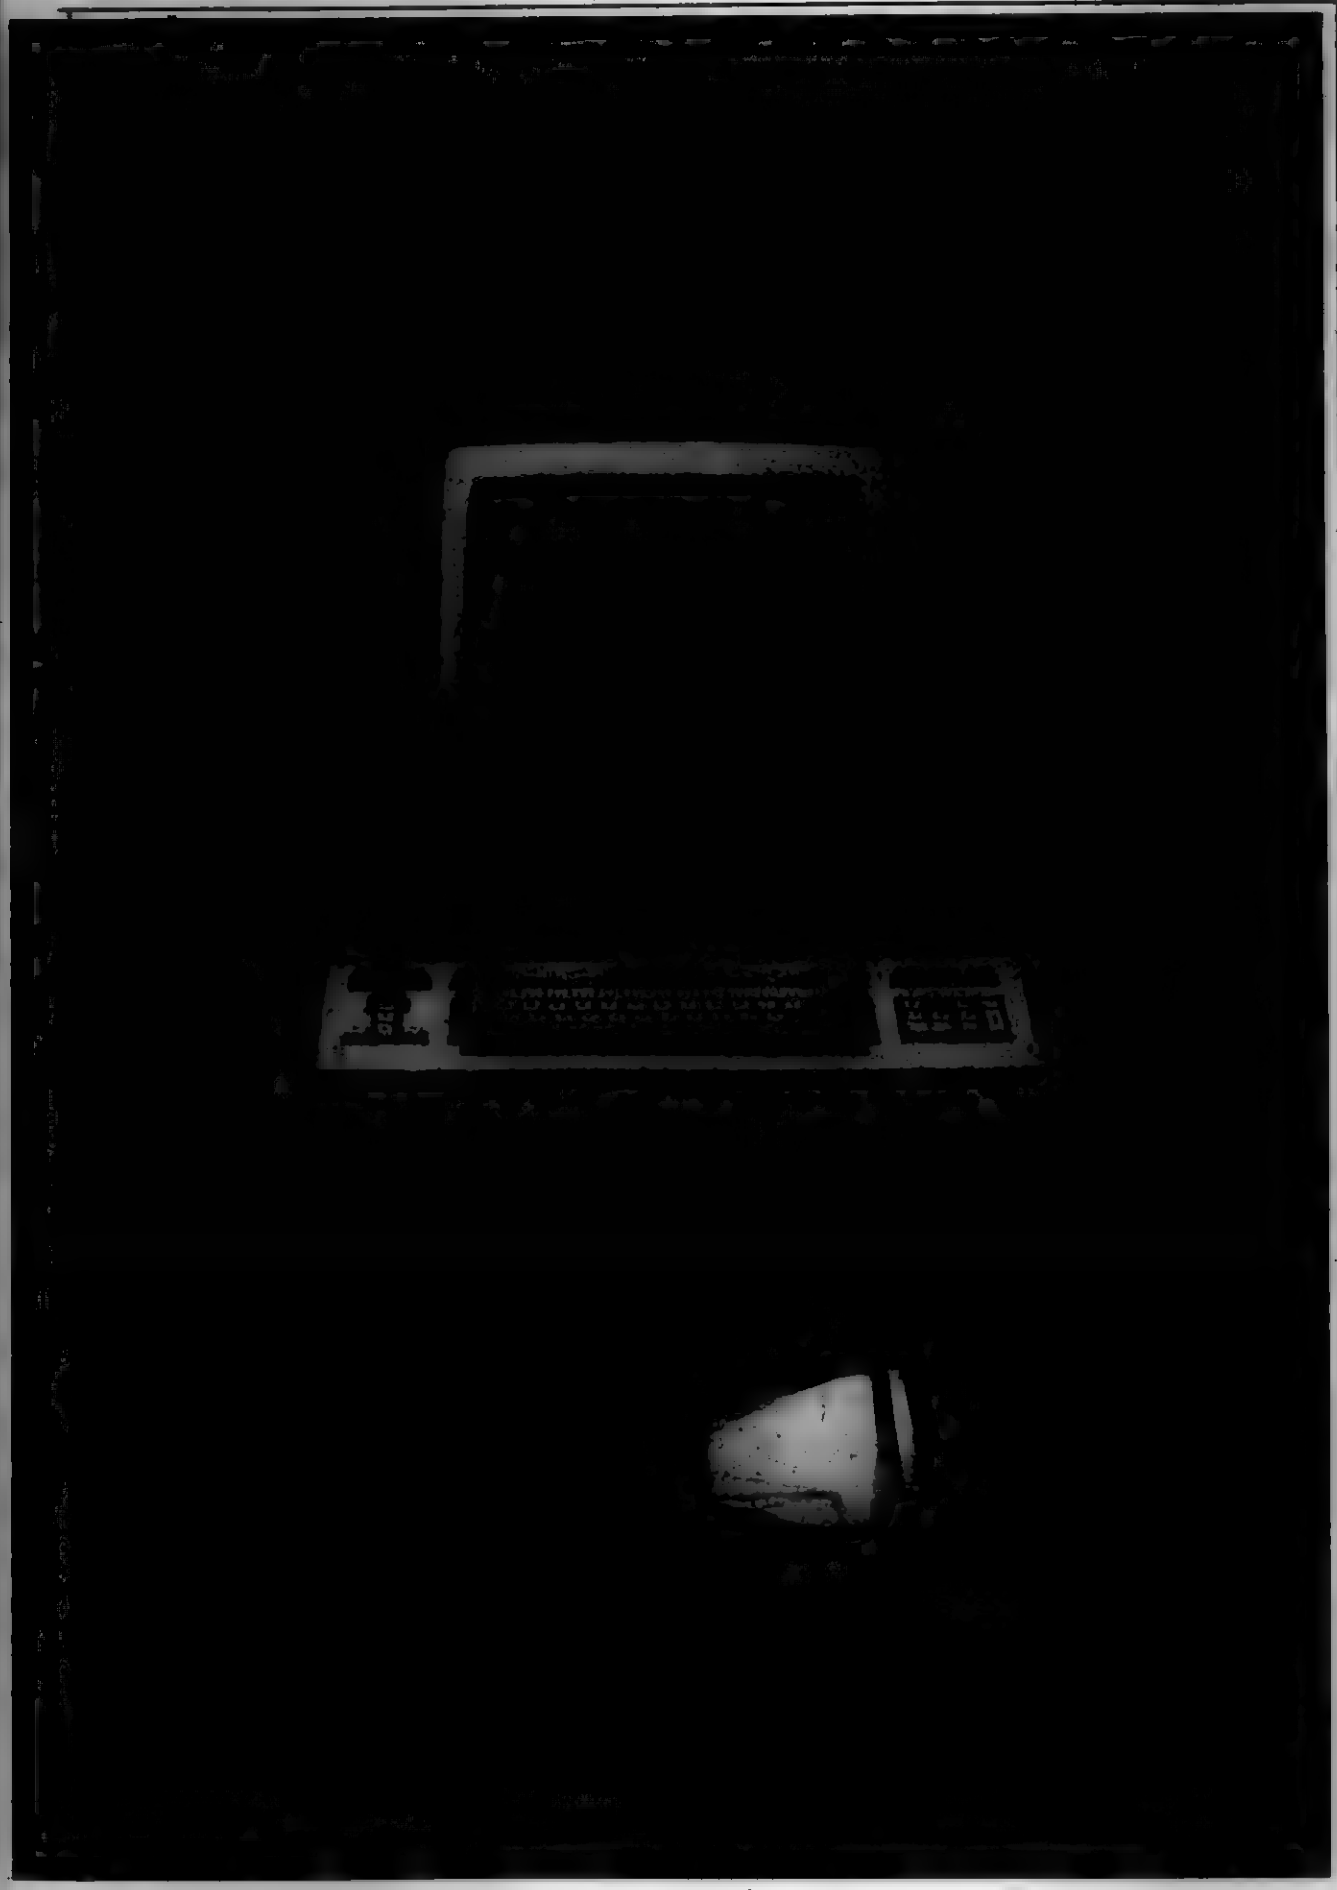
The library uses Data Phase Corp.'s Alis II software package on a Data General Corp. S/140 minicomputer. The students and library staff have access to the system through 25 Zentec Corp. Model 35 terminals.

Jax reported that the on-line catalog helps students in their research. "The computer allows you to use whichever search term you want and to get more information faster. By typing in a word or name, you get a printout showing authors, subjects and where the volumes are in the library. In the past the student would have had to copy everything down by hand."

Another feature that he cited tells the student immediately whether the book is checked out, available, on order or on the reserve list. That, he noted, "eliminates a lot of frustration" as students no longer search the stacks for books that are missing.

Each week the system mails notices to borrowers who have overdue volumes, and it records check ins and checkouts via optical character readers (OCR) "10 times faster than the old method" of shifting keypunched book cards, Jax reported. Those OCRs are used to read the codes on the volumes and on the identification card of the borrower. A due date is automatically recorded, and the transaction is added to the patron's borrowing history.

For Jax, as an administrator, a primary convenience is the system's ability to generate and track new book orders, orders that the library staff mail to publishers. While that order is being filled, the system notifies card catalog users that the book is expected soon.



Accounting system

But it also adds the transaction to an accounting system. "When we want an item we enter the author's name, the title and other relevant information. The system then kicks out an order form, but also establishes a departmental code and an account number so we can tell in a cumulative sense how much any department or faculty member has ordered in a given time. It helps us to apportion funds according to the proportion of majors on campus. That way you don't have some minor department spending two thirds of your budget," Jax reported.

The previous systems, installed beginning in 1966, were IBM, most recently a Series 4300, using keypunch and collator. Those systems, and a microfiche catalog added in 1973, offered no on-line capabilities, Jax said.

In its first year in the new $6.7 million building, the library recorded 450,000 users. For the months of February, March and April of 1983, attendance figures jumped by 28%, 25% and 33% over the same time periods for 1982. For the year 1983, usage was up 10%. Jax said that enrollment remained the same for those two years.

LOOK INTO OUR MANUFACTURING CONTROL SOFTWARE.

YOU WILL FIND OVER 700 INSTALLATIONS ALREADY BENEFITING FROM IT.

Benefiting through reduced inventory costs, increased productivity and improved customer service.

MAS-Manufacturing, the closed loop Manufacturing Resource Planning System from Martin Marietta Data Systems, has been delivering key benefits like this to hundreds of companies around the world for over a decade.

YOU WILL FIND A FLEXIBLE SOFTWARE SYSTEM AND HARDWARE INDEPENDENCE.

MAS-Manufacturing is the fully integrated on-line Manufacturing Control System with the built-in flexibility to be used in a wide variety of manufacturing companies—both large and small. And since our system is made up of integrated modules, your company can implement them as your business or budget dictates. Without the overhead of installing functions not required.

MAS-Manufacturing delivers results by synchronizing the six most critical elements of your company's manufacturing operation:

- ☐ Master Production Scheduling
- ☐ Inventory Control
- ☐ Manufacturing or Shop Floor Control
- ☐ Purchasing
- ☐ Cost Control
- ☐ Engineering Control

And we're flexible when it comes to providing you with the hardware option that meets your requirements. MAS-Manufacturing operates on *a wide variety of computer systems* from IBM mainframes and 4300 series computers (including the 4321/SSX) to Hewlett-Packard 3000's and DEC VAX minicomputers. For use on your machine or we'll supply the hardware too.

You can even use MAS through our Remote Computing Service, avoiding any hardware investment or commitment. And, because of the hardware versatility of MAS-Manufacturing, the system can easily be brought in-house in the future.

MARTIN MARIETTA

YOU WILL FIND UNBEATABLE SUPPORT, TRAINING, AND DOCUMENTATION.

As with every Martin Marietta product, you and your company can rely on us for full support. Our manufacturing and data processing specialists are always ready to assist you throughout each step of the planning, installation and implementation.

You will also find us ready to address your needs for software customization and user training. We can provide you with full maintenance services—including a special Customer Service Hotline.

And to top it off, you will be pleased to find that our documentation is as comprehensive as you would expect from an industry leader.

YOU WILL DISCOVER A GROWING MAS FAMILY OF PRODUCTS.

We recognize that there is more to a manufacturing company than manufacturing control. To meet your company's complete needs, we offer a growing family of MAS products including:

- ☐ MAS-Manufacturing
- ☐ MAS-Personnel and Payroll
- ☐ MAS-Financials
- ☐ MAS-Project Management
- ☐ MAS-Decision Support

Not to mention the 100-plus software packages offered on our remote computing services network.

We plan to continue our efforts as your total information services company by adding even more quality products to our growing MAS family.

YOU WILL REALIZE THAT RESULTS ARE ONLY A COUPON AWAY.

Whatever your manufacturing control or information services requirements, we have a system which can give you tangible, bottom line benefits. Fill out the coupon and mail it—we'll send you complete details on how Martin Marietta Data Systems products can start paying off for your company right away. Or, better yet, call us toll-free at (800) 638-7080. In Maryland, (800) 492-7170.

I'D LIKE A CLOSER LOOK.

Send me more information on MAS-Manufacturing software. Also include details on:

- ☐ MAS-Personnel and Payroll
- ☐ MAS-Financials
- ☐ MAS-Project Management
- ☐ MAS-Decision Support

SPECIAL REPORT

Firm handles decentralization with EMS

NEW YORK — Decentralized administration gave the Metropolitan Life Insurance Co. a chance to provide better policyholder service, support of the field force and a broader labor base when it shifted home office functions into nine regional head offices during the 1970s.

But despite decentralization, most insurance application paper files remained at the home office here, and the company needed a communications system to transmit both the regional officers' requests for data and the data itself.

To deal with that communications problem, Metropolitan implemented an electronic mail system known as the Administrative Electronic Message System (Adems). The basis of Adems is On-Line Software International's Omnicom package.

From a pilot project involving two head offices and the home office, Metropolitan's use of Adems has grown to include eight departments spread out over 12 locations. Adems is expected to be a key element in the Metropolitan communications network when the company places 1000 Honeywell, Inc. Level 6 minicomputers in sales offices throughout the U.S.

"We think Adems can grow exponentially in the near future as we move into our Sonic [Sales Office Network of Intelligent Computers], which is scheduled to be completed by the end of 1984," according to Michael Reilly, manager of corporate office automation.

Reilly said that a search for an electronic mail system began in 1979 and will be enhanced this month when Metropolitan implements Omni-Link, On-Line's third version of Omnicom.

The insurance company had been using Telex for interoffice communications and started the pilot program in two head offices with Telex backup, Reilly added.

"The Telex operation had many shortcomings. Its work flow was labor-intensive and time consuming. It had a high error rate because of all the people-handling that was involved in the processing of requests and transmission problems," according to Elisabeth Gabrynowicz of Metropolitan's corporate communications office.

For example, clerks in the head office prepared information forms and forwarded them to a Telex clerk, who would batch process the work and prepare a paper tape to run at a scheduled time for transmission to a support unit.

The support unit would then collate the messages, date stamp them and complete file requisition forms, which would be sent to the file division for further collating and stamping before a file clerk would search the files for the requested information, fill in the answers on the information request form and relay the form back to the Telex operator for transmission back to the head office clerk.

"With Adems, a major change was made in operational work flow for the policy requests. Since there were terminals near the correspondents and clerks, they could now key their own requests for policy information and those requests would be sent directly to a printer terminal in the head office," Gabrynowicz said. She reports that requests were received directly by the filing unit and could be answered directly.

Rise in interest

"As the efficiency and the ease of the system became more and more apparent, the other head offices started to express interest in using it," she added.

Gabrynowicz reported that since full implementation, Metropolitan has had a smoother work flow for information requests and responses, eliminated 17 handling steps for each request, saved $90,000 in Telex costs and eliminated numerous forms.

Adems, which operates on Metropolitan's IBM 3081 MVS with CICS, has saved the company $150,000 in the transmission of policy data such as medical histories and policy status updates, according to Gabrynowicz.

She declined to say what the system cost Metropolitan, but mentioned that the list price is $52,000 for a single CPU license. The company has expanded the system to include other departments, Gabrynowicz said.

"Adems has saved Metropolitan money and has improved the time service for handling our policyholders' insurance activities," Gabrynowicz concluded.

Computer Communications?

Whether it's office to office, office to corporate computer or office to data base service, Polygon software delivers reliable data transfer.

We've been developing communications software for micros, minis and mainframes for over five years. Experience that has paid off with comprehensive programs, documentation and effective menus for optimum user performance.

It's simple. Whether you use a modem, direct cabling or local area networks, our software talks directly from computer to computer. One more good reason why Digital Equipment Corporation and Interlan, Inc. sell and support our communications software with their products.

So, if you want to communicate, and you want to do it economically, reliably and easily, communicate with us...we're Polygon Associates.

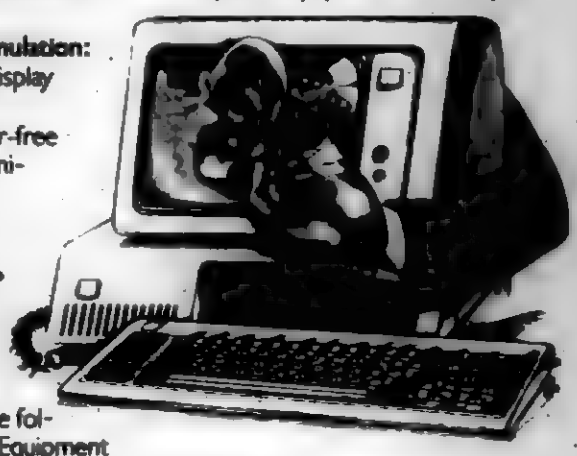
We have the software...

poly-TRM™ Asynchronous Terminal Emulation Software: For communication as a terminal to virtually any computer system including the Source[1], Dow Jones[2] and other commercial information services.

poly-BSC/RJE™ Bisynchronous Terminal Emulation: For Remote Job Entry (IBM 3780/2780) to IBM mainframes and compatible machines.

poly-BSC/3270™ Bisynchronous Terminal Emulation: For emulation of the IBM 3270 family of Information Display Systems, including file transfer.

poly-XFR™ File Transfer Software: For error-free ASCII and Binary file transfers among personal and minicomputers.



For all types of hardware...

Minicomputers using VMS, RSTS/E, RT-11 and RSX-11M Operating Systems[3]. Intel and Motorola development systems. Systems using CP/M[4], in a user tailorable version.

Plus we support personal computers from the following manufacturers: Apple Computers, Inc., Digital Equipment Corporation, International Business Machines Corporation, Jonos, Osborne Computer Corporation, Radio Shack/Tandy Corporation, Televideo Systems, Inc., Victor Technologies, Inc. and Xerox Corporation.

1 The Source is a service mark of Source Telecomputing Corporation, a subsidiary of the Reader's Digest Association, Inc.
2 Dow Jones is a trademark of Dow Jones, Inc.
3 VMS, RSTS/E, RT-11 and RSX-11M are trademarks of Digital Equipment Corporation.
4 CP/M is registered to Digital Research, Inc.

SYSTEMS & PERIPHERALS

Amdahl power aid out

SUNNYVALE, Calif. — Repeating a marketing concept it used nearly a decade ago, Amdahl Corp. recently announced a performance accelerator for its 5840 and 5850 mainframes. The processors are compatible with IBM's 3033 series of processors.

Called the 580/Accelerator, the unit allows operators to increase processor performance manually during periods of increased demand. This allows users to handle extraordinary work loads without upgrading to a larger processor, the vendor said.

Depending on the installed processor and desired performance level, users can select one of three options:

- Option 1 allows a 5840 user to increase performance to a 5850 level (a performance increase of 25% to 30%).
- Option 2 increases the performance of a 5850 processor to the level of a 5860 mainframe (a performance increase of 30% to 35%).
- Option 3 increases the performance of a 5840 processor to that of a 5860 (a performance increase of 60% to 70%).

In each case, the acceleration occurs when a console operator issues a single command. A second command restores the processor to its original performance level, the vendor said.

The accelerator will be available in the first quarter of 1984 and costs $2,500 when installed in the factory or $3,000 when installed in the field. Operating charges are $200/hour for Option 1, $275/hour for Option 2 and $475/hour for Option 3, Amdahl said.

The accelerator is virtually identical to a marketing technique Amdahl used in the late 1970s on its 470 line of mainframes, noted Jack Hart, an analyst with International Data Corp. (IDC), a Framingham, Mass., market research firm.

"I think it's a very clever idea," Hart said, noting that the accelerator options could give Amdahl the upper hand when a user is considering bids from IBM and Amdahl.

"If I were an owner of a bigger [Amdahl] model, I'd be upset," Hart said, noting that larger users are not given the option of slowing their processors down when they do not need full power, thereby paying less.

Amdahl, 1250 E. Arques Ave., Sunnyvale, Calif. 94086.

XT, Datamaster: which is better?

IBM, which historically has baffled users with overlapping product lines, appears to have added two more systems to the list.

Both the popular Personal Computer XT and the older System/23 Datamaster cost about $10,000, are based on Intel Corp. microprocessors and are geared toward the same base of small business users. In fact, the two systems are sold side by side in IBM Product Centers.

The Personal Computer XT has been one of IBM's most successful products. Over the past six months, microcomputer dealers have been unable to keep the processors in stock, and IBM has admitted it cannot manufacture the processors fast enough to fill demand. While industry watchers do not call the Datamaster a failure, they are quick to point out that the system never experienced the overwhelming success of the Personal Computer XT — even though it was on the market long before the current boom in microcomputing.

Which system is better? Industry watchers like John Hemphill, vice-president of PC Technology for Richardson, Texas-based Future Computing, Inc., said it is not so much a question of superiority but of which system best suits the user's needs. Hemphill, however, noted that technological timeliness appears to play a key role in the user's decision. One dealer in used computers, for example, noted the Datamaster is not a hot seller.

The Datamaster was announced on July 28, 1981, two weeks before the IBM Personal Computer. It was billed as an entry-level addition to IBM's line of small business computers and sported an 8-bit Intel 8085 microprocessor plus a main memory capacity ranging from 64K bytes to 128K bytes. The unit can per-

Stratus offers supermini peripherals

Stratus Computer, Inc. has announced an integrated disk subsystem, a tape drive and price reductions on disk drives for the firm's Stratus/32 line of 32-bit superminicomputers.

The integrated disk storage subsystem, called the Mass Storage Subsystem, consists of 448M bytes of Winchester disk drives. The unit also includes intelligent directors and microprocessor-based controllers. The vendor said the unit can increase raw data throughput by 45%. The unit can reportedly boost total system performance by 25%.

Up to six mass storage controllers can be connected to a single Stratus/32 processing module. Each controller can support up to eight storage directors, each of which operates a mass storage disk drive. This, the vendor said, allows a single CPU to address up to 48 disk drives with more than 21G bytes of on-line storage.

The mass storage controller handles all disk I/O operations in a reportedly fault-tolerant environment.

The mass storage director controls the access to data on a disk drive, buffered data blocks being transferred to and from the disk, and monitors status information, the vendor said.

The mass storage controller costs $9,000, the mass storage director costs $5,000, and the mass storage disk drive costs $25,000, the vendor said.

The firm also announced a rack-mount-

Caltech microprocessors may rival supercomputers

By Tom Henkel
CW Staff

PASADENA, Calif. — When linked together in sufficient quantities, microprocessors can rival the performance of the fastest processors in the world.

That is the theory that a group of researchers at the California Institute of Technology (Caltech) here are working to turn into reality. The result of their work, dubbed the Cosmic Cube, is a scientific processor made up of Intel Corp. 8086 microprocessors and Intel 8087 floating-point processors.

Currently, Caltech has developed three computer systems employing microprocessor-controlled nodes. The largest, a 64-node processor, reportedly offers approximately one-tenth the power of a supercomputer like the Cray Research, Inc. Cray-1. According to one of the Caltech project's lead researchers, Charles L. Seitz, an associate professor of computer science, the unit costs about $80,000, compared with the Cray-1's $7 million-plus price tag.

The two other processors, one with four nodes and one with eight nodes, are used for software development.

Emphasizing that it still is an experimental architecture, Seitz's co-researcher, Geoffrey Fox, a professor of theoretical physics and dean of educational computing at Caltech, said the Cosmic Cube offers potentially 1,000 times the performance of currently available supercomputers.

The advantage of the Cosmic Cube design, Seitz said, is that a virtually unlimited number of nodes can be linked to tackle a large program. Both Seitz and Fox explained that programs particularly suited for processing on supercomputers are not so much complex as they are extremely large.

Seitz pointed, for example, to a weather forecasting program that evaluates the atmosphere in every square mile on the Earth's surface and requires dealing with an enormous amount of information. The calculations necessary to evaluate the atmosphere within each square mile block, however, are not extremely complex.

Supercomputers operate by identifying similar operations (such as additions, subtractions and divisions) and performing them concurrently. However, current supercomputer architectures suffer from limits on how many concurrent operations can be performed at one time.

The Cosmic Cube architecture, Seitz explained, can be expanded with a virtually unlimited number of nodes that would, in effect, solve the concurrency limitations.

But one problem is that the Cosmic Cube's architecture does not lend itself to processing the same algorithms used on conventional supercomputers such as the Cray-1 or Control Data Corp.'s Cyber 205. While the Cosmic Cube is capable of executing the Fortran-based applications developed for supercomputers, many of those applications may have to be rewritten to take advantage of the concurrency offered by the Cosmic Cube.

Both Seitz and Fox estimated it could take 10 to 20 years before processors like the Cosmic Cube take the place of currently used supercomputers.

But Seitz believes a commercial product using the Cosmic Cube architecture may be available in about five years.

See COSMIC page 66

COMPARE from page 67

form both DP and word processing functions, drawing from a list of IBM-developed program products, according to an IBM spokesman.

The Datamaster can accommodate a 30.8M-byte hard disk drive and uses an embedded operating system that the user cannot change or alter. Black-and-white graphics capabilities are also available on the Datamaster, IBM said.

Strongest points

Perhaps the Datamaster's strongest points are its ability to use a Basic compiler, which is compatible with the Basic used on the larger IBM System/34, and its ability to connect up to four dumb terminals, making it a multiuser system.

The Personal Computer XT appears to do the Datamaster one better in almost every category.

The XT is based on a newer Intel microprocessor, the 16-bit 8086. The unit can make use of an enormous software base, namely the host of programs designed to operate under Digital Research, Inc.'s CP/M, Microsoft, Inc.'s MS-DOS or IBM's version of MS-DOS, the PC-DOS operating system. Users also have the option of switching operating systems.

The XT offers a maximum of 640K bytes of main memory, but can only use 10M bytes (20M bytes with an expansion feature) of hard disk storage when purchased from IBM. However, Hemphill noted that vendors of XT-compatible products offer hard disk drives with up to 80M bytes of storage.

The XT also tends to be a stand-alone system. Hemphill noted that multiple terminals cannot be attached to an XT processor that uses the basic MS-DOS operating system. The Future Computing analyst was also quick to point out that several XT-compatible vendors, such as North Star Computers, Inc., have skirted the multiuser question by linking XT users via a local-area network.

Overshadowed by micro boom?

One Datamaster user, Daniel Grabenstein, a business consultant in Harrisburg, Pa., said the processor may have been overshadowed by the boom in microcomputers.

Grabenstein, who uses the system to perform contract general business services, noted that while his system has worked well for the past two years and he is generally happy with it, the Datamaster lacks the ability to use popular microcomputer operating systems. Noting the popularity of such operating systems as Digital Research's CP/M, Grabenstein said he could expand his business if he could use the Datamaster to write microcomputer programs.

Hemphill noted that the advantage of either the System/23 or Personal Computer XT is in the eyes of the beholder. The Datamaster is typically sold as a turnkey system from IBM. The XT, while offering the capability to use many vendors' software packages, requires some shopping.

"Lots of customers do not use the latest and greatest hardware," Hemphill said.

STRATUS from page 67

able streaming tape drive. The front-loading unit reads and writes a standard ½-in., reel-mounted tape. In a streaming mode, the unit operates at 100 in./sec at 1,600 bit/in. The unit can also operate at 50 in./sec at 3,200 bit/in. In a start/stop mode, the drive operates at 25 in./sec.

The tape drive can be used either as a backup for data stored on disks or as a data storage unit for tape data processing applications. The unit costs $10,000, the vendor said.

Lastly, Stratus cut the price of its 14SM-byte Winchester disk drives by 22%. The units were reduced from $16,000 to $12,500.

Stratus, 6 Strathmore Road, Natick, Mass. 01760.

COSMIC from page 67

about five years.

Currently, the nodal processors consist of board-level units comprised of a total of 78 chips, including the 8086 and 8087 microprocessors and 136K bytes of random-access memory. "Physically, the machine occupies about 6 cubic feet, making it fit on the average desk, and uses 700W of power," Seitz noted.

The Cosmic Cube processors use the C programming language. Digital Equipment Corp. VAX-11 superminicomputers work as front-end processors.

The researchers are working on a second project aimed at reducing the 78-chip nodal processor to a one- or two-chip device called a Mosaic, which, Seitz said, can be as small as a micron. The scientists hope the Mosaic will be able to do everything the nodal processor can do.

While Caltech is not alone in investigating supercomputer theories based on parallel processing, Fox contended that the university is one of only a few working with an actual prototype. The Cosmic Cube research is being carried out with funding from the Defense Advanced Research Projects Agency and the U.S. Department of Energy, two organizations that have vowed to fund experimental artificial intelligence projects.

However, according to Seitz and Fox, the artificial intelligence applications of the Cosmic Cube are somewhat questionable. If Caltech is successful in developing the single-chip Mosaic, Seitz noted, such a device could be integrated into a symbolic processor to speed up voice or image processing.

DATA STORAGE

MAXELL CORP. OF AMERICA
DC 301

The Computer Products Division of Maxell Corp. of America has announced an optical disk drive.

The glass-based, 12-in. disk — Model No. DC 310 — can store 1.6G bytes of information or 46,000 pages of information when both sides are used, the vendor said. With a track density of 16,000 track/in. and a recording density of 19,500 bit/sec, recording is performed by the sector system allowing for random access.

The product is a joint development of Hitachi Ltd. and Hitachi Maxell and achieves a minimal bit error rate, the vendor said. The disk, in addition, can be linked into Hitachi's Hitfile 60, an optical disk storage system designed for document filing and mainframe linkup, according to the vendor.

The optical disk sells for $200. A two-sided disk costs approximately $300.

Maxell Corp. of America, 60 Oxford Drive, Moonachie, N.J. 07074.

AVIV CORP.
TFC 825; TFC 925

Aviv Corp. has announced a series of magnetic tape controllers designed for compatibility with Digital Equipment Corp. TS11 controllers.

The TFC 825 and TFC 925, each available in three versions, are offered for use with DEC LSI-11, PDP-11 and VAX series processors using 800, 1,600, 3,200 and 6,250 bit/in. drives.

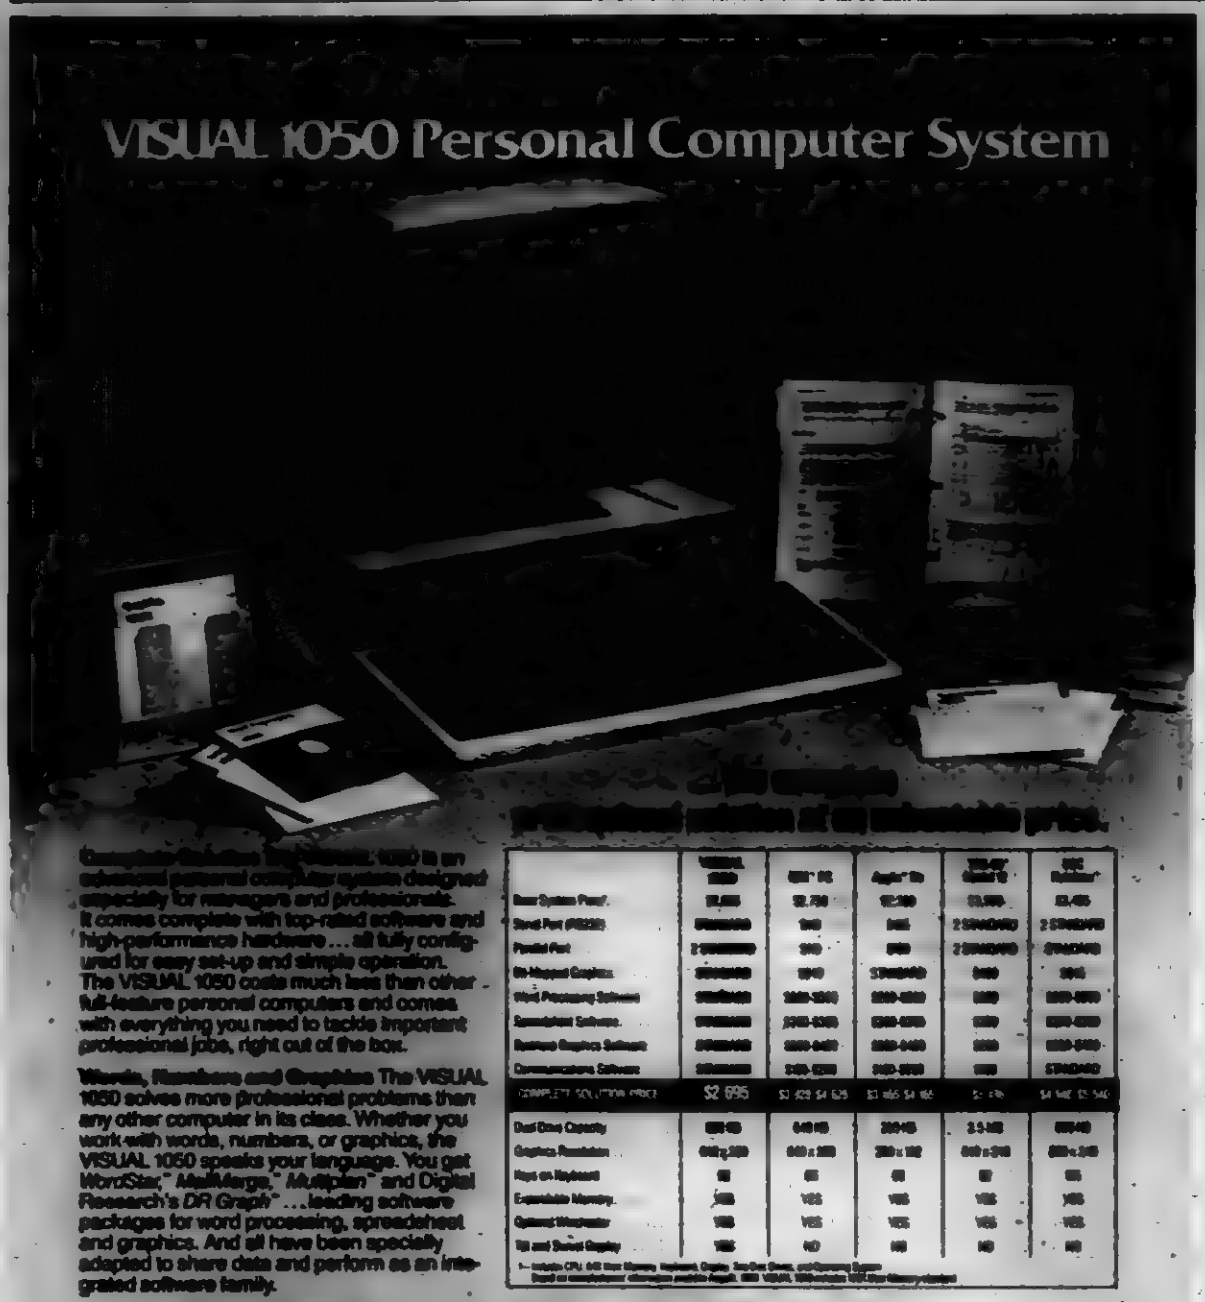
Of the three versions available, one is for use with Pertec Computer Corp.-type streaming and formatted start/stop drives, another for low-speed (50 in./sec) Storage Technology Corp.-compatible group coding recording start/stop drives and the third for high-performance (125 in./sec) Storage Technology-compatible group code recording start/stop drives, according to the company.

The TFC 825 reportedly is a DEC Unibus-compatible, single hex-size board. The device is transparent to DEC and Bell Laboratories versions of Unix.

The TFC 925 is said to be compatible with the DEC Q-bus and a single quad card controller. It reportedly has the same features as the TFC 825, as well as 22-bit addressing and block mode direct memory access transfer.

The products are available for $2,950 each.

Aviv Corp., 26 Cummings Park, Woburn, Mass. 01801.



Unbeatable Value $2,695 is the total retail price for the VISUAL 1050. You get the best and most popular software packages, ready to run on hardware which offers the features and quality you should demand. Two high capacity disc drives. 128K memory standard. Fast, bit-mapped graphics. Full size green screen.

Standard printer and communication ports. Rugged 93-key keyboard with special WordStar engravings. You can't buy a more complete hardware and software solution at anywhere near the price.

See for yourself*

PROCESSORS

CAMBRIDGE DIGITAL SYSTEMS, INC.
System 58

Cambridge Digital Systems, Inc.'s System 58 line of desktop Digital Equipment Corp. Q-bus-compatible minicomputers is available in higher performance configurations that are said to incorporate larger capacity Winchester disk drives and a variety of removable media mass storage devices.

System 58 is integrated with DEC's PDP-11 family. Processor options for the System 58 include the DEC LSI-11/73, LSI-11/23 Plus, LSI-11/23 and Cambridge Digital's own Motorola, Inc. 68000/68010-based Univac CPU.

Greater mass storage capacities are now available with the 10.4M-, 20.8M- or 41.6M-byte Winchester drives.

The mass storage subsystems reportedly emulate DEC'S RL01 and RL02 drives on an RLV22 controller. Optional backup devices for the System 58 include removable cartridge disks or floppy diskettes.

The System 58 is priced from $8,000.

Cambridge Digital Systems, P.O. Box 568, 65 Bent St., Cambridge, Mass. 02139.

TERMINALS

SCREEN DATA CORP.
Power Screen

Screen Data Corp. has introduced a dynamic microfilter, the Power Screen, said to eliminate the static electric field which surrounds the face of a video display terminal.

The static electric field reportedly can cause skin discomforts and can also be a source of microcircuitry failure.

The vendor said computers can generate a static charge of up to 50,000V, creating a positive-ion electric field.

The Power Screen eliminates static electricity and blocks out reflective light with identical features found in the vendor's standard antiglare screen.

The antiglare screen's nylon microfilter attaches to the face of the computer terminal, and 100 different models in various sizes fit most of the available 400 CRT terminal makes and models, according to a spokesman for the vendor.

The Power Screen costs $49.50, and the antiglare screen costs $39.50.

Screen Data, 240 Cedar Knolls Road, Cedar Knolls, N.J. 07927.

PINETREE COMPUTER SYSTEMS, INC.
DP 2502 portable terminal

Pinetree Computer Systems, Inc. recently announced the DP 2502 hand-held data capture, data entry computer terminal to be used in con-

SYSTEMS & PERIPHERALS

junction with two data receivers, the DPR 1002 standalone receiver and the DPR 1012 15-in. circuit board that resides in an IBM Personal Computer.

The DP 2502 reportedly provides fully integrated, two-way communications, transmitting captured data over standard telephone lines at 1,200 bit/sec to either model data receiver. The receiver accepts the data, reformats it as required by the host computer and delivers the data to the host at 9,600 bit/sec.

The hand-held terminals are priced at $895, the DPR 1002 is $2,350 and the DPR 1012 is $1,750.

Pinetree Computer Systems, Suite 3000, 8600 Freeport Pkwy., P.O. Box 610883, Dallas, Texas 75261.

FUJITSU SYSTEMS, INC.
Fujitsu 7990

Fujitsu Systems, Inc. has introduced a point-of-sale master terminal that reportedly can support up to 10 Fujitsu 7880 slave terminals.

The Fujitsu 7990 features plasma display, 256K bytes of random-access memory (RAM), 384K bytes of bubble memory, a 128K-byte removable bubble memory cartridge and an RS-232 interface. Options include an internal modem and up to 1M byte of bubble memory.

According to the vendor, the product is geared toward stores with 10 terminals or less that handle a large number of transactions each day. The plasma display is said to improve data entry and reduce training time.

The terminal will be available in September for $7,695.

Fujitsu Systems of America, No. 620, 9841 Airport Blvd., Los Angeles, Calif. 90045.

PRINTERS/ PLOTTERS

INNOVATIVE ELECTRONICS, INC.
Innovator 202-FC

Innovative Electronics, Inc. has announced extended communications capabilities for its Innovator 300 line/min printer subsystem.

The Innovator 202-FC is said to provide emulation of IBM 2780 and 3780 terminals.

It reportedly supports space compression and expansion, processor interrupt reception, conversational mode, reception of Ebcdic transparent data, component selection, vertical format control and horizontal format control.

The system is controlled by a micro-based, single-board computer system. The programmable controller is used to implement complex communications protocols.

It also is said to feature a comprehensive set of diagnostics, designed to allow the user to verify proper operation of the printer system.

The printer uses heavy-duty chain technology and has a nominally rated print speed of 300 line/min and 400 line/min with use of a 48-char. set.

It is available in 132-col. and 80-col. models.

The 132-col. printer is priced at $5,495.

Innovative Electronics, 4714 N.W. 165th St., Miami, Fla. 33014.

MICRO PRODUCTS CO. DIVISION OF C3, INC.
MPC 2150

The Micro Products Co. Division of C3, Inc. has announced a bit-mapped, eight-color graphics terminal, designed to emulate the Intelligent Systems Corp. Intecolor 8301R terminal.

The MPC 2150 reportedly features a 48-line by 80-col. display which may be overlayed by a pixel-addressable graphics display yielding a resolution of 480 pixels by 384 pixels.

It also is said to offer 16 shiftable and 32 programmable function keys on an extended keyboard as a standard feature.

Other features reportedly include English-language set-up menus stored in nonvolatile random-access memory and multiple pages of video memory to allow local and on-line editing of graphics designs and text.

Shipments are scheduled to begin in the third week of February.

The MPC 2150 is priced at $3,995 in single-unit quantities.

C3, 11485 Isaac Newton Sq. S., Reston, Va. 22090.

Only one disk guarantees safe passage through the torrid zone of drive heat. Maxell.

A lifetime warranty. And manufacturing standards that make it almost unnecessary.

Consider this: Every time you take your disk for a little spin, you expose it to drive heat that can sidetrack data. Worse, take it to the point of no return. Maxell's unique jacket construction defies heat of 140°F. And keeps your information on track.

And Maxell runs clean. A unique process impregnates lubricants throughout the oxide layer. Extending media and head life. How good is Gold?

Maxell's the disk that many drive manufacturers trust to put new equipment through its paces. It's that bug-free.

So you can drive a bargain. But in accelerated tests, Maxell floppys lead the industry in error-free performance and durability. Proving that if you can't stand the heat you don't stand a chance.

maxell.
IT'S WORTH IT.

Maxell Corporation of America, 60 Oxford Drive, Moonachie, N.J. 07074 201-440-8020

SYSTEMS & PERIPHERALS

PRINT from page 71

VECTOR GENERAL, INC.
VG 8250 enhancements

Vector General, Inc. has announced enhancements for its VG 8250 computer-aided design and manufacturing (CAD/CAM) graphics display system which the vendor said will increase the system's cost effectiveness.

The enhancements are reportedly a mini version of the VG 8250's channel control unit, which can support four sites, and a mini version of the firm's remote display controller, capable of supporting four stations. The enhancements take the form of monochrome stroke monitors. Ergonomic improvements include a ratio CRT and a low-profile function switch box.

The firm also added firmware to enhance CAD/CAM display processing functions contained in the mini remote display controller. Vector General's Color Stroke Shadow Mask Display Station is an option to the controller.

The VG 8250 is a plug-compatible replacement for the older IBM 3250 display system; it is used with IBM and IBM-compatible computers. The channel data control unit, the remote data control unit and four display station monitors cost $93,500.

Vector General, 31300 Oxnard St., Woodland Hills, Calif. 91367.

EVANS & SUTHERLAND COMPUTER CORP.
PS 330 price reductions

Evans & Sutherland Computer Corp. has announced price reductions of approximately 40% for its PS 330 graphics systems.

Company officials said improvements in the underlying integrated circuit technology have decreased the cost differences between high-performance and low-performance systems.

The price for the PS 330, consisting of a control unit with 1M byte of memory, a 19-in. color calligraphics display, a keyboard with 12 function buttons and a data tablet, has been reduced from $84,995 to $48,000.

The price for the system with a black-and-white monochrome display has been reduced from $60,000 to $40,200.

The new prices are now in effect.

Evans & Sutherland, 580 Arapeen Drive, Salt Lake City, Utah 84108.

BOARD-LEVEL DEVICES

1ST SOLUTIONS; CYBERSYS, INC.
4M-byte memory board

1st Solutions and Cybersys, Inc. have jointly announced a 4M-byte memory board for Prime Computer, Inc. systems.

The product occupies a single standard board slot and provides 4M bytes of error-correcting memory for Prime Models 150 through 850 and the 2250.

According to the vendors, the board may be interleaved with another 4M-byte board or up to four 1M-byte boards.

Orders are being accepted, with delivery within 30 days. The price is approximately $20,000.

1st Solutions has also announced an upgrade plan whereby existing Cybersys P1024 memory boards can be upgraded to 4M-byte capacity, with a 30-day lead time.

1st Solutions, Suite 107, 2001 E. Campbell, Phoenix, Ariz. 85016.

MOTOROLA SEMICONDUCTOR PRODUCTS, INC.
VM03 single-board microcomputer

Motorola Semiconductor Products, Inc. has introduced a single-board microcomputer said to add virtual memory plus hardware memory management features to its Versamodule family of micro system components.

Model VM03 reportedly incorporates a Motorola, Inc. 68010 virtual memory micro processing unit operating at 10 MHz, plus a 68451 Memory Management Unit to afford relocation and protection of user tasks.

Features include a Versabus Interrupt Handler and Interrupter and I/O channel interface.

Model VM03 costs $3,900 for quantities of one to five.

Motorola Semiconductor Products, P.O. Box 20912, Phoenix, Ariz. 85036.

NETWORKING VS. NOTWORKING:

ANNOUNCING THE NET RESULTS.

Linking micros to mainframes is one of the most pressing problems facing DP managers today. How do you bring all the computers in your company together so they can share information, resources, programs, and access the corporate data base without any loss of security?

SyFAnet

Networking is a nice concept but it won't work unless you have a system that works.

SyFAnet™ (System For Access network) is the network that works. The only complete solution on the market, ready to meet all your networking needs now.

SyFAnet gives you everything you ever wanted in a network: the ability to link PCs together, multi-function workstations, industry-standard software, global information access and unlimited expansion capabilities. All fully-integrated, and built upon a foundation of proven hardware and software.

Picture a powerful processor for every purpose—one for applications, another for sharing resources. This special architecture makes SyFAnet a more reliable network, with no single point of failure. Every time you add a terminal, you gain more power instead of losing it.

Our broadband bus offers more flexibility. So you can add more users whenever and wherever you want.

By adding microprocessor-based workstations and CP/M-86, SyFAnet gives you more functionality, too. You can upgrade easily without costly conversion, because our software remains the same at all levels.

And while *you* might get confused by the flurry of message traffic in the office, SyFAnet never does. Its unique version of collision avoidance means data doesn't get lost in the shuffle.

Because business doesn't stop at borders anymore, SyFAnet was designed with the whole world in mind. SNA and X.25 capabilities connect you to mainframes and networks around the world.

SyFAnet. Ready to solve your networking problems today and tomorrow. It's the network that works.

For more information, write or call today.

MICROCOMPUTERS

Betamax decision won't hurt users

micro BITS

TOM HENKEL

What implications does the U.S. Supreme Court's ruling in the Sony Corp. Betamax case hold for microcomputer users? In a matter of speaking, the jury is still out; but experts tend to agree the impact on microcomputer users, especially corporate users, will be minimal.

The Supreme Court ruled that it is permissible to copy, for private use, television programs that can be received free over the airwaves.

While few microcomputer programs can be found floating around in the atmosphere, some of the underlying issues in the case may affect the micro sect.

For example, New York attorney Herbert Swartz noted that for the first time, the court has ruled it is permissible to make complete copies of a copyrighted document — in this case, a television program.

Permissible to copy?

Does that mean it is also permissible to make single complete copies of software programs? Maybe, Swartz said, if the person doing the copying is clever. Can you make wholesale copies of Visicorp's Visicalc for 500 corporate executives? No, that is still illegal. And don't hold your breath waiting for the situation to change.

"I don't think anyone can conclude (the Supreme Court's decision) is an open invitation to record software in a commercial setting," noted Washington, D.C., attorney Jon Baumgarten, a partner in the firm of Paskus, Gordon and Hymen.

Baumgarten said the Betamax decision will actually make it harder for corporations to copy software blatantly, because in ruling that copies of copyrighted material can only be made for private, home use, the court has more clearly stated that copying software for commercial use is wrong.

Clearest message

What may be the clearest message from the Supreme Court ruling probably means little to micro users. In making its decision, the court ruled that manufacturers of recording equipment, such as video cassette recorders, cannot be held liable for the legal abuses of their customers.

But in the computer industry, that is a moot point. In 1980, the U.S. Congress ruled that it is permissible for computer users to make backup, or archival, copies of software and data. And equipment to make such copies can legally be bought and sold.

What the Supreme Court's decision has failed to address is the practicality of enforcing copyright laws. The corporation that makes multiple copies of microcomputer software for internal distribution is most likely breaking the law. But catching up with the offenders is another story.

Tom Hemnes, a partner in the Boston firm of Foley, Hoag and Eliot, noted "in large-scale copying, one tends to find out about it." Using the example of a corpo-

Portable mart to tighten

Vendor opportunity remains

By Eric Sander
Special to CW

Times are good for the companies tagging along behind IBM's Personal Computer with Personal Computer-compatible portable micros. This corner of the personal computer market features some of the industry's greatest success stories.

But this happy condition won't last indefinitely for portable computers, according to industry analysts, who warn of much rougher competition just over the horizon. International Resource Development, Inc. in Norwalk, Conn., predicts "kamikaze" price wars. "A year from now, it'll be a very difficult market," said Aaron Goldberg of International Data Corp. in Framingham, Mass. "The easy windows are going to close."

These predictions sound very much like those for the overall industry, and the reason is straightforward: For the most part, this is not a niche market.

Two long-term developments are blurring the edges of the market. First, most manufacturers of portable micros increasingly emphasize other features (price and software availability) over portability. Ask them about their competition, and they usually mention desktop computers. And second, many suppliers of 8-bit portables have undertaken the long trek toward Personal Computer compatibility.

A large portion of this big market also wants, or thinks it needs, an IBM-compatible machine. Like many other dealers, Bob Wolff of Wolff Computers in New York said there's "tremendous hype" for Personal Computer compatibility, but he added that "we want to be in on the hype."

And, of course, the sales. Future Computing, Inc. of Richardson, Texas, predicts that about 800,000 Personal Computers and Personal Computer-compatibles will be sold this year in the U.S., 90,000 of them portables for business use. Next year, the total will rise to more than 1,620,000 systems, including 180,000 portables.

See PORTABLES page 74

'Espionage-proof' portable debuts

MOUNTAIN VIEW, Calif. — Grid Systems Corp. recently announced what it calls "the first espionage-proof portable computer," featuring twice the random-access memory (RAM) of previous Grid models.

The company also announced a 256K-byte RAM entry-level micro, a 512K-byte micro with built-in modem and a 17% price reduction of the model formerly known as Compass.

GRiD

The Model 1107 microcomputer provides 512K bytes of RAM, along with 384K bytes of nonvolatile bubble memory. Encased in magnesium to resist detection and decoding of radio signals that may be emitted by unshielded computers, the product weighs 13½ lb, will fit in a space the size of half a standard-size briefcase, houses a full-size, flat-panel screen and uses Intel Corp. 8086 and 8087 microprocessors, according to a spokesman.

The entry-level product, Model 1100, also reportedly features Intel 8086 and 8087 microprocessors and flat-panel screen, weighs 10 lb and features 256K bytes of RAM and 384K bytes of bubble memory.

The Model 1109 features a 300/1,200 bit/sec modem and 512K bytes of RAM using 256K-bit chips developed by Hitachi Ltd.

The Compass, now renamed the Model 1101, offers the same features as the Model 1100, along with the 300/1,200 bit/sec modem, according to the vendor spokesman.

Prices for the product line are: Model 1107, $12,495; Model 1100, $5,995; Model 1101, $6,795; and Model 1109, $7,995, the vendor spokesman said.

Grid Systems, 2535 Garcia Ave., Mountain View, Calif. 94043.

STM introduces transportable micro

MENLO PARK, Calif. — STM Electronics has announced a 17-lb, IBM Personal Computer-compatible transportable computer said to feature an integrated 16-line LCD, 40-col. thermal printer, modem and data communications abilities, built-in speaker phone, software and execution time almost as fast as the IBM Personal Computer.

The STM Personal Computer comes standard with a 16-line by 84-char. LCD with 540- by 200-pixel resolution for graphics.

An expanded display capability for standard video monitors supports "windowing" software and allows the user to choose between a 25-line by 80-col. and a 132-col. display with 640 by 400 pixels for high-resolution graphics.

The unit features 256K bytes of random-access memory, expandable to 512K bytes, and has dual 1M-byte floppy disk drives. These double-sided, double-density drives give the user a total of 1.6M bytes of formatted storage and roughly 1,200 pages of text and eliminate the need for add-on disk drives.

This feature gives the STM Personal Computer the largest standard floppy disk storage capacity of any transportable computer, the vendor claimed.

The product is driven by Intel Corp.'s 80186 microprocessor, which is compatible with both the IBM Personal Computer and Microsoft, Inc.'s MS-DOS 2.0.

An automatic dial and answer direct connect modem for data communications is also offered. Programmable between 300 and 1,200 bit/sec, the modem supports electronic mail, telex and networking with other STM Personal Computers and provides access to some information systems, the vendor said.

Prices for the STM Personal Computer will begin at $3,000. A desktop version will be priced starting at $2,500.

STM Electronics, Suite 250, 530 Middlefield Road, Menlo Park, Calif. 94025.

PORTABLES from page 73

Strictly speaking, nothing in this world is fully IBM-compatible, except the Kit 1 from Colby Computer in Palo Alto, Calif., which allows users to repackage their Personal Computers in a portable unit. Compatibility depends on the system's ability to mock exactly IBM's copyrighted read-only memory instructions and the individual software package's use of direct hardware calls (which bypass the operating system). In short, it's a black art.

Meanwhile, there's a host of other contenders, both established entries and start-ups, each with its own strategy, despite a wide perception that the window is closing. Because start-up costs are high, critical components are in short supply, and retail shelves are jammed.

Strategic Technologies, Inc. of Norcross, Ga., plans to sell a "PC Traveler" model, which features a plasma screen display, dual Intel Corp. 80186 chips, a built-in printer and 6M bytes of hard disk cartridge storage. The company plans to build at least 13,000 systems in 1984. Ivy Microcomputer Corp. in Wilmington, Mass., plans to augment dealer sales for its new Personal Computer-compatible portable with distribution through department stores.

At the same time, just about everyone else in the marketplace from Apple Computer, Inc. to Victor Technologies, Inc. is expected to introduce a portable personal computer. To complicate matters further, several other interesting lightweight, 16-bit machines now available are not positioned as IBM-compatible portables but may indicate future competition.

These are the Mobile Office from Gavilan Computer Corp. in Campbell, Calif.; the Model 1101 (formerly Compass) from Grid Systems Corp. of Mountain View, Calif.; and the PC-5000 from Sharp Electronics Corp. in Paramus, N.J.

These machines have base prices ranging between $2,000 and $9,000 and very different configurations. They are aimed at very different customers, but they all weigh less than 15 pounds and run Microsoft, Inc.'s MS-DOS.

Some in the industry expect notebook-size computers like the PC-5000, which has an 8-line, 80-char. LCD screen, to compete in a broader market when the displays are full size. Sharp Marketing Manager Lou Ferri said that Sharp could provide a 24-line screen now, but will wait until that seems cost-justified. For many applications, the current display "is not a problem," Ferri maintained. "You're looking at one-third of a standard 24-line screen, and we feel that's adequate."

The one question in the future of portables is IBM. Future Computing thinks IBM plans to introduce a portable business system. The research firm forecasts that Big Blue will ship 40,000 such systems next year, according to analyst William Ablondi, although Future hasn't fleshed out details on what the product will look like.

Many others doubt IBM will bother. "It's ridiculous to think that IBM would introduce a product that would compete with the [Personal Computer], although the Peanut might run some [Personal Computer] software," said Herbert Kummer, marketing director at Seequa Computer Corp. in Annapolis, Md.

Another concern is what happens when IBM's production capability begins to catch up with demand. "To a certain extent, we'll all enjoy IBM's inability to deliver enough," according to Otrona Advanced Systems Corp. President James Lindner. But, like others, he predicts that even if two million Personal Computers roll off IBM's assembly lines next year, an enormous market remains for other manufacturers.

"The market is so big that everyone can play," Kummer said. A Compaq Computer Corp. spokesman noted the IBM shortage, but pointed out that "there's been a shortage of [Compaq Computer] Compaqs too — I don't know to what extent that's benefited IBM." Slightly more seriously, another Compaq spokesman said that if IBM ships two million Personal Computers, the company's position will be enhanced by further acceptance of the Personal Computer de facto standard.

So despite the predictions of hard times down the road, the present looks highly promising. There's room for many contenders, Goldberg said — "if they run their businesses very well."

Eric Bender is an Associate Editor of Micro Marketworld, *a sister publication of* Computerworld, *in which this article originally appeared.*

COPIES from page 73

ration making copies of microcomputer software for about 500 micros, there will probably be about 2,000 employees who may suspect the company is illegally copying software.

With that many people in on the corporate secret, word is probably going to get back to the software vendor. A small corporation or a home user, on the other hand, is much more difficult to detect.

Hemnes compared the software copier to a counterfeiter, noting that in many cases, it is only when both get greedy that they are usually discovered.

MICROCOMPUTERS

SYSTEMS

NORTH STAR COMPUTERS, INC.
Horizon 8/16

North Star Computers, Inc. has announced a version of its Horizon 8/16 microcomputer preconfigured for two users which will allow customers to buy the new multiuser, multiprocessor computer with a 5M-byte hard disk.

The Horizon 8/16 system can support up to eight users for less cost than the initial two-user bundles, the vendor said. A 15M-byte Horizon 8/16 for eight users would cost less than $1,300 per user.

In addition, a two-user Horizon 8/16 configuration is available with a 30M-byte hard disk for $7,699. A 15M-byte, two-user configuration sells for $6,699, and the 5M-byte hard disk for two users costs about $2,600 per user, the vendor said.

North Star Computers, 14440 Catalina St., San Leandro, Calif. 94577.

AUTOGRAPHIX, INC.
Autographix 200

Autographix, Inc. has introduced the 200, a computer graphics design system based on the IBM Personal Computer. Presentation-quality graphics can be produced as 35mm slides, view graphs, color prints, black-and-white hard copy or video electronic boardroom visuals.

The system incorporates the IBM XT version of the Personal Computer with 256K bytes of random-access memory standard. Graphics capabilities are enhanced by a graphics display processor, which permits two images to be stored in the memory simultaneously. Two monitors are included with the system, a black-and-white monitor and a red-green-blue monitor.

The price of the Autographix 200 is $35,500, with an additional charge of $750 for installation and training.

Autographix, 100 Fifth Ave., Waltham, Mass. 02154.

SPECTRAVIDEO, INC.
SVI-728; Family Pak Plus; 328 Mark II Pro systems

Spectravideo, Inc. has announced two systems using the Microsoft, Inc. MSX hardware and software configuration.

The SVI-728 reportedly is a Digital Research, Inc. CP/M-based machine featuring a Zilog, Inc. Z80A microprocessor. The system is scheduled for release in April.

The company also is marketing its Family Pak Plus and 328 Mark II Pro systems using the SVI-328, full-stroke, CP/M-based computer. The Family Pak Plus is said to include the SVI-328, offering 32K bytes of read-only memory (ROM) and 80K-byte random-access memory (RAM), expandable to 96K bytes of ROM and 144K bytes of RAM.

The 328 Mark II Pro system reportedly features six expansion slots, two disk drives, an 80-col. card, 12-in. monochrome monitor, and an 80 char./sec dot matrix printer and six software programs.

The SVI-728 is expected to have a suggested retail price of $349; the Family Pak Plus and the 328 Mark II Pro are priced at $599 and $1,695, respectively.

Spectravideo, 39 W. 37th St., New York, N.Y. 10018.

STORAGE

PERCOM DATA CORP.
PHD hard disk drives

Percom Data Corp. has announced a generation of high-performance hard disk drives for a variety of personal computers, including IBM's Personal Computer, that are said to support IBM's PC-DOS 2.0. operating system.

The PHD product line reportedly will provide users with speed enhancements and efficient implementation of cache memory. Caching design permits Percom's hard disk drive to work with the host computer so that the most used files are actually stored and processed in memory.

The caching driver will have a suggested retail value of $149.95. A caching driver software upgrade kit will cost $50.

Percom Data, 11220 Pagemill Road, Dallas, Texas 75243.

BUBBLE-TEC DIVISION OF PC/M, INC.
VMI-1 magnetic bubble mass storage memory system

The Bubble-Tec Division of PC/M, Inc. recently announced a magnetic bubble mass storage memory system providing up to 256K bytes of nonvolatile memory for use with microcomputers utilizing the VME-Bus system architecture.

The VMI-1 reportedly includes one or two 1M-bit, bubble memory devices and can be expanded to provide as much as 8M bytes of bubble memory. A controller designed around a Zilog, Inc. Z80 microprocessor reportedly controls bubble device formatting and control and interfaces the bubble memory system to the VME-Bus structure.

The access time of the system reportedly averages under 50 msec, and the effective rate from and to the system is said to exceed 120K bit/sec, the vendor said.

The system is priced at $1,790. A spokesman said a 128K-byte version is also available.

Bubble-Tec, 6500 Sierra Court, Dublin, Calif. 94568.

BOARD-LEVEL DEVICES

OKIOK DATA LTD.
IBM Personal Computer Data Encryption Board

Okiok Data Ltd. has introduced a data encryption board for the IBM Personal Computer, Personal Computer XT and compatible computers.

The encryption/decryption process can be done transparently with disk accesses or communications protocols. Any file may be replaced by an encrypted copy using the data encryption standard algorithm.

An optional secure drive software module automatically encrypts and decrypts data written to a disk as it is read back. This is done transparently and supports all standard IBM disk utilities, Okiok said. The data encryption board requires one short slot on the Personal Computer motherboard and is priced at $400.

Okiok Data Ltd., 3945 St.-Martin Blvd. W., Laval, Quebec, Canada H7T 1B7.

AUXILIARY EQUIPMENT

KEY TRONIC CORP.
Models KB5151J; KB5151

Key Tronic Corp. has announced a full-travel, plug-compatible keyboard said to provide for enhanced operation of IBM's PCjr. In addition, it also unveiled a plug-compatible keyboard for IBM's Personal Computer and Personal Computer XT.

Designed for the IBM PCjr, the Model KB5151J reportedly is a deluxe version of Key Tronic's previous KB5150 keyboard, which has a separate cursor pad and function keys placed across the top. The unit comes standard with the cable connection so that it can be used in any environment. It costs $255.

Designed for the IBM Personal Computer series, the Model KB5151 is said to be a low-profile unit featuring separate cursor command keys, a separate numeric pad, top-row function keys with removable template and a pencil-and-book holder ridge.

In addition, the unit offers familiar typewriter key placement, LED status indicators on all lock keys and incorporates solid-state capacitive switches, microprocessor electronics and positive tactile feedback. The KB5151 has a suggested list price of $255.

Key Tronic Corp., P.O. Box 14687, Spokane, Wash. 99214.

AMDEK CORP.
Color IV

Amdek Corp. has introduced Color IV, a color monitor compatible with the IBM Personal Computer and the Digital Equipment Corp. Rainbow microcomputer.

Color IV is available in two versions, with either red-green-blue analog or digital input. It will display the 16 colors of the IBM Personal Computer or the RS170A, red-green-blue signal of the DEC Rainbow.

According to the vendor, the monitor has 720 by 420 line resolution with a .31mm dot pitch CRT. It has a character display capability of 96 by 24. The cabinetry of the monitor was developed for either industrial environments or commercial applications, a company spokesman said.

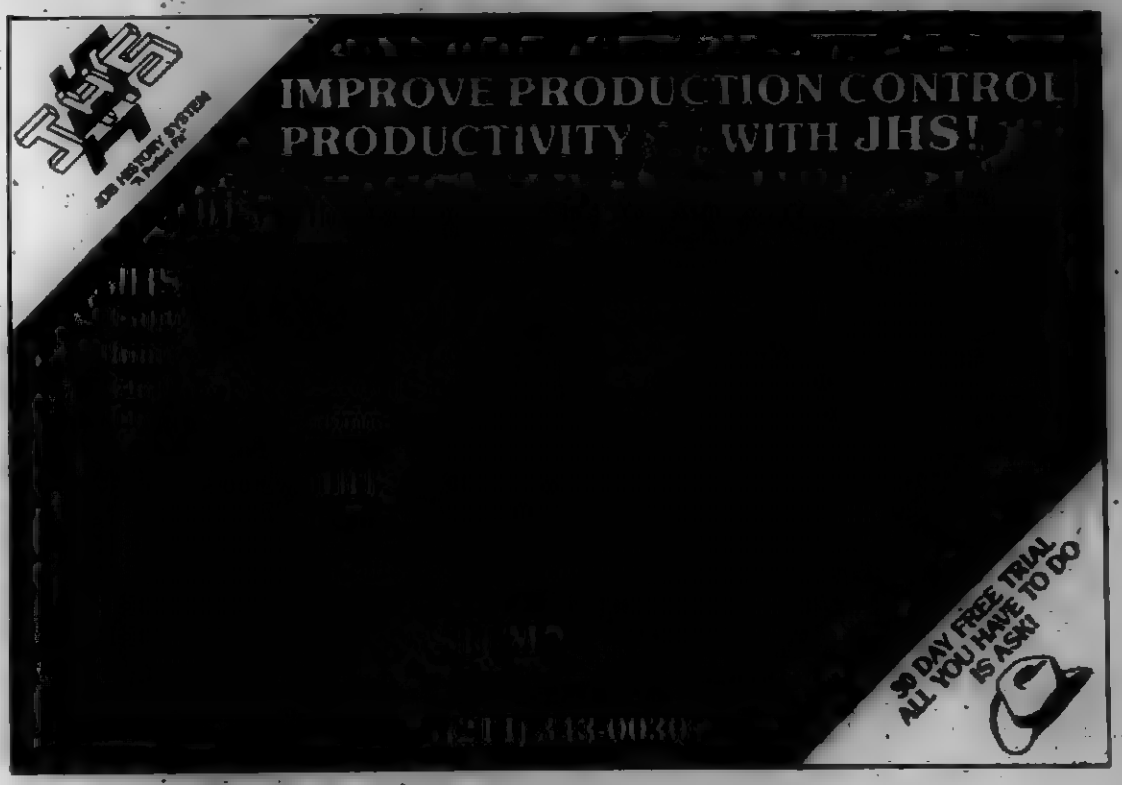
The suggested retail price of the Color IV is $995.

Amdek, 2201 Lively Blvd., Elk Grove Village, Ill. 60007.

SIERRACIN/POWER SYSTEMS, INC.
SC1142; SC1143 power-switching supplies

Sierracin/Power Systems, Inc. has announced two power-switching supplies designed for microcomputer applications, the SC1142 and the

Continued on page 78



MICROCOMPUTERS

Continued from page 76

SC1143.

The SC1142 features 62W of power, sufficient for two floppy disk drives; the SC1143 supplies 100W of power, enough for a floppy and a hard disk drive, according to the vendor. The power supplies feature dual input of 90 to 132 and 180 to 248 Vac and 47Hz to 63Hz. They fit in a 6-in. by 12-in. by 2¼-in. chassis.

The SC1142 costs $95; the SC1143 is priced at $95.

Sierracin/Power Systems, 20500 Plummer St., Chatsworth, Calif. 91311.

PC SOFTWARE INTEREST GROUP
IBM programs book

PC Software Interest Group has introduced a book that lists hundreds of public-domain and user-supported programs for the IBM Personal Computer.

Programs cover a wide range of topics, from financial analysis to communications to games. Copies of the book are available for $2.95 plus $1 shipping.

PC Software Interest Group, Suite 150R, 1556 Halford Ave., Santa Clara, Calif. 95051.

BSR (USA) LTD.
AM Computer Care Line

BSR (USA) Ltd. has imported the AM Computer Care Line from Denmark. The products are said to help protect hardware and software from harm caused by dust, static and smoke particles.

The Diskette Safe Pack is a protective mailing box designed to protect 5¼-in. and 8-in. diskettes from electrical and physical damage. It costs $5.

Also offered is the CCC-2 Computer Cassette Cleaner, with cleaning cassette, brush and 20 ml of cleaning fluid, and a Computer Screen Cleaner Kit with 20 ml of cleaning fluid and cleaning cloth — both for $9 each. The CKC-1 Computer Keyboard Cleaner, consisting of 50 chemically treated tissues, costs $12.

BSR (USA), Rt. 303, Blauvelt, N.Y. 10913.

HOFFMAN COMPUTER PRODUCTS
Copy protection services

Hoffman Computer Products, a diskette duplicating firm, has introduced copy protection services for the IBM Personal Computer and Commodore Business Systems microcomputers.

According to the vendor, the service is in response to the problem of software piracy (two to 10 illegal copies of software are made for every legal copy). Services are currently available for copying disks in the 5¼-in. format, single- or double-sided. The basic charge for copying in the 5¼-in. format (in quantity) is less than 30 cents per diskette per side.

Hoffman Computer Products, 1720 Flower Ave., Duarte, Calif. 91010.

MICRO SOFTWARE

BOS NATIONAL, INC.
Mboe/5; Microcobol adaptions

Bos National, Inc. has announced that the Mboe/5 multiuser operating system and Microcobol have been adapted for the IBM Personal Computer and the Personal Computer XT, giving users the ability to add two CRT terminals and to achieve time-sharing capabilities.

Any program or system written in Bos/Microcobol will run on the Personal Computer or Personal Computer XT without recompilation or relinking, according to a spokesman for the vendor.

Porting of such programs and data files to the Personal Computer and XT from other Bos-supported computers can be done by direct transfer of media on 5¼-in. diskettes or using the remote communications feature of Mboe/5 via the serial port of the XT.

The Mboe/5 with runtime Microcobol sells for $1,050.

Bos National, 2560 Royal Lane, Dallas, Texas 75229.

STONEWARE, INC.
Advanced DB Master

Stoneware, Inc. has announced an enhanced version of the DB Master, a computerized filing system for the IBM Personal Computer, Personal Computer XT and compatible machines.

No programming is required to use Advanced DB Master, the vendor said. Advanced DB Master allows the user to store, search, restructure and calculate information and print out customized reports. The user determines how the information is organized.

Features include keystroke macros, text editing and merging, computed fields, user-defined reports, dynamic value tables, array searches, audit trail, screen forms, browse mode, required fields, error prevention, various field types, print buffer and data exchange with other programs and computers.

The system is priced at $595.

Stoneware, 50 Belvedere St., San Rafael, Calif. 94901.

NELSON DATA RESOURCES, INC.
Lazycoder II

Nelson Data Resources, Inc. has announced the second release of Lazycoder program development aids for the IBM Personal Computer and Personal Computer XT.

Hannover Messe '84

Continued from page 76

Lazycoder II was designed for the professional programmer. It designs and edits screens for the generation of three types of file maintenance programs — sequential, random and indexed, the vendor said.

Screens may be designed using the top 23 lines of the screen as an electronic blackboard. Screen design has functions such as draw line, frame screen and input field definitions. A high-speed index support module called Fabs/PC gives the Personal Computer the capability of supporting indexed files. Generated programs may be modified to support multiple data screens, the vendor said.

The retail price of $450 includes Fabs/PC, an assembly language module that requires rapid access to very large data files, Fabs/PC sample programs, manuals for Lazycoder-Screen II and Fabs/PC.

Nelson Data Resources, P.O. Box 24247, Omaha, Neb. 68124.

SMC SOFTWARE SYSTEMS
Thoroughbred Operating System

SMC Software Systems, a division of Science Management Corp., has introduced a multiuser, multiprocessing operating system for the IBM Personal Computer XT.

According to the vendor, the Thoroughbred/OS will support three terminals and one printer and allows for simultaneous processing of multiple applications.

The product was designed to turn a single-user Personal Computer XT into a two-user system by adding one terminal and upgrading to 256K bytes of memory.

For a three-user system, a third terminal plus an IBM asynchronous communications adapter are required.

The product offers Personal Computer XT users a line of business and productivity software that includes Thoroughbred Idol, a data base manager, seven accounting modules and full-color business graphics.

The Thoroughbred/OS can be installed on a partitioned hard disk that is shared with IBM's PC-DOS so that users are able to store both the Thoroughbred software and the PC-DOS software on the same hard disk.

The product retails for $795, the vendor said.

SMC Software Systems, 1011 Rt. 22, Bridgewater, N.J. 08807.

UNIPRESS SOFTWARE, INC.
Apple Lisa Unix enhancements; Unify

Unipress Software, Inc. has announced enhancements to its Unix operating system for Apple Computer, Inc.'s Lisa microcomputer.

The Apple Lisa Unix, a full Bell Laboratories System III with enhancements, includes support for Corvus Systems, Inc. 10M-, 20M- and 40M-byte disk drives, as well as the 5M-byte Apple Profile hard disk drive.

According to the vendor, the disks are available from Unipress. The full System III, multiuser Apple Lisa Unix, including C development tools and text processing tools, is priced at $1,495 and is available immediately, the vendor said.

The vendor's Unify data base system is also available for $1,400.

Unify includes a query language, report writer and interactive data entry and validation, according to a spokesman for the vendor.

Unipress Software, 1164 Raritan Ave., Highland Park, N.J. 08904.

BRODERBUND SOFTWARE, INC.
Bank Street Writer

Broderbund Software, Inc. has introduced the Bank Street Writer for the Commodore Business Machines, Inc. Commodore 64 computer.

Features of the program include universal search and replace, block move and unmove, automatic centering and indent, inverse highlighting of text, word wrap, disk storage and retrieve functions with password protection, according to a spokesman for the vendor.

Bank Street Writer comes with a tutorial on a disk that teaches basic principles of word processing. A reference manual and a backup disk are provided free of charge.

The program is available now in disk format for $69.95, the spokesman said.

Broderbund Software, 17 Paul Drive, San Rafael, Calif. 94903.

CONCENTRIC DATA SYSTEMS, INC.
Concentric Information Processor

Concentric Data Systems, Inc. recently announced a data base/information management and report writing program for the IBM Personal Computer that reportedly requires no command language and can be integrated with Visicorp's Visicalc and Lotus Development Corp.'s Lotus 1-2-3.

The Concentric Information Processor allows users to see the results of report writing directly on the screen as they will appear in final reports, according to a company spokesman. A horizontal scrolling capability reportedly allows 132-col. reports to be visually defined using an 80-col. display.

The package is priced at $395 and will be available this month.

Concentric Data Systems, 18 Lyman St., Westboro, Mass. 01581.

MARK OF THE UNICORN, INC.
PC/Intercomm

PC/Intercomm, a data communications package developed by Mark of the Unicorn, Inc., is now available for use on the Zenith Data Systems Z100 personal computer. The package is

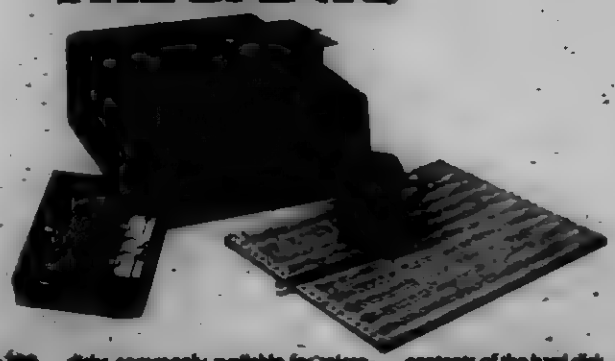
1000 FLOPPY DISKS

VS.
THE BANK.



Savings you can take to the bank: 200 MB only $2,195. CORVUS is proud to introduce the BANK.

It's the most dramatic breakthrough in low cost, high capacity mass memory systems since CORVUS introduced the Winchester disk for microcomputers in 1979.

The BANK's removable tape cartridges hold up to 200 megabytes of information. That's equal to 1000 double density floppies or 10 times the capacity of the largest hard disks commonly available for microcomputers. You can use the BANK to complement a Winchester disk. It has 19 times the capacity.

And the BANK's cartridges are removable for unlimited capacity and storage.

On-line archival back-up you can bank on. You can use the BANK as a random access archival device. If your Winchester disk fails, you can restore selected volumes without having to restore the entire contents of the hard disk.

The BANK is the perfect solution to your back-up storage problems as a shared storage device on OMNINET™ — the leading Local Area Network for microcomputers.

Call CORVUS for the name of the dealer nearest you. We're sure you'll smile ... all the way to the bank.

For more information contact: CORVUS SYSTEMS, 2100 Corvus Drive, San Jose, CA 95124, 1-800-4-CORVUS.

CORVUS
THE NETWORKING COMPANY

The BANK connects to various brands of computers using OMNINET Local Area Network TRANSPORTER™ interface cards. The BANK is currently available for the CORVUS CONCEPT™ and the IBM PC™
CORVUS, THE NETWORKING COMPANY, the BANK, OMNINET, CORVUS CONCEPT and TRANSPORTER are trademarks of CORVUS SYSTEMS, INC. IBM and IBM PC are trademarks of International Business Machines.

MICROCOMPUTERS

Continued from page 77

said to allow the Z100 to emulate Digital Equipment Corp.'s VT100 CRT terminal.

With PC/Intercomm, Z100 users can communicate with DEC host minicomputers and run full screen applications programs, the company said.

The package communicates at speeds up to 9,600 bit/sec.

PC/Intercomm has 30 programmable function keys and operates under 128K bytes of memory with one disk drive and an RS-232 Asci communications port.

Priced at $99, the product is available at Zenith dealers.

Mark of the Unicorn, 222 Third St., Cambridge, Mass. 02142.

RYAN-MCFARLAND CORP.
RM/Cobol; RM/Fortran compilers

Ryan-McFarland Corp. has announced its RM/Cobol and RM/Fortran compilers for businesses using the Apple Computer, Inc. Lisa microcomputer.

Both languages are configured to run under the Microsoft, Inc. Xenix and Unisoft System Corp. Unipius operating systems.

The RM/Cobol compiler is available now, while the RM/Fortran is scheduled to be available by the end of January.

The suggested retail price for each compiler is $1,250, the vendor said.

Ryan-McFarland, 609 Deep Valley Drive, Rolling Hills Estates, Calif. 90274.

DECISION STRATEGIES, INC.
Garden State DRG Support System

Decision Strategies, Inc. has announced a set of microcomputer-based software modules designed to help hospitals implement federal Medicare reimbursement programs.

The Garden State DRG Support System is designed to operate on an IBM Personal Computer or Personal Computer XT as a standalone system or as a support system for other computer systems or services. Features reportedly include the ability to integrate with other systems on an upload or download basis and the ability to review patient records while the patient is still in the hospital.

Total hardware and software cost for the system, available now, ranges from $15,000 to $30,000.

Decision Strategies, 174 Forbes Road, Braintree, Mass. 02184.

SOFTWARE TECHNOLOGY FOR COMPUTERS, INC.
Creator

Software Technology for Computers, Inc. has announced a software package designed to enable personal computer users to tailor a variety of applications to their particular needs.

The Creator reportedly runs on the IBM Personal Computer; the Apple Computer, Inc. Apple II and IIe computers; the Compaq Computer Corp. Compaq Portable Computer; and other IBM-compatibles.

According to the company, users can design their own programs by selecting one of 10 ready-to-customize work areas and then answering English-language questions that appear in a step-by-step process on the screen. The Creator is also said to offer additional English-language routines outside of those 10 areas.

Among the applications included are word processing, data base management, bar graphs, mailing list and invoicing.

The package is priced at $300 for the IBM Personal Computer and Compaq and costs $250 for the Apple II and IIe.

Software Technology for Computers, 153 California St., Newton, Mass. 02158.

VAN L. ENTERPRISES
Format 1-2-3

Van L. Enterprises has introduced Format 1-2-3, a general-purpose utility for the IBM Personal Computer that converts reports and data files into a format compatible with the Lotus 1-2-3 spreadsheet program from Lotus Development Corp.

Format 1-2-3 is said to convert any alphanumeric text file into a form that is recognized and directly loadable by Lotus 1-2-3. According to the company, the utility program can convert

Continued on page 79

MICROCOMPUTERS

Continued from page 78

entire reports; conversely, the user can select specific variables or columns to be converted.

Format 1-2-3 requires a Personal Computer with 64K bytes of memory, one disk drive and the PC-DOS 2.0 operating system.

It is available for $100, according to a spokesman for the vendor.

Van L. Enterprises, Box 849, Marina, Calif. 93933.

MICROGRAFX
PC-Draw Version 1.3

Micrografx recently announced PC-Draw Version 1.3 to provide users of its IBM Personal Computer graphics package with color support, presentation graphics, improved user prompts, improved windowing and color overlay capability.

The company also announced support for the Hewlett-Packard Co. HP 7470A plotter.

The enhanced version of PC-Draw also reportedly provides improved user prompts for parameter entry, improved symbol scaling and an improved alternate text with characters said to utilize 50% less string space than in the previous version.

Version 1.3 is available to existing users for $50, a spokesman for the vendor said. A module for support of the HP-7470A plotter is available for $50, along with a plotter driver for $50, the spokesman said.

Micrografx, Suite 708, 1701 N. Greenville, Richardson, Texas 75081.

NEC INFORMATION SYSTEMS, INC.
Graphplan

NEC Information Systems, Inc. recently announced that users of its APC microcomputers may now obtain Chang Laboratories, Inc.'s Graphplan package, which runs under Digital Research, Inc.'s CP/M 86 operating system and includes an electronic spreadsheet and business graphics.

The package is reportedly compatible with Chang's Microplan package and allows users to edit data, perform mathematical and statistical computations, do "what-if" analysis and perform numerical ranking of data and alphabetical sorting of rows and columns.

Graphplan will operate on both color and monochrome display terminals and is available for $295.

NEC, 5 Militia Drive, Lexington, Mass. 02173.

RADIO SHACK
Color Disk Graphics; Pocket Organizer

Radio Shack recently announced software packages for its TRS-80 Color Computer and the TRS-80 Pocket Computer 2.

The Color Disk Graphics package reportedly allows plotting of color charts and graphs on the Color Computer. The package requires either 16K-byte or 32K-byte versions of the Color Computer with extended color Basic, a color television, disk drive and the vendor's Disk Controller Pack.

Pocket Organizer is a personal organizing aid for the Pocket Computer 2 that reportedly stores a list or queue of things to do. Using the package, lists of appointments, activities or tasks may be reviewed, edited, deleted, printed and saved on tape.

Color Disk Graphics is priced at $49.95, and Pocket Organizer is priced at $19.95.

Radio Shack, 1800 One Tandy Center, Fort Worth, Texas 76102.

TELEVIDEO'S 970: GET IN ON THE ANSI BOOM.

The TeleVideo 970 Terminal. The computer professionals' most powerful ticket to the emergence of the ANSI standard.

The overwhelming acceptance of ANSI X3.64 has revolutionized the future of trans-system communication and software compatibility. Now TeleVideo steps forward with the ultimate complement to that revolution. The ANSI equipped TeleVideo 970 terminal.

The 970 takes the lead in utilizing the advantages of the ANSI code structure. It's 32 non-volatile function keys literally automate ANSI code command entry. Other features include VT-100 compatibility, block mode operation, block graphics and attributes and a totally reconfigurable keyboard. An RS232 printer port with built-in buffer is standard. All this is packaged in the 970's unique vertical convection cooling tower. It protects sensitive circuitry without the noise of conventional fan-cooled construction.

In terms of operator comfort the 970 has no equal. The keyboard with ten-key accounting pad is ergonomically designed with a naturally contoured palm rest and sculpted keys. The non-glare 14 inch screen allows maximum readability in either the 80 or 132 column format. And you can display double-high, double-wide characters on the same fatigue-free background we've been applauded for throughout the industry. Screen tilt adjusts at a touch to further fight operator discomfort.

Of course, as with all TeleVideo terminals, 970 service is available nationwide from General Electric Instrumentation and Computer Service Centers.

The 970. A combination of power, ease of use and TeleVideo reliability at a time you need it most. The ANSI boom is here. Get in on it with the TeleVideo 970.

COMPUTER INDUSTRY

FCC edict raises MCI, GTE spirits

INDUSTRY INSIGHT

BILL LABERIS

If nothing else, the Federal Communications Commission's (FCC) reluctant decision this month to scale down access charge increases for AT&T competitors has removed a lot of the uncertainty that had clouded matters for companies like MCI Communications Corp. and GTE's Sprint.

First, it should be noted that the pressure brought to bear on the FCC by Congress, the U.S. Justice Department and others to ease up on access charges of AT&T's competitors was warranted. Why should the MCIs and Sprints pay 75% of the access charges borne by AT&T when they do not have anything approaching 75% equal access to the networks of the local phone companies (nor will they for some time to come)?

Also, AT&T's implied threat, that it would lower long-distance rates only if the FCC maintained its access charge structure, may prove just that, as the company will likely still cut long-distance rates, to meet the competition, if for no other reason. AT&T was undoubtedly happy that the FCC and not Congress will be the final arbiter in the access charge matter, as Congress was leaning toward a rate structure that might have proven unjustifiably harsh on AT&T.

As a result of the revised FCC decision, MCI and its brethren this year will face access charges in the $335 per month per line area — more than the $234 mulled by Congress and far less than the $560 under the FCC's original plan. The difference between what AT&T pays — about $740 — and what its competitors pay will be erased once all long-distance suppliers have true equal access to the local phone companies' networks.

MCI said the savings it realizes via the revised plan will not impact its aggres-

See FCC page 92

HP axes 32-bit supermini plans

By Jeffry Beeler
CW West Coast Bureau

PALO ALTO, Calif. — Hewlett-Packard Co. has dropped its plans to announce a 32-bit supermini that would compete with Digital Equipment Corp.'s VAX-11 series, but it will add a second model to its family of mainstream personal computers this spring.

HP has decided "to skip the interim step" of adding a 32-bit processor to its existing 3000 series of 16-bit minicomputers, a company spokesman disclosed during a Jan. 20 telephone interview. Instead, the firm intends to develop an alternative computer line "based on a 'breakthrough' technology now under development in our labs."

The spokesman declined to reveal any specifics about the experimental technology or to predict when it will become commercially available, although he ruled out the possibility that the successor to HP's 3000 line would be introduced this year.

The source also refused to discuss details of HP's upcoming personal computer announcement other than to say that it will involve new peripherals and an additional processor, which will be "related" to the company's existing Model 150 micro.

HP's recent decision to bypass the 32-bit supermini arena contrasts sharply with the company's earlier statements about its short-term business systems plans. In November 1982, when it introduced its 32-bit, 9000 series engineering workstation, the firm publicly committed itself to developing a commercial version of the same product.

But 14 months later, during a Jan. 18 security analysts' meeting, HP reversed its original position and cited lack of user demand as the main reason behind its unexpected shift in strategy. "The announcement of a 32-bit business computer is apparently of much greater interest to security analysts, who are watching DEC and its VAX systems, than it is to our customers," the spokesman said.

For users of the company's 3000 series business minis, the main systems concerns are preservation of their existing software and HP's ability to periodically enhance the product line's throughput and other performance features, he added. Thus far,

See HP page 92

NCR, Burroughs earnings up

Two of the "bunch" — NCR Corp. and Burroughs Corp. — have reported strong increases in both sales and earnings for 1983, with bottom lines buoyed by especially strong fourth-quarter performances.

NCR reported record profits of $286 million, or $10.55 per share, for the year ended Dec. 31, a 23% increase over the previous year.

The company also announced that it had increased the quarterly dividend from 65 cents per share to 80 cents per share, and the board of directors will ask shareholders at the annual meeting April 18 to approve a 4-for-1 stock split. That split would make 3.2 million shares available for options and other purposes, NCR said.

Fourth-quarter earnings increased by $20.4 million, 22% over the year-ago quarter. Revenues rose by 6% for the year to $3.7 billion and for the quarter by 7% to $1.06 billion, according to the company.

NCR President and Chief Executive Officer Charles E. Exley Jr. said incoming orders were up substantially for the year and the fourth quarter across the company's major product lines. Profits in the last quarter benefited from "effective control of costs, expenses and asset levels."

With the company just entered into its century year, Exley said NCR is beginning 1984 "in the strongest financial position in recent company interest." Liquid assets and internally generated funds will allow the company to finance development programs readily, he added.

Burroughs last week reported that 1983 earnings increased to $197 million or $4.60 per share. The earnings, which included fourth-quarter profits of $81.4 million providing $1.81 per share, jumped from

Industry gets a voice in tax reform debate

By John Gallese
CW Washington Bureau

WASHINGTON, D.C. — Mindful that 1984, an election year, will see much talk about tax reform but very little action, the Ad Hoc Electronics Tax Group has entered the debate with recommendations for a united industry push for more favorable tax treatment, an effort the panel hopes will bear fruit in the coming years.

At a Jan. 18 press conference here, members of the group, which represents 20 leading electronics industry firms, including Control Data Corp., Data General Corp., Digital Equipment Corp., Harris Corp., Hewlett-Packard Co., Honeywell, Inc., IBM, NCR Corp. and Sperry Corp., presented its report to five industry associations [CW, Jan. 23].

Among the recommendations submitted to the associations for consideration and support were:

- A permanent research and development tax credit and extension of the 1981 law that instituted the credit to cover depreciation on R&D equipment.
- Extension of recent, favorable equipment-investment tax incentives to the more short-lived equipment common to high-technology electronics companies.
- More favorable tax treatment for industry foreign income and employee equity participation programs and amended foreign tax-credit provisions.
- A value-added tax as the mechanism for whatever additional revenues Congress decides are necessary to balance the national budget.

Robert Kirkwood, HP director of government affairs and chairman of the ad hoc panel, said he expects the associations may differ in what recommendations, if any, they decide to support. The report was praised by the American Electronics Association, the Computer and Business Equipment Manufacturers Association, the Electronics Industries Association, the Scientific Apparatus Makers Association and the Semiconductor Industry Association.

Kirkwood said the year-long study effort was necessary because the many pieces of legislation to assist high-technology firms are stalled in Congress. He said the industry realized it must develop a consensus on tax reform before these and related proposals come up for serious congressional consideration.

Kirkwood suggested the report could become a blueprint for a candidate's efforts to solicit support from high-technology industries. For instance, he said, if a candidate does not support permanency of the 1981 R&D tax credit, it would be "a telltale sign" that he is not supportive of high technology.

The recommendations are especially suited for the electronics industry, according to Emil Sunley, director of tax analysis for Deloitte Haskins & Sells, which provided economics advice to the ad hoc group. Sunley noted that high-technology firms pay higher taxes than other industries. He cited statistics showing the 1982 effective tax on U.S. income was 26.5% for computer and office equipment firms and 23% for firms in the instrument industry. This compared, he said, to an overall corporate effective tax rate of 16.1%.

In general, Sunley said the electronics industry does not benefit from the "incentive structure" of the current tax code, which he said is aimed at manufacturing firms that are heavily debt-financed, rely on long-lived equipment and concentrate on domestic operations.

Electronics firms, with their need for large sources of capital, large R&D expenditures, quickly obsolete equipment and international scope of operations, are under a disadvantage in current tax law, he said.

NCR from page 81

1982 full-year earnings of $117.6 million and $2.80 per share.

The company reported 1983 revenues of $4.38 billion, up 5% over 1982, while fourth-quarter revenues grew by a record 17% to $1.3 billion compared with the same period a year ago.

Chairman W. Michael Blumenthal said, "The strong order trends are a confirmation that our investments in research and development, service and support, and product quality are being recognized in the marketplace."

Blumenthal cited the B7900 and B4900 mainframes, Memorex 3680 thin-film disks and terminal products as new items that were "well received."

FOR THREE DAYS IN TEXAS WILL TURN

No single computer, personal or otherwise, has so profoundly affected all of business and industry as the IBM Personal Computer.

And now, for three days only, you can see, touch, use and compare the hardware, software, peripherals and compatibles that run on, like or with this revolutionary machine. It's the PC *World Exposition* in Houston, and you are invited to join us.

You'll see hundreds of exhibits from all the product leaders. Both makers and marketers of hardware, software, printers, peripherals, add-ons and services in a giant exhibition and retail selling event. Here's a list of some of the product leaders you'll see:

Macintosh debut seen testing micro rivals

By Robert Batt
CW West Coast Bureau

SAN FRANCISCO — The anticipated long-term success of Apple Computer, Inc.'s newly launched Macintosh personal computer [CW, Jan. 23] has led some industry observers to speculate about the impact on the company's microcomputer rivals, most notably IBM and AT&T.

Mike Murphy, partner in the investment analysis firm of Venture Capital Management, Inc. and coauthor of the California Technology Stock Letter, believes the introduction of the Macintosh will reveal weaknesses in IBM's Personal Computer product line.

"With Apple gearing up for an annual production of 600,000 Macintoshes, the new product will reveal a flat spot in demand for IBM's [Personal Computer], and the shortage of IBM machines will end. This will help dispel the mystique in the marketplace about the [Personal Computer] and will cause headaches for both IBM and IBM look-alike products," he asserted.

Greg Kelsey, investment analyst at Hambrecht & Quist, maintained that the Macintosh, which is expected to add up to 40% more to Apple's current revenues of almost $1 billion, will also give Apple added status among its dealer network.

IBM's increasingly successful attempts to sell the Personal Computer through its direct sales force have left many distributors anxious about their future partnership with Big Blue, he said.

Apple, on the other hand, intends to use its strength in the dealer network to promote its new product offerings, and the company claims the Macintosh will be sold by all 1,500 of its accredited dealers in North America, plus 1,500 dealers overseas.

Industry experts also expect the Macintosh to affect purchasing decisions in medium- and large-scale corporations and slow down the acquisition of IBM Personal Computers.

The data processing manager, Murphy asserted, will want to take a close look at Apple's new product line before buying further quantities of IBM Personal Computers.

Murphy claimed the Macintosh will force IBM to head user complaints that programs are running too slowly on the Personal Computer and will encourage Big Blue to come out with a new version with an upgraded chip — a variant of Intel Corp.'s powerful new 80186 — by the fall of this year.

Murphy predicted that IBM will ask semiconductor manufacturer Intel to design a proprietary chip for the Personal Computer that will put independent software developers in the delicate position of having to choose between supporting IBM microcomputers or go to its competitors such as Apple.

This view was reinforced by Ken Lim, personal computer industry analyst at Dataquest, Inc., a San Jose, Calif.-based market research firm. "IBM is not going to leave the [Personal Computer] architecture as open as it currently is for too much longer," he attested.

According to industry pundits, the other company most likely to be affected by a successful Macintosh drive will be AT&T, owner of the rapidly rising Unix operating system.

Murphy claimed there is a strong possibility that AT&T will be interested in acquiring Macintosh on an OEM basis for the purpose of running Unix on the new machine.

"If AT&T comes out with a multiuser microcomputer system, it makes good technological and business sense for them to sign an OEM agreement with Apple in order to develop a single-user system as well," he suggested.

In the event of such a scenario, Murphy added, personal computer users will be confronted with three different standards — an IBM standard, a Unix-based standard from AT&T and an Apple 32-bit standard.

FEBRUARY, ALL EYES IN TO THE IBM PC.

Plus, we'll present personal computer experts from around the nation in an up-to-the-minute conference program. You'll learn how to choose and how to use the technology and equipment surrounding the PC family of microcomputers. Here's a partial listing of the conference sessions:

Wednesday, February 1, 1984
User Sessions:
The Benefits of the IBM PC for Small Businesses
Financing Options and Tax Advantages Available Add-Ons and Peripherals
Software: What's Available and How to Find It
What Do the Compatibles Have To Offer?
How I Became Compatible With My IBM PC
Medical/Dental Applications for the PC
The PC in the Law Office
PC's and Real Estate
Manufacturing Resource Planning with the PC
Investment Software for the PC
CPA Software: The Bottom Line
Software for Insurance Applications
Distributed Control Software for the PC

Thursday, February 2, 1984
User Sessions:
The Anatomy of the IBM PC
Defining Levels of Compatibility Between Systems
Overview of Compatibles: Desktops and Portables
Word Processing Software
Database Management Software
Business Graphics Software
Analyzing Your Software Requirements
Overview of Major Business Applications Software
Integrated Software Solutions

Friday, February 3, 1984
User Sessions: The PC in the Corporate Environment
Review of Policy and Planning Issues
Implementation Strategies
Use of PC to Mainframe Communications (Includes Security Issues)
Local Networking for the PC

Quite simply, the PC *World Exposition* is the biggest event in Texas for the most important computer in history.
Don't miss it.

FREE ADMISSION to one Conference Session of your choice. Just present this coupon at the Registration Desk any day of the Show, pay the regular $10 exhibits only admission and choose any one Conference Session free of charge. One coupon per person.

The PC World Exposition
Houston
February 1-3, 1984, Astro Hall

PC WORLD EXPOSITION

SAVE $5.00 on Full Exhibit & Conference Admission. Present this coupon at the Registration Desk and pay just $25.00 for a Conference Pass entitling you to attend all Conference Sessions and three days of exhibits. One person per coupon.

IT'S WHAT THE WORLD IS COMING TO.

The PC *World Exposition* is produced by Mitch Hall Associates in cooperation with CW Communications, Inc., publishers of PC World, MICRO MARKETWORLD, InfoWorld, and Computerworld.

Three-day admission to all exhibits and conference sessions is $30.00. Admission to the exhibits only for three days is $10.00. Show hours are from 10:00 AM to 5:00 PM Wednesday and Thursday, February 1 and 2, and from 10:00 AM to 3:30 PM on Friday, February 3. Conference sessions run from 8:30 – 10:30 AM and 2:30 – 5:30 PM on all three days.
For attendee and conference information, call CW Communications at 1-800-225-4698.
For information on exhibiting, call Mitch Hall Associates at 1-617-329-7400.

Big Eight firm buys Macintosh

NEW YORK — Peat Marwick, the international accounting firm, has bought 2,500 Apple Computer, Inc. Macintosh microcomputers introduced just last week.

The computers and peripheral equipment will cost Peat Marwick $7.5 million and reportedly will be used with the accounting firm's proprietary software — Systems Evaluation Approach Computerized Audit Supports (Seacas) — beginning after the April delivery of the micros.

Peat Marwick partner in charge of auditing, John D. Collins, said the Macintosh could "dramatically reduce" the projected five-year estimate for realization of Seacas' full potential. The Macintoshes will be used by Peat Marwick's 7,000 auditors for communications, analysis and modeling.

IT'S HERE.

The local area network solution from AT&T: DATAKIT VCS.

Now dissimilar computers and terminals can exchange information with low delay and high reliability. With the WESTERN ELECTRIC® DATAKIT™ Virtual Circuit Switch (VCS) from AT&T.

DATAKIT VCS is based on a "kit" of compatible hardware modules that can help create a highly efficient local area network. Then easily expand to link local area networks into wide area networks.

Part of an integrated family of data networking products designed to enhance your data communications capabilities, DATAKIT VCS will improve productivity and cut costs by eliminating the need for special interfaces.

AT&T

Its leading-edge modular architecture, developed and proven reliable at AT&T Bell Laboratories, offers unparalleled flexibility for future growth. Within AT&T, DATAKIT VCS is already serving business needs. There are 25 DATAKIT VCS hubs connecting 600 terminals and 50 host computers. A network that will triple in size this year to service 11 locations in four states.

DATAKIT VCS: the local area network solution from AT&T. It could be working for you right now.

Group to advise Reagan on industrial policy

By John Gantz
CW Washington Bureau

WASHINGTON, D.C. — A primarily Democratic study group of labor, industry and former government leaders this month recommended a coalition of their three sectors to advise the president on industrial policy matters.

The Industry Policy Study Group worked for a year to develop ways to defuse what it sees as a growing adversarial relationship between business and labor as the country moves away from reliance on traditional manufacturing and toward a more service-oriented, high-technology economy.

Chief among its recommendations is an Industrial Development Board, representing government, business and labor, to advise the president and develop "cooperative strategies to promote industrial growth." The board would allow consultation with industry and labor groups and make sure the government does not work against private sector efforts, the study group said.

The board would be supported by an Industrial Finance Administration, initially controlling $5 billion, that would provide loans, guarantees and other support on a 50:50 basis for private programs to advance U.S. industrial competitiveness. The finance group would implement the president's program and not act as an independent financial organization.

R&D urged

In addition, the panel called for an expanded commitment to technological research and development. "One of the first subjects on the board's agenda should be to consider expanding federal assistance for research and development," possibly through a new, separate agency, "with greater attention to manufacturing processes and commercial applications," the study group said.

The group said U.S. industry has developed a strong "knowledge and research capacity" but has in some cases underinvested in development of marketable products and processes. The U.S. may also want, as other countries have decided, to increase "support for and coordination of industrial R&D as a central element of programs designed to promote particular high-technology industries," the panel's report said.

The panel was put together by the Center for National Policy, a research organization chaired by former Secretary of State Cyrus Vance, which is made up primarily of prominent Democrats. The panel included W. Michael Blumenthal, chairman, Burroughs Corp.; Morton H. Meyerson, president, Electronic Data Systems Corp.; Senators Bill Bradley (D-N.J.) and Edward M. Kennedy (D-Mass.); Glenn Watts, president, Communications Workers of America; and other leaders.

At a press conference this month, Irving S. Shapiro, former chairman of E. I. du Pont de Nemours and Co., said the traditional adversarial relationship between major economic sectors in this country is impeding industrial development in the U.S., particularly where this country competes with foreign nations that have strong government-supported industrial policy mechanisms.

But, he said, "We offer no industrial policies today." Rather, he said, the panel was recommending a process to facilitate a sensible and cooperative approach to solving problems of trade, business development and employment.

Lane Kirkland, president of the AFL-CIO, said organized labor has a large stake in the development of U.S. industrial policy because labor pension funds, now representing approximately $700 billion to $800 billion, constitute the largest and most rapidly growing source of capital formation in this country.

Workers should be able to ensure that these funds are used for "constructive and productive" uses that will make this country more competitive internationally, and not spent primarily to finance corporate mergers and other purposes, which, he said, "do not enhance the domestic economy or the employment prospects of working people."

The panel's report comes as Democrats and Republicans have begun lining up their respective industrial policies as the campaigns for the upcoming general election go full force. Both parties have recommendations for cooperative development of industrial policies. However, the Republicans have steadfastly refused to consider any government financial agency to implement industrial policy.

Boeing Computer to enter net services mart

NEW YORK — After withstanding a year of 7% growth while the rest of the computer industry boomed, Boeing Computer Services Co. (BCS) has decided to expand business beyond its original time-sharing base. At a press conference here earlier this month, Robert L. Dryden, BCS president, said the company is entering the commercial information networking services market.

The $800 million Bellevue, Wash.-based unit of the Boeing Co. thus becomes the second time-sharing firm this year to announce a new business direction as a vehicle to expand without depending so heavily on remote computing, a slice of the industry which stagnated last year. Earlier this month, Comshare, Inc., an Ann Arbor, Mich.-based time-sharing company, trumpeted a "complementary marketing pact" with IBM on its System W decision support system software (CW, Jan. 9).

Time-sharing firms "will fail unless they meet the challenges of the changing marketplace," Dryden said in prepared remarks delivered to reporters and analysts here. The new moves, he said, were designed to put the company back on a faster, 20%-plus growth track.

In a series of announcements, Dryden said BCS will this year:

- Begin to offer end-to-end networking capabilities for customers that already have data processing equipment installed. The Boeing commercial network will provide host-to-host and terminal-to-host communications no matter what the brand name on the host computer or interactive terminals, Dryden said.
- Initiate sales of its Systems Network Architecture (SNA) services to the merchant market. First-time SNA users may buy into Boeing's network, while users with an SNA network of their own may connect up to Boeing's in order to gain access to the firm's remote computing services.
- Begin to deliver remote computing services to large-scale data centers on a fixed-price and fixed-resource basis. However, John Spencer, marketing director, said BCS had yet to settle on a fixed-price schedule.
- Begin consulting with companies in search of an "integrated solution to their office information system problems," Dryden said, adding that Boeing would guide its consulting clients "without allegiance to a particular hardware product." The new services include requirement definition, systems analysis, design, integration and implementation.

Dryden also announced the formation of a software and education products group. The marketing organization will peddle Boeing-developed software used in office integration and information centers and for manufacturing and engineering as well as productivity tools for DP workers and education, he said.

Capping his announcements, Dryden told reporters that BCS had captured an $18.6 million contract to build an X.25 communications net for the commonwealth of Pennsylvania.

TIME
Your Most Precious Resource

In any business, time is money! This is especially true when dealing with Data Communication Networks where system performance and RESPONSE TIME is critical to the user.

Degradation of system performance (responsiveness) is inevitable as customer work loads increase. Installing faster, more sophisticated hardware is a popular but temporary solution. It is only a matter of time until the problem reappears.

Questronics offers a solution through statistical performance analysis of your system. Over seventy-five categories of line utilization and response time information can be generated in eleven different reports (hard copy and/or data based).

Questronics model CPA/7 is setting the standard in the industry by providing vital performance statistics in the areas of:

- User/System Response Time
- Line Utilization
- Character Transmission Counts
- Transmission Errors
- Host Resident Time
- Network Transmission Time
- Polling Counts
- Poll List Wrap Time
- Histograms
- Alarm Conditions

Utilizing this information, DataCom managers can then make the crucial decisions necessary to fine tune and balance the network. Each line may also be further refined to greater efficiency, enabling planning and projection for new growth.

Call Questronics and discuss your situation. We'll give you straight answers.

Apple reports 75% profits drop

CUPERTINO, Calif. — On the eve of its big Macintosh announcement last Monday, Apple Computer, Inc. announced quarterly financial results that showed a nose dive in profits despite a 48% gain in sales.

As expected, profits dropped 76% to $5.6 million, or 10 cents per share, compared with $23.5 million, or 40 cents per share, the same period a year ago. The profit line included $2.5 million gained from the settlement of a patent infringement suit brought against Franklin Computer Corp., in which Franklin also agreed not to infringe on Apple's copyrights.

Sales in the quarter swelled to $316 million compared with $214 million the first quarter a year ago. The company also closed the quarter with nearly $188 million in cash.

Most apparent from the results were the increases in research and development (78%), marketing (89%) and cost of sales (85%), each of which grew twice as fast as the growth in sales volume. Stepped-up spending in these areas were required to meet the market challenges and increasing competition in the small systems area, the company had said previously.

John Sculley, president and chief executive officer, said the company experienced record sales of 100,000 units of its Apple IIe, which at the same time suffered from downward price pressure. Profits continued to be adversely affected by "significant increases in . . . expenses and decisions related to our product strategy and organization consolidation," Sculley said.

COMPUTER INDUSTRY

Prime's earnings dip; DEC's rise

Prime Computer, Inc. announced last week that its 1983 profits dropped more than 27% from the year-earlier figures, while the leading minicomputer vendor, Digital Equipment Corp., as expected, reported second-quarter earnings were up 32%, a vast improvement over its disappointing first-quarter losses.

Joe M. Henson, president and chief executive officer of Prime, said his company in the fourth quarter ended Dec. 31 showed "substantial progress from the third quarter in terms of revenue growth, profitability and management of expenses."

Fourth-quarter profits, however, lagged behind year-earlier reports by more than $12.1 million. For the year, the company showed a profit of $32.5 million, or 68 cents per share, compared to fiscal 1982 profits of $44.9 million, or 90 cents per share.

Revenues at Prime for the fourth quarter of 1983 and the entire year were substantially ahead of the previous year's revenues. For the quarter, revenues increased $24.5 million to $142.8 million; for the year, revenues grew almost $80 million to $516 million. Henson cited those revenue figures and accelerating orders as evidence the company is positioned "to benefit from an improved economy."

DEC, following its preliminary report a week earlier [CW, Jan. 23], reported profits for the second quarter ended Dec. 31 were up $30.5 million over year-earlier figures to $80.4 million, or $1.41 per share, with revenues increasing 40% over the same period from $1.01 billion to $1.4 billion. Profits for the first six months of the current fiscal year still lagged $21 million behind the first six months of the previous year as a result of the poor first quarter.

The company said it experienced a sharp increase in shipments and orders for personal computers, as well as strong demand for its VAX-11/730, VAX-11/750, Micro PDP-11 computers and office products.

Leasing firm targets SNA

RALEIGH, N.C. — SNA-COM Associates, Inc. is a newly formed leasing and consulting company specializing in products that operate under IBM's Systems Network Architecture (SNA). The founder and president, David R. McCormick, spent 32 years with IBM before starting SNA-COM Associates.

The company will focus on communication controllers (3705, 3725), clustered controllers (3274, 3600, 4700, 8100), terminals (3178, 329X, 360X, 470X), workstations, Personal Computers, Displaywriters, modems and protocol converters.

It will also offer consulting for network growth in non-SNA protocols, migration aids and voice/data local-area network relationships. Technical assistance will be available for backup, reconfiguration and recovery.

SNA-COM, 1001 Navaho Drive, Raleigh, N.C. 27609.

Can you print 300 pages of data at your Remote site...In 5 minutes?

Yes, Paradyne's NEW 8360 Remote Page Printer Prints as fast as a Page a Second. Paradyne introduces high speed, non-impact remote printing — from one location to any other — at speeds up to 60 pages a minute, depending on line speed and data density.

No Host Remote Teleprocessing Software is Required. Communications requirements are handled through PIXNET®, Paradyne's communication system, and the page printer will operate without any changes to your existing applications programs.

With the 8360 your remote operators have the same functional capabilities as the data center operator. And the 8360 has the same capabilities as the system printer in your computer room.

Uses Standard 8½" x 11" copy paper.

Compact in Size, Highly Reliable and Easy to Use. The 8360 is easy to install and it runs cool — all day long. You'll have a high quality printer designed to blend into your office environment with an operation that's so quiet your operator may have to check to see if it's finished printing.

A Price Breakthrough. Now, Paradyne offers your remotely located offices and plants the convenience of high quality, high speed printing...at a price that's a breakthrough in the industry. Call 1-800-482-3333 and we'll tell you why. Plus, we'll give you the location of the Paradyne sales office nearest to you.

Senate export bill debate renews controversy

By John Gantz
CW Washington Bureau

WASHINGTON, D.C. — The 98th Congress returned for its second session last week expecting renewed debate over high-technology export controls, a controversial topic that has heated up dramatically in the two months since Congress adjourned.

Before Congress adjourned last year, the House had passed an updated version of the Export Administration Act, which governs export licensing. The House bill was fairly moderate and had been endorsed by industry. But the Senate had not finished action on its version of the legislation, and export licensing is currently handled under an interim extension of the older export control law.

Certain factions within the Reagan administration, particularly in the Treasury and Defense Departments, have been pushing for stricter licensing procedures. It was expected that this battle, whose outcome is still unsure, would be fought during the upcoming Senate deliberations. But the outlook for Senate adoption of the moderate approach has dimmed considerably.

The recent highly publicized seizure of American-made computers illegally destined for the Soviet Union [CW, Nov. 21, 28] has strengthened the position of export control hardliners. The Commerce Department is now proposing tightening standards for obtaining a single export license for multiple sales of certain high-technology products.

The Commerce proposals have been in the works for about a year, but coming just as Congress starts its final debate on the export bill, they have provoked strong reaction from high-technology industries.

Computer and Business Equipment Manufacturers Association (Cbema) President Vico E. Henriques, for example, issued a statement decrying the administration's effort to link the computer equipment seizure with the export bill renewal. "The administration argument is that the current licensing procedure is too lax, allowing high-tech companies to ship sensitive equipment to our enemies," he said.

Henriques continued: "The argument that the [Export Administration Act] needs more review layers is incorrect. So is the implication that the high-tech industry is trying to weaken safeguards against shipments of critical goods and technologies to America's enemies."

He argued that stricter license review practices "would not necessarily have prevented the attempted diversion" of computer equipment to the Soviet Union. "U.S. industry and government can't afford to waste time, money and manpower in a meaningless exercise in paper-shuffling. Government needs to devote its resources to enforcement so that those who try to divert high-tech exports to our enemies are caught and prosecuted," Henriques said.

Airline to ship DP equipment

NEW YORK — A service specializing in air transport of sensitive computer equipment has been announced by Sureway Air Traffic Corp.

Computer Express was designed to meet the specialized transport needs of hardware and software manufacturers and other users who move equipment sensitive to jarring, temperature and changes in humidity and magnetic field.

Randy Catlin, vice-president of Sureway, said, "In the 20 years we've been in business, we've never had as many requests as in the last two years for personalized, individually tailored transport in the computer industry."

Sureway, 36-14 33rd St., Long Island City, New York 11106.

Inman to chair ATP group

WASHINGTON, D.C. — Adm. Bobby Inman (USN Ret.) last week was named chairman of the Alliance for Telephone Progress (ATP), a group of companies and trade associations recently formed to amend telephone access charge legislation now pending in the U.S. Senate [CW, Jan. 16].

Inman, deputy director of the Central Intelligence Agency from 1981 to 1982 and director of the National Security Agency from 1977 to 1981, is chairman and chief executive officer of Microelectronics and Computer Technology Corp. in Austin, Texas.

Members of ATP reportedly represent more than one-half of all business phone usage in the U.S.

Study views software mart
Microsoft seen top independent

DALLAS — Microsoft, Inc. has begun 1984 as the largest independent personal computer software publisher. And the three largest publishers of software for office personal computers are also the leading personal computer manufacturers — IBM, Radio Shack and Apple Computer, Inc. — according to the recently released "Office Personal Computer Software Market Report" by Future Computing, Inc.

IBM and Radio Shack each sold between $110 million and $130 million in software for office personal computers in 1983, while Apple totaled more than $65 million. Meanwhile, Microsoft jumped ahead of Visicorp in independent vendor sales, posting software sales of more than $65 million, while Visicorp recorded between $50 million and $55 million in sales last year.

The 300-page report estimated the total value of software sold for office personal computers will climb from the 1983 level of $1.4 billion to $6.7 billion by 1988.

Top-selling spreadsheet

The report also asserted that Lotus Development Corp., a relative newcomer, sold between $45 million and $50 million of its 1-2-3 spreadsheet software, with sales exceeding 20,000 units per month, making it the top-selling spreadsheet program. units per month and sold over 600,000 copies in 1983, making it the most widely used spreadsheet program.

In addition, the report said Micropro International Corp.'s Wordstar word processing package is selling at more than 15,000 units per month, slightly ahead of Apple's Apple Writer. Future Computing estimated that 300,000 to 350,000 copies of both packages are now in use, not counting those units bundled with personal computer hardware.

Ashton-Tate's Dbase II and Software Publishing, Inc.'s PFS File are the most popular data base programs, the study reported, with Ashton-Tate's revenues around $35 million to $40 million in 1983, a dramatic increase over the 1982 $7 million to $8 million level.

The market for accounting software, the report continued, reached nearly $300 million for office personal computers last year, up from the $150 million to $170 million level in 1982. The report also indicated that the market for Apple II and Apple II-compatible software will grow to over $800 million over the next three years from a current level of $330 million.

The IBM Personal Computer and Personal Computer-compatible software market, the report added, will grow at more than 60% a year on average over the next five years, from $500 million in 1983 to $6.3 billion by 1988. Big Blue, the report contended, will retain less than 20% of the market for this software by 1988, with third-party software firms accounting for the rest.

"The Office Personal Computer Software Market Report" is available for $3,000.

Future Computing, 900 Canyon Creek Center, Richardson, Texas 75080.

COMPUTER INDUSTRY

NICKELS & DIMES

Honeywell, Inc. has authorized a 2-for-1 stock split in the form of a stock dividend, with additional shares to be issued on or about Feb. 6 to shareholders of record Jan. 6.

■

Bolt, Beranek & Newman, Inc. has filed a registration statement with the Securities and Exchange Commission covering a public offering of up to 927,500 shares of common stock. The underwriting group will be led by Merrill Lynch Capital Markets.

Monolith-Weber Corp. has announced revenues of $5.6 million and a net loss of $112,000, or 3 cents per share, for the three months ended Nov. 30, compared with revenues of $5.5 million and earnings of $296,000, or 8 cents per share, for the comparable period last year.

■

Ask Computer Systems, Inc. has reported earnings of $1.9 million, or 16 cents per share, for the second quarter of fiscal 1984, ended Dec. 31, a 127% increase over second-quarter fiscal 1983 earnings of $841,000, or 8 cents per share. Revenues increased 75% to $15.1 million from $8.7 million for the same period last year.

■

Computer Sciences Corp. reported a 9% profit increase on 2% lower revenues for the third quarter ended Dec. 31. Net earnings were $4.2 million, or 30 cents per share, compared with $3.9 million, or 28 cents per share, a year ago. Revenues were $168.5 million for the period, compared with $172.3 million for last year.

■

Seagate Technology, Inc. has reported a 351% increase in revenues and a 370% increase in net income for the second quarter ended Dec. 31, compared with the same period last year. Revenues were $91.7 million, up from $20.3 million, and income rose to $9.6 million, or 22 cents per share, from $2 million, or 5 cents per share, a year ago.

■

FCC from page 81

sive capital spending plan in any way.

However, Karen Mulvaney, who tracks MCI for Rothchild Consultants in New York, said the savings could be applied directly to capital spending or advertising costs, putting less pressure on the company to go to money markets or the stock exchange for funds. Mulvaney added that MCI cannot really accelerate its expansion program any more than it has, as "it's growing its network as fast as it can."

But don't be surprised to see MCI give an extra boost to its electronic messenger service, MCI Mail, started last October. Already the service has 80,000 subscribers, with an attainable goal of 200,000 by year's end. MCI would like it to become a money-maker soon, and a little extra investment now might hasten movement into the black.

■

By now most everyone has experienced Apple Computer, Inc.'s thoroughly unique Orwellian television advertisement, the one with the blonde woman heaving a sledge hammer through a megamonitor being viewed by legions of automatons.

The ad, part of Apple's $16 million media blitz, has people scratching their heads about its meaning, especially people who don't work with computers day after day. But it shouldn't leave any doubt about its effectiveness. With one strategic 30-second spot during the Superbowl, Apple became as talked about at water coolers last Monday as the big game itself. Even if you didn't get the gist of the meaning, you certainly came away with the words Apple and Macintosh emblazoned on your mind.

As to the meaning — obvious to some, obscure to many — Orwell's state and its ubiquitous, mind-narrowing messages have been replaced by IBM in the Apple scenario. Macintosh will liberate users from a burgeoning IBM world, giving them a fresh and clearly preferable departure from the offerings of the monolithic blue giant, the message continues.

Comparing Apple's ad with the more mainstream exhortations of IBM, or any other vendor for that matter, is like comparing the Superbowl with the world curling championships. But will it sell computers?

■

What's up, DEC?

That's what a lot of analysts and Digital Equipment Corp. watchers have been asking for the past several months. First the company shocked the industry with its dismal first-quarter results last October, then reshocked most analysts this month in posting record sales and profits that were double most predictions.

While this recent upbeat piece of news from DEC provoked a 10-point spike in its per-share stock value, at the same time it has DEC watchers wondering just what is going on. How could things deteriorate so quickly and unexpectedly in one quarter, then bounce back so resoundingly the next? Just what were those administrative foul-ups to which the company attributed its first-quarter failings? Will the next surprise be a sooner-than-expected high-end VAX announcement?

There is one surprise to be unveiled the first week in February concerning a major thrust by DEC into a new arena, the $2 billion off-site storage and recovery market. We'll have to wait to see what that and other surprise announcements bring from DEC.

HP from page 81

customer feedback reportedly indicates widespread satisfaction with the firm's efforts to keep the 3000 family technologically current.

"Our existing product line doesn't suffer either in price/performance comparisons or in benchmark tests with competing systems already available in the marketplace," the spokesman said.

In other developments during the recent security analysts' meeting, HP Executive Vice-President Paul Ely reportedly declined to discuss the Model 150's projected sales figures for the first two months of this year. But in a move that the spokesman characterized as "highly unusual," Ely did project the company's combined 1984 microcomputer shipments at more than 200,000 units.

The HP 150, HP's first personal computer optimized for business applications, will account for "well over half" of those predicted shipments. Although it was introduced only last September, the HP 150 has already attracted 679 authorized dealers — a higher than expected sign-up total — and will likely gain another 300 or so additional dealerships by mid-year, the spokesman said.

BECOME A VSAM EXPERT.

SysEd's new 5-day VSAM course will make you a VSAM expert. You'll not only learn how VSAM works, but *how to make it work well*, and what to do if things go wrong. Even if you're already using VSAM, you'll gain a better understanding of its capabilities and flexibility . . . like how to select among the options VSAM offers for configuring data sets, both batch and on-line.

Our hands-on case study instruction begins the very first day. You'll write and test three real-life programs and use Access Method Services on our own 4341 / II computer. There are eight 3270 terminals dedicated to the class. You'll receive individual attention from our experienced teachers, and you'll want to bring your actual programming and debugging problems to class.

SysEd's VSAM course contains the most up-to-the-minute information available anywhere, including the latest features and capabilities of VSAM, and is in line with state-of-the-art hardware.

SysEd courses are held weekly and on weekends at our training centers in New York City, Chicago, San Francisco and Dallas. On-site courses at your own computer installation are also available. *Classes are limited.* For early enrollment or more information call Dave Shapiro (212) 889-3386.

Box 897
Framingham, MA 01701-9985

Can you answer these questions on local area networks the way you would have two years ago?

1. Is broad *versus* base band still an important issue?
2. Will local area networks and PBXs co-exist, be mutually exclusive or will one be subservient to the other?
3. What role does VLSI technology play in linking peripheral devices to local area networks?
4. What are the standards?

The March issue of *Computerworld On Communications* will give you answers to all the questions above—and much more. You'll get an overview that takes a close look at LAN products and technology and then examines it in the light of competing PBX technology.

You'll get information on linking mainframe computers and local area networks. You'll get an examination of token ring technology. And there's more! You'll get lots of special feature articles on communications topics from "Who the Bell operating companies are buying from" to a profile of Rolm Corporation. Take a look at what some of our other features will cover for you:

- Communications processors.
- R&D in communications companies.
- Fiber optics.
- The low end of the PBX market.
- International record carriers.
- Workstation telephones.
- The future of Centrex.
- Protocol conversion.

Computerworld On Communications is designed to give you in-depth coverage of the broad spectrum of voice, image and data communications from a systems perspective. As a *Computerworld* subscriber, you'll be getting six issues of *Computerworld On Communications* in 1984—as part of your subscription! And if you need to be on the cutting edge of networking technology, you won't want to miss the March 14th issue.

If you've got communications products our readers should know about, then you need to get your ad reservation in by February 3rd. The materials are due one week later on February 10th. To reserve ad space in the March 14th issue of *Computerworld On Communications*, call one of the sales offices listed below, or call Ed Marecki, National Sales Director at 617-879-0700.

Communications.

How to tie things together today without being tied down tomorrow.

This April, *Computerworld Office Automation* will give you a close look at the world of communications products and services. You'll read about what's out there now and what's coming. And how to get started while leaving your architecture open for the technologies of the future. And you'll get it all from the perspective of end users who have to increase productivity *now* while making sure the their company's investment won't be obsolete in two years.

And that's not all. There'll be feature articles on:

- PBX versus local area networks and how they'll merge
- voice technology
- videoconferencing technology
- satellite technology
- inter and intra company communications strategies
- product evaluations and comparisons

And after we cover all the developments for you, we'll offer you strategies to link them all together into one integrated system.

Computerworld Office Automation is designed to give you OA information geared to the DP/MIS environment — in a way that no traditional office publication can. As one of *Computerworld's* 114,000 subscribers in the U.S, you'll get six issues of *Computerworld Office Automation* in 1984 — as part of your subscription! And if your users need to increase their communications links, you won't want to miss this issue devoted to Communications in the office.

If you've got office automation and office communication products our readers should know about, then you need to get your ad reservation in by March 2nd.To reserve ad space in this April 11th issue of *Computerworld Office Automation*, call one of the sales offices listed below, or Ed Mareski, National Sales Director at 617-879-0700.

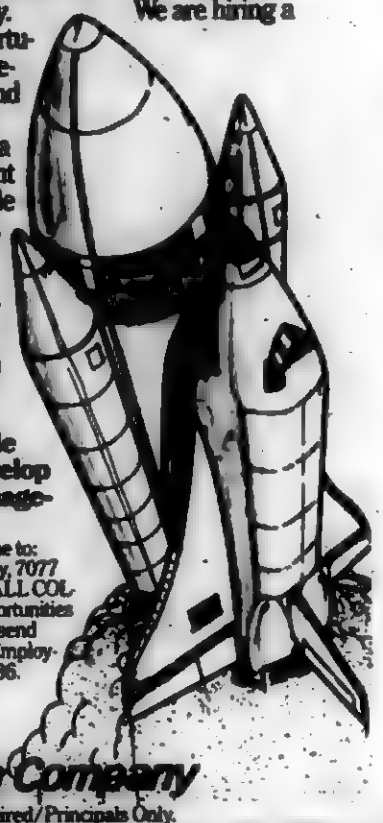
COMPUTER PROFESSIONALS

With Current Experience In Applications Software, OS/SW, Communications Networks, Compilers, DBMS and Development Tools.

We are now assuming our responsibilities as the Shuttle Processing Contractor for NASA at the Kennedy Space Center, Florida and the U.S. Air Force at Vandenburg Air Force Base, California. This six year contract (with options to fifteen years) will provide you with a secure opportunity to join the team of professionals like yourself who are making a significant contribution in the manned space program.

If you are an experienced computer professional whose goal is more challenging and rewarding work in a state-of-the-art environment, look to Lockheed Space Operations Company. We are hiring a number of professionals, like you, to fill opportunities involving the development and enhancement of: Applications Software (Real-time and Interactive), Operating Systems Software, Communications Networks, Compilers, Data Base Management Systems and Development Tools. You will be working on the Space Shuttle Launch Processing Systems (LPS), which is a highly distributed network of over 300 MODCOMP Super Mini Computers and a large number of Honeywell 6000's with over 3.5 billion bytes of mass storage. Some of these opportunities will involve a three month program to become familiar with the entire LPS and the space system unique OS/SW.



We also have opportunities available for MIS Applications professionals to develop a wide variety of on line Data Base Management Systems.

For immediate consideration call or send your resume to: Donald C. Quirk, Lockheed Space Operations Company, 7077 North Atlantic Avenue, Cape Canaveral, Florida, 32920. CALL COLLECT (305) 799-0100. Candidates who wish to pursue opportunities located at Vandenburg Air Force Base, California should send their resume to: Lockheed Space Operations Company, Employment Office, 1100 West Laure Avenue, Lompoc, CA, 93436.

Sperry in Salt Lake City

Sperry (Communications and Terminal Products, and Microwave Data Transmission Systems), will surprise you with uncommon opportunities for career growth in data communications, computer research and development, and microwave communications systems for military programs. The company is committed to research and maintaining a leading edge technology in both hardware and software systems.

Salt Lake City is a center for culture in the west. There's the Utah Symphony, the famed Ballet West, The Mormon Tabernacle Choir, theatres, an art complex, and a strong educational life built around the University of Utah, Westminster College, Brigham Young University, as well as other major universities and junior colleges in the immediate area. Coupled with the grandeur and lifestyle of the Great Salt Lake Valley, a career at Sperry can be one of the most pleasant surprises one could uncover for a rewarding future.

—An Equal Opportunity Employer—

What are the cold, hard facts on computer salaries?

Find out in our new, free Salary Survey.

No doubt during 1983, you knew that many organizations took a hard line on awarding liberal salary increases.

The effects of the salary freeze were felt by many computer professionals. Firms enacted across-the-board cuts, lowered compensation ranges for "new hires," restricted bonuses and benefits or set forth other policies to lower their personnnel costs in countless situations.

Yet, on the other hand, did you know that salaries for *some* computer professionals *soared* right on through the uncertain business outlook?

A favorable climate for skilled professionals.

Our *1984 Computer Salary Survey and Career Planning Guide* will give you new insight on trends that impact compensation, provide current salary figures and review ways the computer profession will be affected in the future. It will also explain why many computer professionals are able to advance their careers more successfully than others.

In the new Survey, you'll learn how salary differences between computer professionals are becoming more pronounced than ever:

- How some professionals—performing the same work and having a similar amount of experience—are earning significantly more than their peers.
- Why some professionals now earn as much as 25% more than they did last year.
- What emerging skills are most in demand and which positions command high salaries now and in the future.
- How size of firm and computer installation greatly affects compensation levels.

Cold, hard data with helpful tips.

The new Survey is based on contacts with more than 44,000 computer professionals and 35,000 organizations. Not only are salary averages for fifty-eight positions reviewed (including ten new ones which we never before covered), but high and low compensation ranges are also covered.

Included are positions in programming, software, systems design, data base/data communications, Edp auditing, operations, computer sales, marketing, marketing support and management. The new 32-page Survey is available without charge.

Since 1968, this annual report has helped approximately a quarter of a million computer professionals understand current trends in technology and compensation, realize how and where they fit in and what they need to do to reach their fullest potential.

Source Edp is the world's largest recruiting firm devoted exclusively to the computer profession. Because each of our professional staff has had extensive computer experience prior to joining our firm, we are able to provide remarkable insight on computer careers.

You owe it to yourself—especially if most of your career lies ahead—to call or write for your free copy today.

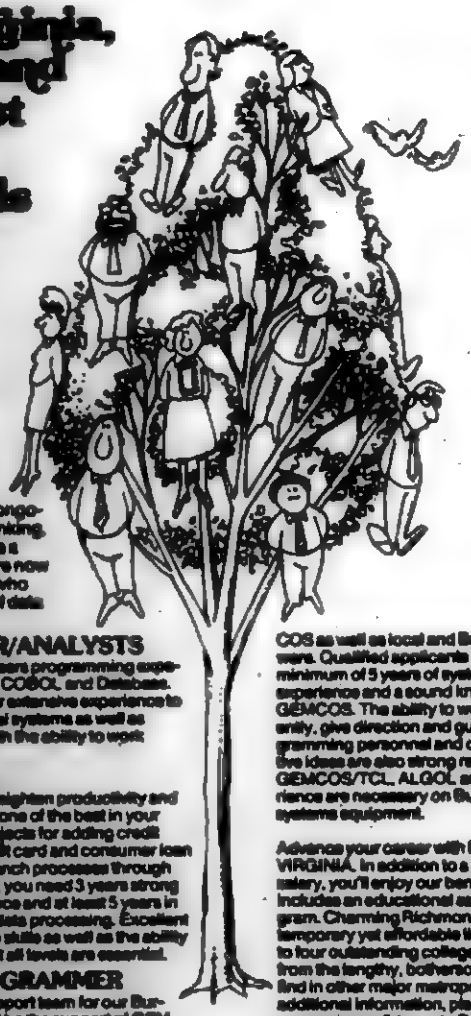
POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS

At Bank of Virginia, we understand that the best computer professionals don't grow on trees



That's why our offers are better, and we've structured our environment to lend itself to advancement.

Through a solid commitment to ongoing expansion and innovative thinking, BANK OF VIRGINIA has become a pacesetting industry leader. We're now seeking exceptional individuals who want to join our fast-track team of data processing professionals.

SENIOR PROGRAMMER/ANALYSTS
Positions require a minimum of 5 years programming experience which should include heavy COBOL and Database. Successful candidates will use their extensive experience to design and implement new financial systems as well as enhance existing ones, coupled with the ability to work independently.

SYSTEMS ANALYSTS
If perfecting excellent systems to heighten productivity and flexibility intrigues you, and you're one of the best in your field, you'll enjoy our two major projects for adding credit scoring/risk monitoring to our credit card and consumer loan systems and a study to improve branch processes through advanced technologies. To qualify, you need 3 years strong financial systems analysis experience and at least 5 years in programming or related technical data processing. Excellent analytical and writing/presentation skills as well as the ability to work independently with users at all levels are essential.

SENIOR SYSTEMS PROGRAMMER
You will be part of our technical support team for our Burroughs 7900. Your major duties will be the support of GEMCOS as well as local and Burroughs software. Qualified applicants will possess a minimum of 5 years of systems support experience and a sound knowledge of GEMCOS. The ability to work independently, give direction and guidance to programming personnel and develop innovative ideas are also strong requirements. GEMCOS/TCL, ALGOL and COBOL experience are necessary on Burroughs large systems equipment.

Advance your career with BANK OF VIRGINIA. In addition to a competitive salary, you'll enjoy our benefits package that includes an educational assistance program. Charming Richmond, VA offers a contemporary yet affordable lifestyle, proximity to four outstanding colleges and freedom from the lengthy, bothersome commute you find in other major metropolitan areas. For additional information, please forward your resume in confidence to D. Gregg Paul, BANK OF VIRGINIA, Operations Center, P.O. Box 25870, Richmond, VA 23260, or telephone (804) 747-3828.

We are an equal opportunity employer

Bank of Virginia

Greyhound is on the move for professionals interested in the diversity and advancement opportunities offered by our Fortune 100 corporation. Challenge, excitement and a fast-paced growth environment are waiting for you at our corporate headquarters in Phoenix.

We have an IBM/MVS environment running state-of-the-art systems. We are currently seeking career oriented individuals to join our Systems Support Group.

SYSTEMS PROGRAMMER

to assume responsibility for ACF/ VTAM/NCP in an MVS environment. The ideal candidate will also have experience in one or more or the following: 37X5, MSNF or distributed processing. The current environment consists of a national SNA communications network involving local and remote hosts, terminals, and distributed systems.

APPLICATION SUPPORT SPECIALIST

to assist the development of effective and efficient Data Communications program applications through 1) technical review of application design 2) application design assistance and 3) development, maintenance and enforcement of standards. Other areas of responsibility will include technical support of the CICS software products. We need a professional with no less than 3 years direct experience with IBM's CICS product and who will welcome the high level of personal interaction needed in this exciting position.

We offer an excellent compensation and benefits package including medical and dental coverage for you and your dependents. To be considered for these positions, please forward your resume including salary history and requirements to:

MARKETING REPRESENTATIVES

If You Believe In Yourself
Join A Company That Believes In You

Terminals Unlimited is a 1980s success story. In only five years, we have experienced phenomenal growth. Why? . . .

Because there's no market saturation for our product: selling, leasing and servicing state-of-the-art in processors, terminals, printers, and other peripheral equipment . . . and meeting a very diverse range of customer needs.

Because of our goal: A nationwide organization completely devoted to providing the best there is in customer service.

If You Believe In Our Goal . . .

And you're a real professional experienced in selling data communications systems, computer products, and supplies; if you have direct sales experience with government or commercial clients; if you can appreciate our potential . . . talk with us.

Terminals Unlimited offers an excellent base salary, one of the best commission plans in the industry, and competitive fringe benefits.

If You're Our Kind of Professional . . .

Let us know. Send us your resume — or call David Owens directly at (703) 237-8666.

Freedom to make a difference

AT&T Bell Laboratories has openings in the following areas of expertise:

- ☐ Communications planning
- ☐ Communications protocols
- ☐ Computer networking
- ☐ C'
- ☐ Database management
- ☐ Digital services
- ☐ Distributed signal processing systems
- ☐ Local area networks
- ☐ Market definition for new technologies
- ☐ Measurement systems
- ☐ Network optimization tools
- ☐ Network planning
- ☐ Operations automation
- ☐ Packet switching
- ☐ Performance measurement and analysis
- ☐ Software development tools
- ☐ Subjective testing
- ☐ UNIX™ Operating System
- ☐ UNIX System applications

These openings are at our facilities in New Jersey, Illinois, Ohio, Pennsylvania and Massachusetts.

Having an impact, doing important work, creating something significant–even memorable–there's no feeling in the world quite like it.

We offer you an excellent opportunity to make this kind of technical contribution...

Because of the variety and interdisciplinary nature of our work.

Because of the considerable resources placed at your disposal.

Because of the caliber of the people around you.

Because of the freedom to pursue your own approaches to problems.

And because we are now free to take the knowledge behind the most extensive and sophisticated communications network in the world and apply it in new ways-to new markets.

With the development of new and expanding projects, we are seeking people who can evaluate alternative architectures, perform competitive analyses, assess service viability, define, implement and measure systems or develop strategies to get products to market.

If you have a Master's or PhD in Systems Engineering, Computer Science, Electrical Engineering, Mathematics, Physics, Statistics or Operations Research with hardware and/or software experience–or a BS in these fields with a minimum of 5 years highly relevant experience –and are looking for a chance to make a difference, please send your resume to:

EDP Professionals

Middle South Services has one of the South's largest data processing centers serving one of the nation's largest power systems. Middle South Utilities, our parent company, is a major electric utility. Our hardware environment includes two IBM 3081s, and IBM 4341 and Tandem mini 16s. If you are a career-minded EDP professional, we have the following opportunities available:

PLANNING AND CONTROL ANALYST A current opening exists in our Planning and Control section for an Analyst to work on the implementation and training of a systems development methodology package. The ideal candidate will have a B.A. in Business and 2-3 years experience in a computerized environment monitoring compliance with systems development standards, with an emphasis on planning and control. Experience in development of methodology is a strong plus with experience on methodology software packages.

PROJECT LEADER With strong hands-on management background to work on an on-line distribution, construction and operating system. Requires at least 1-plus years experience as a first-line supervisor or lead analyst on a medium to large-scale system utilizing IMS DB/DC and involving maintenance, enhancement and program performance.

ANALYST/PROGRAMMER (DATA SECURITY) An experienced computer professional is needed to work with the development and support of data security requirements for on-line systems. The ideal candidate will have previous applications programming experience utilizing IMS DB/DC along with a desire to develop technical and analytical skills pertaining to security issues. Previous data security experience preferred, especially heavy usage of ACF 2.

SR. ANALYST/PROGRAMMERS (APPLICATIONS) Several positions are currently open for experienced IMS DB/DC Analyst Programmers. Experience with COBOL or PL-1 in plant maintenance or business applications is needed. ADF experience is helpful but not required.

Due to our size and scope of operation, we offer access for advancement, career stability and an excellent salary with major benefits. For more information, call our number below or to apply directly, send your confidential resume to Byrnes Heath or Richard Jackson, MIDDLE SOUTH SERVICES, INC., P.O. JOIN ONE OF THE WORLD'S FASTEST GROWING AIRLINES (SINGLE OR FAMILY STATUS)

SAUDIA is one of the world's fastest growing international airlines, which now operates over 60 jet transport aircraft to major cities in Asia, the Middle East, Europe and North America. SAUDIA's expansion has created opportunities for key management and analyst positions in the Computer Operations and Development section of its Data Services Department at its Jeddah headquarters. The processing power of multiple 3XXX IBM mainframes is provided to all major functional areas of the airline, using standard IBM software products (MVS, CICS, IMS DB/DC, TSO) and well-established proprietary packages (Lifeskies, TOTAL).

We are now looking to appoint the following computer professionals:

MANAGER, COMPUTER OPERATIONS
$3699 Per Month Tax Free*

The Computer Operations function is responsible for the integrity of SAUDIA's data processing operations, which include multiple on-line systems (IMS and CICS) operated around-the-clock and internal timesharing (TSO) during normal working hours. The role of Manager, Computer Operations is to direct the activities of a Staff Manager-Computer Operations, who is responsible for the supervision and scheduling of shift personnel, and a Project Manager-Technical Support Group, who is responsible for the implementation and maintenance of procedural standards and quality control of production systems. The manager also has cost center responsibility for the operation of the data center. A minimum of ten years large-scale IBM computer operations experience, or a bachelor's degree and at least six years relevant experience, is required. Proven management skills and at least two years prior experience with MVS operating systems, change control procedures, and system performance standards is also required.

MANAGER, MARKETING SYSTEMS
$3699 Per Month Tax Free*

The Marketing Systems function is responsible for monitoring the functional performance of the hosted reservations service, coordinating system requirements with affected user departments, and participating in feasibility studies for new reservations/departure control enhancements and evaluations of alternative reservations software packages. The role of the Manager, Marketing Systems is to manage a group of PARS/ACP applications analysts and to coordinate directly with SAUDIA's Marketing department on all matters relating to airline reservations, passenger handling, travel agency automation, and departure control systems. A bachelor's degree and project management experience is required, with a minimum of ten years IBM analyst/programming experience and at least three years direct involvement with an ACP system for reservations and/or departure control.

SENIOR SYSTEMS ANALYST
$2801 Per Month Tax Free*

Experienced senior analysts are required in several positions to lead requirements analysis and program specification efforts to define system requirements for application development. Functional areas include financial systems, accounting, maintenance & engineering, and flight operations. Prior experience in COBOL applications and structured programming techniques required; exposure to YOURDAN and/or SPECTRUM methodologies, previous airline experience, and working knowledge of IMS and/or TOTAL databases helpful. A minimum of two years relevant software development experience, or a bachelor's degree and six years experience, required in a large-scale IBM environment with on-line and/or DBMS applications.

BENEFITS

Free furnished air-conditioned housing and utilities • Paid medical insurance • 30 day vacation with positive space travel for family to and from domicile • Free or reduced rates on SAUDIA and other airlines • Retirement program (social insurance after 15 years service) • Household shipment from domicile to Saudi Arabia and back • K-8 schooling for children — out of Kingdom financial assistance for other grades • Annual service increase and eligibility for yearly merit bonus based on performance.

*The indicated salaries are available to U.S. and Canadian citizens, and have been converted from Saudi Riyals to U.S. dollars at the current rates of exchange, which are subject to fluctuation. Salaries are tax-free, subject to normal qualifications.

Positions are offered on a two-year contract. In your reply, please indicate your position preference. Send resume to:

HOW TO MAKE OVER $80,000.00 A YEAR ON CICS COMMAND LEVEL PROGRAMMING

Acquire one of the most demanded & rewarding programming skills in months instead of 2 years. A complete self-study book based on CICS latest version 1.5, written in COBOL and with special emphasis on VSAM. It covers virtually every CICS technique you will ever need. Fifteen sample programs address all CICS major applications. Over 150 ready-to-use examples. Sample programs include: Menu, Add, Update, Delete, Browse, Print 24x80, Print 66x132, Print Any Size Report, Message Routing, Screen Refreshing, VSAM Alternate Index Setup and Manipulation, Constant Table Setup and Use and more.

It is hard to believe the learning can be so easy until you try it. In hours, you can start to create your own BMS maps; in days, you can start to write your own pseudo conversational CICS programs. Some CICS techniques are especially hard. When you are stuck for the technical problems, you'll be thankful you have this book.

Moonlighting on CICS projects is very rewarding. A typical 10-screen system can mean $15,000 cold cash. This book also tells you how to market your services, locate the contracts, write a proposal, make a presentation, quote the right price & draw a contract agreement without a lawyer.

But act now. Send $34.95 (plus $2.00 for ship. & handl.) or $32. ea. for 2, $30 ea. for 3, $28. ea. for 4 and over. (ship. & handl. incl.) in Check or money order to: CCO ONLINE SYSTEMS, INC., P.O. BOX 795759, DALLAS, TX 75379. Allow 1 to 2 weeks for delivery. Full refund within 10 days if not satisfied.

300 DP Openings

#1 employment agency, #1 DP employment consultant for 1982 in RPA (139 agencies, 900 consultants), now #1 agency in NPC (160 agencies, 450 consultants). Fee paid.

Professional Master's Degree Computer and Information Science

Advance your career in information systems through Dartmouth's distinctive professional program. Our two-year program is designed to equip you to take a leading role in planning, designing, and developing effective business solutions to business problems.

In the CIS Program, you will study current methodologies for planning, analysis, and design; strategies and issues in the management of information systems; business organization; project management; database systems; networks and distributed processing; professional communication. Learn from guest lectures by practicing managers of information systems, case studies, and professionals-in-residence. An internship is required of each student.

If you have previous experience in the computing field but want to be equipped to assume more responsibility and leadership, consider joining us next year. For more information, write: Program in Computer and Information Science, Dept. C, Nathan Smith Building, Hanover, NH 03755.

Software engineers. The time is now.

Computers play a vital and ever-increasing role in every step of production at Kodak. And we need skilled professionals who want to share in the challenges and rewards of technological leadership.

We're looking for talented software and computer engineers with a BS or MS and technical experience in minicomputer and microprocessor systems used in the development of software for real-time equipment control. Assignments may involve design of software systems for products or manufacturing control; programming mini- and/or microcomputers; integrating computer software and hardware into complex electromechanical systems; and quality assurance of computer programs.

Kodak also has opportunities for electrical engineers in the areas of design and development, video, test, systems and optical engineering.

We offer competitive salaries, liberal benefits, and opportunities for individual contribution and growth. Positions are available now. If you have the necessary skills and drive to meet the challenge of working for a corporation in the forefront of technology, send your resume today.

CAREERS IN MANAGEMENT INFORMATION SYSTEMS AT ... HARRIS

In Florida.

You know how important it is to work with a company that offers exciting career opportunities, competitive salaries, full employee benefits, and management appreciation for a job well done. **HARRIS** offers all this and much more. We are a highly-diversified, international Fortune 200 communications and information processing company with fiscal year 1984 sales projected at $2 billion. Our products, systems, networks, and components are sold in more than 100 nations world-wide. And we offer these challenging positions on sunny Florida's exciting Space Coast, located thirty miles south of Cape Canaveral and one hour from Disney World and Epcot.

TELECOMMUNICATIONS

Manager: Responsible for all voice/data communications services for our Government Systems Sector, including system design, installation, operation, and maintenance of digital PBX and local area network. BSEE preferred; US citizenship required.

Data Communications Analyst: Responsible for data communications planning and system engineering, new service specifications, ordering and installation coordination, and problem resolution. Five years experience in data communications required, with knowledge of communications equipment and common carrier services. BSEE required.

Software Specialist: Works with users to implement on-line systems in IDMS/DC and CICS and provides training in these systems. Plans future software usage strategies and assists with conversions to newer systems. Must have three to five years experience in developing on-line systems, one year in IDMS/DC environment, BSCS, BSBA, or degree in related discipline required.

Network Analyst: Provides guidance and direction to M.I.S. management and data communications user community. Responsible for project coordination for large corporate data center. Knowledge of SNA software and hardware required. BS required.

Tariff Analyst: Analyzes national and state communications tariffs for impact on users. Will become expert on regulatory issues. Three to five years in modeling, business analysis, and statistical analysis is required. BS in Statistics, Financial Analysis, or related discipline.

Voice Communications Analyst: Assists in the management and procurement of PBX systems. Includes requirements analysis, cost justification, selection, and project management of implementation. Three years related experience. Bachelors degree required.

ENGINEERING SOFTWARE

Specialist: Supports Computer Automated Engineering (CAE) in electrical and mechanical areas. Examines, helps select, and tests software packages. Maintains knowledge of tools and has knowledge of languages such as ADA, *C*, and LISP. Provides technical supervision of small Engineering Computer Center. BSEE required. Masters preferred.

Programmer: Prepares and supervises preparation, testing, and documentation of programs, and reviews existing programs to recommend changes. Three years experience in engineering applications. BSCS or BSEE required.

SYSTEMS

Financial Systems Analyst: Assists users in implementation and turnkey problem resolution, and maintenance of financial package software. Must know COBOL and OS/JCL. 15% travel. Knowledge of IDMS/DC preferred. BS required.

Technical Representative: Responsibilities include systems analysis, project management, and customer account management. Experience with large-scale MVS or VM data center and JES3, TSO, VM/CMS required with knowledge of FOCUS, SAS, IDMS, IFPS, INFO a plus. BS required, MBA a plus.

Senior Systems Programmer: Responsible for data base and data communications software systems, including ACF/VTAM, ACF/NCP, TSO, IDMS/DB-DC, and CICS. Three years experience in an IBM MVS/SP environment required. VM/SP experience a plus. BS required. Masters a plus.

Billing Analyst: Responsible for maintaining charge-back system for computer resource utilization, system modifications, and management reporting. Three years programming experience in large IBM mainframe MVS environment and 1+ years of SAS programming experience required. Prior billing experience and use of JARS a plus. Bachelor's degree required.

SECURITY

Analyst: Evaluates, assesses and eliminates areas of vulnerability in current data processing systems. Requires experience with IBM 3081, 4341, and 3705 systems. BSCS or BSEE required. Masters preferred.

SYSTEMS PROGRAMMER

Challenges matched to your expertise ...facilities to make the most of it.

As a diversified leader in energy systems, Combustion Engineering is advancing the technologies needed for energy solutions. In our highly sophisticated state-of-the-art Computer Center located in Windsor, Connecticut, we're solving complex business problems by applying the capabilities of one of the most comprehensive data processing and communications networks in operation. The challenges are here for those who are up to them. The environment is right for demonstrating technical leadership.

As a Systems Programmer, you will be heavily involved in modification and maintenance of IBM systems control programs, as well as major subsystems and access methods. Your qualifications will include a minimum of 4 years experience with the internal structure of JES-3 and at least one of the following major IBM systems control programs or subsystems: MVS, SMP/SMPE or VM.

In addition to offering an excellent salary and a fully-paid benefit package, we provide computer time during the day. No more having to be at the Data Center at midnight to do your testing.

For prompt, confidential consideration, forward your resume, including salary requirements, to: Mr. Vincent C. Vallario, Jr., Combustion Engineering, 90 Lamberton Road, Windsor, CT 06095.

and other cities across the U.S.

Careers are yours for the making.

HP offers more than a job. You can reach the top of your field right across the nation. But you'll need to be creative, enthusiastic and have the business maturity and technical know-how to interface effectively with end user decision makers.

Two areas of opportunity for Experienced Field Sales Representatives -

Technical Computer Sales

These positions are responsible for selling HP's technical computer products to scientific, technical and manufacturing customers in your assigned territory.

Besides degree or equivalent, 2 years' successful CAE/CAD/CAM or manufacturing minicomputer sales experience is desirable.

Commercial/Business Computer Sales

These positions are responsible for selling large-scale minicomputers, primarily to the manufacturing market. As well as managing the existing customer base in your assigned territory. Besides degree or equivalent, 2 years' successful business computer sales experience is desirable.

Invest in your future... long term.

We rank high among major computer companies in terms of sales growth, earnings, product innovations and employee retention. This means career stability... year in and year out. It starts with in-depth training for up to 10 months, covering every aspect of the business... from learning the HP product line to the most sophisticated sales techniques. You'll quickly gain hands-on experience working with senior HP people.

With HP you'll reap the benefit of rapid production, delivery and installation, plus strong pre-and post-sale technical support. Because our credo is "productivity - not promises."

Consider the HP advantages.

Besides excellent compensation and benefits, you'll find your career progression with us a lot smoother than what you've experienced in the past. For immediate consideration, please send your resume with salary history, indicating your preferred city.

Programming

•Senior Programmer Analysts •Systems Analysts •Senior Systems Analysts •Software Support Specialist

Computer Sciences Corporation's National Flood Insurance Program is continuing its expansion into numerous projects that offer opportunities ranging from heavy restructuring and enhancements through "groundbreaking" systems analysis, design and development, to requirements identification and specification writing. The following positions may contain the senior analysis functions, the technical development, or increasing responsibilities that will advance your current career.

• Senior Systems Analysts and Systems Analysts

This unit will aid in initiating a major, nationwide sub-system that emphasizes extensive specification writing, requirement and element analysis, general design and development, and heavy client interface. Qualifications include minimum six years of COBOL programming, preferably on OS IBM environments, two years of independent systems analysis, and good written and verbal communications skills. CICS experience, project leadership, and insurance applications are extremely desirable.

• Senior Systems Analysts and Senior Programmer Analysts

This team will be responsible for major systems and programming analysis, redesign, redevelopment, and modification efforts for primary sub-systems. Qualifications include three to six years of COBOL programming background. MSA, accounting/financial applications and CICS experience extremely desirable.

• Software Support Specialist

This individual will provide technical guidance and procedural development for our data processing center, specializing in all systems programming functions. These responsibilities include analyzing software utilization, developing all performance measurement and benchmark testing efforts, and system optimizing and troubleshooting the major on-line systems. Qualifications include five to twelve years of systems programming background including heavy OS MVS internals, command level CICS, and two years operational knowledge of DASD and VSAM.

Our environment features the IBM 4341 and 3083, running OS MVS, CICS, and TSO SPF.

CSC offers easy access off the Beltway, a professional work atmosphere, competitive salaries, and a benefits package including tuition reimbursement, pension plan, stock option, credit union, and employer-paid medical/dental plans.

For immediate consideration, please call Mr. Rex Scott at (301) 982-2107 or send resume. After-business-hours and weekend interviews can be arranged at your convenience.

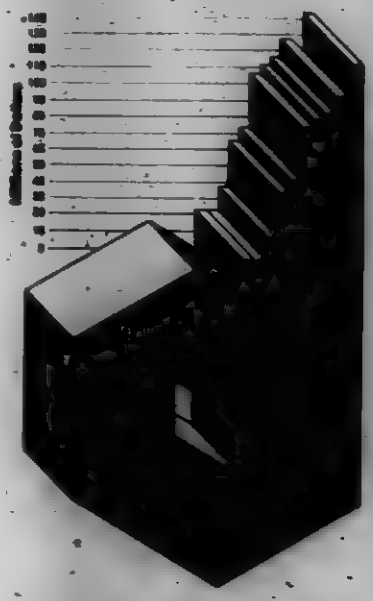
Engineers & Software Designers

BE A PART OF A LIVING AMERICAN SUCCESS STORY!



Since 1961, we have grown from 11 to over 750 employees. As of third quarter, 1983, sales have grown from market entry to over $87 million and order backlog to over $144 million. The reason? Customer oriented design, marketing and servicing of advanced digital switching systems that meet the needs of today...and tomorrow. If you would like to be part of a group that is writing a new chapter in telecommunications history, consider the following areas:

CALL PROCESSING

Design and development of real time telephone, attendant, trunk control and call processing software. Will be heavily involved in the development of central office (Class 5 switch).

MAINTENANCE/DIAGNOSTICS

Design and development of configuration, control and diagnostic software for distributed processing systems.

OPERATING SYSTEM

Design and development of real time operating systems software for distributed microprocessor based systems.

SWITCH ADMINISTRATION

Design and development of administration, data base and message accounting software.

All positions require a BS/MS CS, EE, Math or related discipline. Experience with assembly language and/or "C" highly desirable.

We can offer competitive salaries, extensive company-paid benefits, and excellent potential for professional recognition and advancement. For prompt consideration, please send your resume to:

AUDITOR – EDP

The World Bank, a leading international institution in the field of economic development with Headquarters in Washington, D.C., invites applications from qualified men and women for the position of Auditor-EDP in its Internal Auditing Department. The Auditor is expected to have in-depth competence in data processing and current EDP audit techniques and will participate as a member of a team of EDP specialists in performing audit assignments. After gaining familiarity with the Bank's environment, the Auditor will be expected to perform audit assignments independently.

The successful candidate will, under the general supervision of the Deputy Internal Auditor, be responsible for:

i) reviewing EDP application systems under development or in production for controls and effectiveness;
ii) carrying out operational audits of the computer facilities and information-resource activities in the Bank;
iii) developing and implementing appropriate EDP audit procedures to assist senior auditors in the financial/accounting/operational audits involving EDP systems;
iv) developing and maintaining internal departmental computer systems.

REQUIREMENTS

1) Graduate level education in Accounting, Business Administration and/or Computer Science. A professional qualification and experience in public accounting would be desirable.
2) At least five years' experience in the development and implementation of major business applications and/or systems consulting.
3) Programming knowledge of COBOL and other business-oriented programming languages.
4) Experience with IBM and Burroughs computers, data-base management systems, and intelligent terminals.
5) Excellent written and spoken communication skills.

The World Bank offers a competitive salary and benefits package. The position is based at the Bank's headquarters in Washington, D.C. Please send a detailed resume, quoting reference number: 4-3-USA-9801 to:

The World Bank
Staffing Division
1818 H Street, N.W.
Washington, D.C.20433, U.S.A.

SUNBELT OPPORTUNITIES

For professional and geographic fulfillment, the Sunbelt is where it's at. Enjoy a challenging work environment in "State-of-the-Art" installations and in your leisure time enjoy a life-style that blends with a temperate climate. Our Fortune 500 clients are seeking qualified EDP professionals with a minimum of one (1) year experience in an IBM environment. Client companies assume all fees including interviewing and relocations costs.

Data Processing Professionals

Your success begins with the basics. At Crum & Forster Corporation your success will be based on a firm foundation—the foundation of a Fortune 50 organization with a corporate history going back for nearly a century. From this solid base you can continue to build and shape your career the way you want to, with the building blocks of your own professional abilities, experience and ambition. Here is a 1984 update and a preview of our coming attractions as we continue to build for the future:

Your success is based on a strong foundation at:
CRUM & FORSTER CORPORATION

We are now an MVS/XA shop, and come this spring we will be upgrading our 3081 to a new 3084, and we will be putting the finishing touches on 20,000 additional square feet for our brand new computer facility. We currently have the following professional positions at our Morristown headquarters:

Systems Programmers

3-5 years experience in MVS/SP operating systems JES 2, TSO, MVS/EXITS and SMF. BAL and COBOL coding required. Openings exist in Program Products and Security areas of Technical Services.

Telecommunications Technician

Minimum 5 years telephone, modems, and front-end processor experience. Must have digital and analog test equipment experience and be familiar with IBM protocols.

Data Dictionary Senior Analyst

Data Base startup—4 years minimum experience in data dictionary/catalogue implementation.

Data Dictionary Specialist

To perform data entry and assist in standards and procedures pertaining to dictionary environment.

Programmer/Analysts

3-5 years experience to work on a variety of applications in both batch and CICS areas.

EDP Auditors

Proven EDP audit experience in large mainframe environment, preferably with CICS experience.

We offer competitive salaries based on market value, and a comprehensive benefits package including dental plan and 100% tuition refund.

For immediate consideration please send complete resume in confidence, stating salary progression and requirements to: Personnel Manager, Crum & Forster Corporation, 305 Madison Avenue, Morristown, New Jersey 07960. An equal opportunity employer.

Crum & Forster Corporation

SENIOR PROGRAMMER/ANALYST

Software Engineers!

Xerox introduces a team approach to the future.

Our Resources. Your Resourceful Mind.

Office Automation. It's heralded as the answer to industry's declining white-collar productivity. Where will the office of the future take us? What will it take to get us there?

Xerox feels the answers lie in a collaboration of resources. We call it TeamXerox. Our proven resources: product development, management skills, strategic planning and a firm foothold in today's office is part of the solution. You are the other. Your resourceful mind is the catalyst behind problem-solving innovations, and imaginative planning to keep technology one step ahead of demand.

TeamXerox. It's our approach to an exciting future. Be a part of the success. We have opportunities for Software Engineers at our Office Products Division in Dallas, Texas. Qualified applicants must have the following general credentials:

- 1-10 years product development experience with recent experience on Mini/Micro computers with office automation software.
- Experience with Assembler language and either PASCAL or C languages.
- A BS or MS in Computer Science is highly desirable.
- Experience with CP/M, MS/DOS or UNIX.

The successful candidates will apply their software development skills in the following areas:

- **PROFESSIONAL WORKSTATION**
- **ELECTRONIC TYPING**
- **COMMUNICATIONS**

Qualified candidates must have U.S. citizenship or be registered alien.

As you would expect from an industry leader, Xerox Corporation can offer you an exceptional salary and benefits program along with a relocation package. Send your resume to: **Employment, Xerox Corporation, Information Products Division, MS 180, Dept. CW-130, 1341 W. Mockingbird Lane, Dallas, Texas 75247.** Xerox is an affirmative action employer.

SOFTWARE PROFESSIONALS -

IS YOUR VALUE A WELL KEPT SECRET?

At BGS your efforts, ideas, enthusiasm and innovations are not only encouraged but recognized, depended upon, and rewarded. Period - as in not usually the case elsewhere - BGS professionals see the results of their efforts by maintaining involvement with products from planning through customer use. Our existing products - BEST/1, CAPTURE, CRYSTAL, and INFOBASE - are used by over 600 large MIS facilities, worldwide, and have been the result of our recognition of individual contributions.

If recognition of your efforts is important to you, and if you selfishly envy of the following records, your interest in BGS is important to us!

MVS DEVELOPMENT MANAGER

Lead a team of systems and programming specialists in clarifying and developing product enhancements and new products. The ideal candidate will possess: a degree (MS preferred) in Computer Science, Mathematics, or a related field; a strong technical background in MVS, IMS, CICS; and a proven ability to manage systems professionals.

NETWORK COMMUNICATIONS ANALYST

Responsible for shaping the next generation of BGS network products. Position requires solid network communications, interpersonal, and analytic skills. Experience with voice networks, LAN's, SNA or network performance evaluation and design are real pluses.

DATABASE PERFORMANCE ANALYSTS (IMS DB/DC, FASTPATH, IDMS)

Challenged to dig deeper into the way IMS or IDMS software performs? Take responsibility for an entire CRYSTAL modeling library product and future product line extensions. CRYSTAL is a software tool used to predict the performance of new applications. Database administration or support experience desired.

SENIOR PERFORMANCE ANALYSTS

We need people with advanced degrees in Mathematics or Computer Science to help us develop and extend simulation and analytic modeling methods for use in our performance software products. Candidates should have graduate training in mathematical performance modeling methods. Experience in the areas of VM, MVS or SNA is particularly desirable.

IMS & CICS PERFORMANCE SPECIALISTS

Capable of designing extensions to our performance modeling and evaluation products for IMS or CICS workloads. Position requires: knowledge of IMS or CICS performance and capacity management methodologies; a technical degree; and experience with large programs developed and run under MVS/TSO, VM/CMS, TSO/SPF. Ability to analyze data using SAS a plus.

Additional attractions at BGS include flexible work schedules, an easily accessible location in one of the most enjoyable parts of the country and, of course, a full benefits package including medical/dental coverage and tuition reimbursement.

Please respond to Employee Rel. Personnel Administrator.

COMPUTER OPERATOR

Third shift opening. Minimum 2 years operations experience. Must have knowledge of IBM 4341, CICS, DOS/VSE JCL; previous experience with PDP 11/34 helpful.

VP OPERATIONS

10 years experience with IBM hardware (4341), CICS, DOS/VSE. Management and supervisory experience working with multi companies in medium to large environment desired. Responsible for production control, instituting control procedures, forecasting equipment upgrades and configurations, large terminal network.

INTERMEDIATE PROGRAMMERS

Minimum 3 years experience including COBOL, BAL, DOS/VSE, JCL and CICS.

SENIOR & LEAD PROGRAMMERS

Minimum 5 and 6 years experience respectively, including BAL, DOS/VSE, JCL and CICS. Responsible for implementation of new applications and maintenance of current applications.

SENIOR USER COORDINATORS

Minimum 5 years DP experience with 2 years programming and systems analyst responsibilities. Strong verbal and written communication skills a must. Experience with financial applications, banking and/or mortgage lending desirable.

AVP USER SERVICES

Minimum 8 years systems analyst experience with project management emphasis. Responsible for controlling the installation and maintenance of all banking related systems, coordinating communications with end users.

AVP APPLICATIONS

Minimum 8 years experience with background in IBM COBOL, BAL, DOS/VSE, CICS, JCL. Responsible for controlling installation and maintenance of application software. Heavy experience with management of technical implementation of software desired.

The successful candidates will enjoy a challenging and dynamic environment with growth opportunity. Starting compensation will be attractive to proven professionals. Please send a detailed resume specifying desired position with salary history to:

Learn Why RCA Has The Challenge You've Been Looking For!

RCA's Corporate Information Systems & Services is looking to add very special Computer Professionals to our team at our Cherry Hill, New Jersey campus, just 15 minutes from Philadelphia.

Working in an ultra-modern environment with the latest computing technologies, these professionals will help support two large-scale corporate computer centers that support RCA's world-wide locations. Our equipment includes IBM 3081's a 3083, 3033, 3032, and a 370/ 168 operating under MVS and VM/370. Current plans call for the establishment of multiple distributed systems based on the IBM 4300 family.

VM Systems Programmer

...with at least 5 years VM Systems experience and extensive background in operating systems modifications and problem analysis. Could be proficient with Assembly language and a higher-level language such as FORTRAN, PL/1 or APL. Degree required, preferably in Computer Science, Math, Physics or Engineering.

Data Communications Systems Programmer

...with basic knowledge of hardware such as modems, lines, multiplexors, concentrators, etc., plus Comten/IBM 3705/3725 Gen development experience. You should also have a working knowledge of SNA and MVS and/or VM. Degree required, preferably in Computer Sciences.

Capacity Planner

...to develop systems to measure and forecast use and performance of corporate computers using tools like MICS, BEST/1, and OMEGAMON. Must be able to recommend changes and upgrades to management. You should have at least two years experience in capacity planning or performance management for large IBM systems, plus a degree, preferably in Computer Science.

Computer Services Representative

...to act as liaison between internal personnel and our customers, including consultation on new process technology, cost effective use of resources, new development efforts, and coordination of processing with Center Operations and the customer community. You should have excellent communicative skills, a minimum of 3 years of management experience in MIS and engineering disciplines, and 3 years of MIS systems expertise. Degree required, advance degree preferred.

TALK WITH RCA TODAY! We'll be glad to arrange evening or weekend interviews at your convenience, or you can call or stop in at our Cherry Hill campus anytime for a tour of the facility. See first-hand just how pleasant a challenging work environment can be.

Call Pat O'Neill between 9 a.m. and 6 p.m., on (609) 338-6517 to arrange an interview or send your resume to Pat at RCA Corporation, Building 201-2, Route 38, Cherry Hill, New Jersey 08358.

Computer Technology

Sundstrand, a Fortune 500 industry, has an immediate opening for a Section Manager-Computer Software Technology.

The qualified professional we are seeking will have a college degree in computer science and five years' management or supervisory experience with data processing personnel. IMS database management experience would be a definite plus. A technical background in operating systems for large scale mainframes and a thorough knowledge of general purpose system software are necessary to effectively function in this position.

As our section manager your major responsibilities will be in the installation, generation and modification of all computer software including current systems, related programs and packages, and other internally designed software.

Sundstrand is headquartered in Rockford, Illinois with facilities located worldwide that design, manufacture and market our proprietary aerospace and industrial systems. We offer a competitive salary and a strong benefit package including health and dental, and a liberal holiday schedule. To be considered for this management position, please send your resume and salary history in confidence to: Kathi Handee • Sundstrand Corporation • 4747 Harrison Avenue • P.O. Box 7003 • Rockford, IL 61125.

SUNDSTRAND
An Equal Opportunity Employer

CAREER OPPORTUNITIES IN STATE GOVERNMENT

The New Jersey Department of Labor has immediate career opportunities in our Division of Systems and Communications. Our configuration consists of 2 processors; a 3081-D16 and a 3083 supporting 3380, 3350, and 3330 DASD; tape units; Xerox laser printers and a nationwide network of over 700 terminals. Our software environment consists of the latest releases of MVS, ADF/MCP, ADF/VTAM, CICS and IMS plus many supporting software products. We use both ROSCOE and TSO as interactive development tools. We are a COBOL shop primarily, using Command Level CICS for most on-line applications and we also use SAS and EASYTRIEVE languages in addressing user requests.

APPLICATION PROGRAMMERS/ANALYSTS

Candidates who apply should have a college degree and 3-5 years of recent application design experience or programming experience in COBOL. Applicants who do not hold a degree may qualify if they have 6-7 years recent appropriate experience. The most desirable candidates will have been in designing general business applications or designing code for general business applications utilizing both batch and on-line environments. Supplemental experience in either SAS or EASYTRIEVE is also desirable.

SYSTEMS PROGRAMMERS

Candidates who apply should have a college degree and 3-4 years of recent system programmer experience in any of the above areas. Applicants who do not possess a degree may qualify if they have 7-8 years of recent system programming experience. The experience may be as a specialist in any of the above product areas.

Candidates interested in a career opportunity with a medium sophisticated data processing facility located in Central New Jersey, close to Princeton University and other top rated schools as well as historic and cultural events, should submit a resume with salary history in confidence to:

New Jersey Department of Labor
Office of Personnel Services
Room 1213
John Fitch Plaza
Trenton, NJ 08625
Attn: Glenn Christensen

IMS SYSTEMS PROGRAMMER OPPORTUNITY

BancOhio National Bank, recognized as a leader in advanced business data processing among financial institutions, is seeking a seasoned professional to work with IBM's Relational Data Base architecture (DB2, QMF, SQL).

Successful candidate must have 3 or more years experience working with the interface of IMS, Relational Data Base and CICS experience are a strong plus.

This position provides an excellent opportunity for professional growth and development within a highly sophisticated and dynamic data processing environment which includes a Tandem Non-stop II, 3 IBM 3083's, OS/MVS, JES3, IMS DB/DC, and CICS.

If you meet the qualifications and have the ability to communicate well with peers, users, and management, we would be very interested in talking with you. In addition to an excellent salary, we offer an attractive benefit and relocation package. Interested and qualified candidates please send resume and salary history, in strict confidence, to:

Software Sales Staff Expansion

Join the exciting national expansion of our sales staff which is chartered to double in the coming months creating openings in 20 major metropolitan areas. Our revenue and staff has increased over 70% in recent years and one-third of our sales representatives are earning in the 6 figures.

We have only 2 key requirements.

- You must be one of the top performers in your company.
- A minimum of 2 years' experience selling software to IBM or compatible mainframe environments.

Software AG develops, markets and supports an integrated line of "off the shelf" systems software packages. Our extremely successful product line includes the following:

- **ADABAS**—award winning DBMS which manages the storage, retrieval, and manipulation of data contained in computer storage devices.
- **NATURAL**—a leading 4th generation on-line programming language.
- **COM-PLETE**—TP software package which manages the flow of data without complexity.

We've developed an unsurpassed line of products which meet today's information center/development center needs—while providing flexible tools to anticipate tomorrow's demands as well.

If you sincerely seek a challenging opportunity which gives unique experience, greater rewards, and satisfaction in selling state-of-the-art software packages, then this is **THE opportunity** to pursue.

We want to speak with achievers who are meeting, or exceeding, quota. **CALL us now at (800) 336-3761, ext. 600,** (703) 860-5050, ext. 600 or send resume to 11800 Sunrise Valley Drive, Dept. 1500 Reston, Virginia 22091

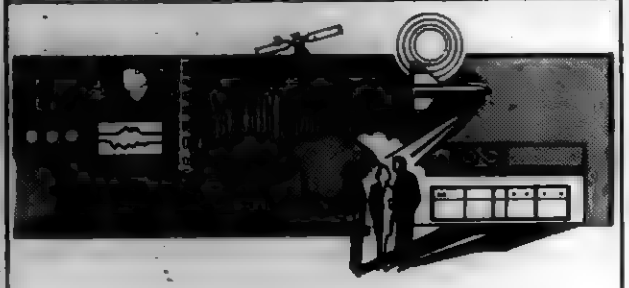
POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS | POSITION ANNOUNCEMENTS

Kearfott momentum. Propelling advances in software... and in careers.



Software professionals who set their sights high will find Kearfott an ideal environment for wider career latitude and exposure to new and developing technologies. In operating systems...commercial applications...and computer software engineering. Right now we're involved in some of the most stimulating projects which depend on strategic software advances in communications, logistics, MIS, and guidance systems.

Join an elite operating systems software group at our Data Center, one of the country's most sophisticated information processing centers, where state-of-the-art innovations are the norm. You'll be maintaining IBM and Amdahl mainframe computers with supporting software that includes MVS/SP3, JES2, IMS DB/DC, CICS, WYLBUR, TSO ACF/VTAM, GDDM, and numerous compilers and program products. Via advanced communication links this Center is tied into all our plants, and you'll be equipped for an instant interchange of technical data. And have the opportunity to support user-friendly software and microcomputers, become involved with educating company users, and consult on and resolve daily problems.

Underlying Kearfott's ability to maintain technical leadership is a solid MIS base whose software applications include accounting, finance, payroll, inventory, and manufacturing controls. In MIS, you'll be part of a team involved in COBOL programming, CICS, MVS, IMS, data base design, and telecommunications.

The challenges in software engineering at Kearfott are ongoing with a broad technological scope: realtime software development...simulation or validation techniques...firmware and microprocessors...Kalman filtering...Fortran, JOVIAL or ADA compilers. If you have strengths in these areas, let us tell you about the diversity of our minicomputer projects and resources.

If you have a minimum of 3 years experience in a large-scale IBM system, with HP, DEC, or airborne minicomputers or microcomputers in realtime military systems, begin your rewarding career path now with Kearfott. Find out why software professionals can aim high here by sending your resume to: E.J. Murphy, Singer Company, Kearfott Division, 1150 McBride Avenue, Little Falls, NJ 07424.

HARDWARE/SOFTWARE PLANNING PROFESSIONALS:

At General Dynamics Data Systems Division, we provide computing power to support our Corporation's diverse, high-technology programs. Right now, we're looking for three computer professionals to work at our St. Louis headquarters:

MANAGER OF HARDWARE/SOFTWARE PLANNING
You will provide strategic computer configuration planning for our Data Centers using workload forecasts; develop and maintain hardware/software multi-year plans, and evaluate and introduce emerging technologies.

COMPUTER SERVICES SPECIALIST
You will define and administer hardware/software configuration management for our large computing complexes; define, review and approve change-control procedures for our Data Centers.

COMPUTER SERVICES SPECIALIST
You will develop annual hardware/software plans, assuring proper execution through purchasing, and provide technological planning information to Center Directors, Account Managers and Division Headquarters.

All positions require at least 10 years' hands-on experience in hardware/software configuration, evaluation and planning for large, IBM mainframe systems; CDC/UNIVAC and DEC operating experience a plus. You should also have good understanding of software used on IBM systems (MVS, JES3, TSO, IMS, CICS), some background in computer center operations and good oral and written communications skills. BSEE, BSCS or related degree required.

General Dynamics offers a competitive salary and comprehensive benefits, which include savings/stock investment plans, life insurance and medical/dental insurance for you and your family.

Send your resume, in confidence, to: **J.H. McBeth, Director of Computing Systems Plans & Control, General Dynamics, Data Systems Division, Personnel Department, 12101 Woodcrest Executive Dr., Drawer 008, St. Louis, MO 63141.**

SYSTEMS/SOFTWARE PROFESSIONALS

SMS has the answers to your most frequently asked questions.

1. Is the applications/hardware environment advanced and diversified enough to provide long-term challenge, stimulation and growth?

SMS houses one of the nation's most sophisticated data centers. Our hardware configuration includes multiple IBM mainframes (3081s, 3033s, 4341s and others) and an array of supermini computers (VAX 11/780, 11/750, 11/730 and others). These systems support 6500 terminals nationwide and provide over 800 users with over 70 M.I.P.S of processing power. Within this environment, SMS professionals handle ongoing software development assignments for a broad range of technologies including networking, distributed processing and data base management systems used in data intensive health care environments.

2. Realistically, what are the opportunities for management and technical advancement?

Since 1969, SMS has been growing at an annual rate of 25%. Our growth alone has created exceptional opportunities for career development. Also our industry is changing. Our emphasis on managing information creates continued opportunities for people who can make difficult management and technical decisions.

3. How much autonomy should I expect?

At SMS the emphasis is on getting the job done. We know that technical professionals accomplish a lot more when they are given the freedom and support they need to do their best work.

4. Describe the work environment.

SMS's World Headquarters is situated on 116 acres in Malvern, PA (just 30 minutes from Center City Philadelphia) and incorporates our 82,000 square foot data center. Our campus-like setting offers plenty of space for outdoor activities and is uniquely conducive to accomplishment. And our location off of Route 202 places you in the middle of one of the nation's leading high tech centers.

5. Salary and benefits?

SMS's salaries are fully competitive with the leaders in the data processing industry. Our benefits package includes dental, tuition, stock purchase, and retirement/savings plans. Relocation assistance is available for eligible, experienced professionals.

VAX SYSTEMS DEVELOPMENT

Senior/Intermediate Level Technical & Management Openings

These positions present exceptional opportunities for Systems/Software Professionals to assume leadership positions in one of the world's largest, most advanced VAX systems development environments. Specific openings at SMS World Headquarters in Malvern, PA include, but are not limited to, the following:

Applications Development
Communications Systems Development
Performance Analysis
Sub-systems Development
Systems Architecture Development

Positions are also available for **IBM OS/COBOL Applications Development Programmers** to work with the latest CICS/DBMS technologies and on the development of advanced communication interfaces (including local area networks) between distributed DEC and large scale IBM host systems.

For consideration forward your resume to: SMS, Department CW-8CZ, 51 Valley Stream Parkway, Malvern, PA 19355. An equal opportunity employer.

HOW TO SAVE $30,000 PER MONTH ON A 3083 LEASE.

Lease the same 3083 that IBM leases for over $92,000 per month from Randolph—for less than $62,000 per month. That adds up to savings of $1,440,000 over a four-year lease period. If you're renting an older machine, Randolph may save you even more—and you'll get about four times the throughput in the bargain.

WHEN IS THE BEST TIME TO TALK TO RANDOLPH ABOUT LEASING A 3083?

Now—because Randolph has 3083's available for 4th quarter delivery. But it's never too late, even if you already have a machine installed. Whatever your situation, we can tailor a lease that will fit your exact needs and let you start saving money right away.

TALK TO RANDOLPH NOW.

We can solve problems like these, and more . . .
Stuck with a lease on your old machine?
We'll sublease it, and provide a new lease on a 3083.
Own a 3083 but need cash?
Sell your machine to Randolph, and we'll lease it back to you.
Machine installed on a rental basis?
We'll show you how to end the lease and install a new 3083. Any termination charges can be folded into your new Randolph 3083 lease.

LEASING COMPUTERS IS OUR ONLY BUSINESS.

At Randolph, our people have an average of 18 years in the DP industry . . . from 360's to 3081's. They know all about alternative financing to be sure, but they also know their way around a DP department and the hardware in it.

WE LEASE MORE THAN 3083's.

Whatever your needs, now is the time to talk to Randolph. We provide leases for IBM 303X, 4300 and 3081 systems and peripherals—disks, tapes—as well as 3083's.

UNIQUE FINANCIAL STABILITY.

We're an important part of one of the nation's oldest and leading financial institutions . . . The First National Bank of Boston. 19 years in computer leasing gives added assurance that Randolph will continue as the leader in the computer leasing industry . . . continue to live up to the terms and conditions of our agreements . . . provide upgrades . . . fulfill all of our commitments.

LET RANDOLPH HELP YOU SAVE $30,000 PER MONTH.

We can solve a lot of problems for you, and save you money, too. Talk to Randolph now . . . call Joseph B. Kelly, Jr., Executive Vice President, 800-243-5307.

BIDS & PROPOSALS

ATTENTION: COMPUTER HARDWARE MANUFACTURERS AND THIRD PARTY VENDORS

The New York City Human Resources Administration Department of Social Services is seeking proposals for the acquisition of computer hardware including a mainframe CPU and central site peripherals to replace existing equipment which will be traded in as part of the acquisition plan.

Proposals will be received by the Human Resources Administration Department of Social Services until 5:00 P.M., Tuesday, February 21, 1984.

A proposer's conference will be held at 10:00 A.M. on Tuesday, February 14, 1984 at 2 Broadway, 6th floor, New York City.

Request for proposals may be obtained beginning 9:00 A.M. on January 30, 1984 from the Office of Data Processing at 2 Broadway, 6th floor, room 6705, New York, New York 10004, Attention: Dennis Cribben (212) 376-6081.

AUCTIONS

"The undersigned will sell at Public Auction on Tuesday, January 31, 1984 at 10:00 A.M. (local time) our right, title and interest in and to the goods described as follows:

One (1) IBM computer system (CPU) model 5340-F37, serial #30080 with: (1) Printer, model 3262-5bl, serial #12214; (5) Unit groups (Displays #6251-11; Keyboards #4600 and cable groups #2665), serial nos. K7724, D1582, A6203, A6467 and 32643 with the following software packages:

(1) Address Book
(1) Inventory Management
(1) Sales Analysis
(1) Accounts Receivable
(1) Order Processing
(1) Accounts Payable

The auction will take place on the premises of Pickens Kane, 411 Halsted, Chicago, IL 60610.

The terms of the sale are a minimum down payment of 25% in either cash, certified or cashier's check at the time of sale with the balance due within 24 hours and the undersigned reserves the right to bid on said equipment.

CREDIT ALLIANCE CORPORATION"

SOFTWARE SERVICES

Associate Branch Manager

We are a national leader in IBM Software Consulting services. To meet the software needs of our rapidly growing marketplace, we are seeking additional associates, nationwide. Inquiries from experienced NIS executives, software related sales professionals and practicing independents are being considered.

If you are an accomplished individual now contemplating entrepreneurship as an avenue for greater success, we would like to hear from you. Our opportunity is success-proven and offers outstanding earnings potential. For consideration in your locality, please write detailing your experience or send resume to:

Box NBWC 5339

ORDER FORM

COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 451) should be clearly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $130.00 (One unit minimum and no fractional units allowed.) There are no agency commisions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

Date(s): _____

15 pointed questions to ask MSA or any software supplier

These questions will help you when you sit down with individual software companies.

They're tough questions. Relevant ones. And any supplier who is worth his salt should be able to answer them without backpedaling.

Ask MSA

We'll answer all these questions to your satisfaction—plus any others you may have.

In fact, we're probably the best equipped to answer them. Because MSA is the software company. We offer the most complete line of totally integrated systems in the software industry, including financial, human resource and manufacturing.

So you avoid the headache of trying to tie together individual systems. (And the even bigger headache of adding to them.)

With MSA's integrated systems, there's no unnecessary duplication of data or effort. Reporting is faster. All your company's information is more timely and accurate—and in the right form.

Our technical edge comes from experience

Staying ahead is easier for a company that's steeped in software technology. MSA has spent years developing, refining, testing and enhancing our systems.

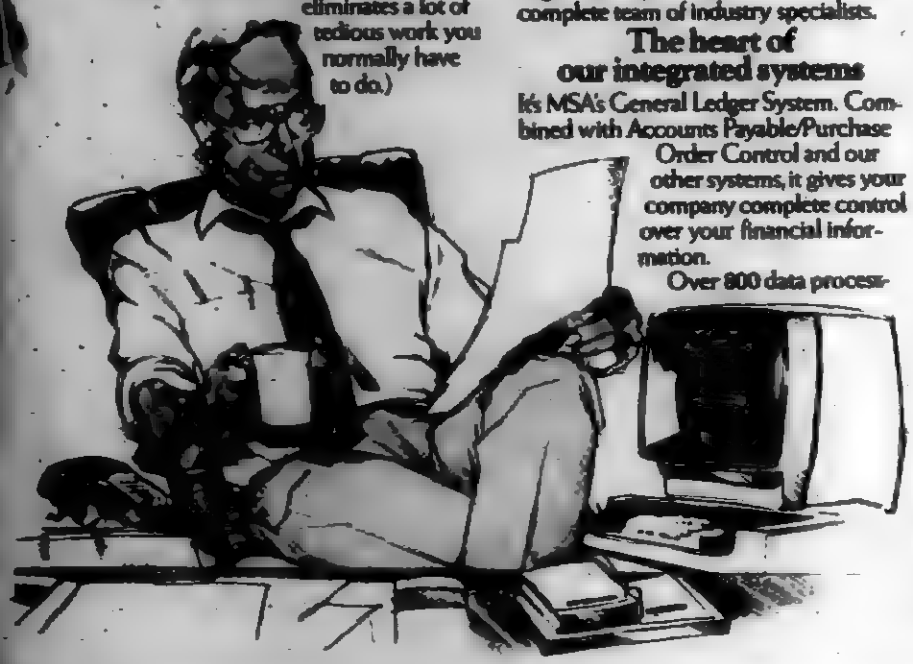
This year alone, we'll invest $25 million to make sure all our systems are technologically razor sharp. That gives us a decided advantage over flash-in-the-pan technology that may not have the bug-free logic of a more experienced system.

It also gives you a decided advantage over "custom" systems you have to update yourself.

MSA relieves you of that time-consuming burden. We update and enhance your software for a full year. Then we continue this service for a surprisingly low annual fee.

Maintenance includes keeping your system up-to-date technologically. Enhancing it with new features that make it work even harder for you.

And making sure it reflects changes in accounting procedures and government regulations, including 401(k), TEFRA, and FAS52. (That eliminates a lot of tedious work you normally have to do.)



Save this box. It can help you make an intelligent software decision.

1. Can you offer us a complete range of software systems designed to work together?
Or will we have to piece together a patchwork of systems?

2. Are your systems just record keepers, or can they really help us make decisions?
Can we pull together information from any of our integrated systems? In exactly the form we want it?

3. Can you provide business software for both mainframe and microcomputers?
Do you develop this software yourself or do you simply market it for another company?

4. Are your systems truly online so all of our information is current?
How many of your systems are online? How secure are they?

5. Will my company have to be the one that discovers the bugs in your brand new system?
Just how long have your systems actually been used, and how have they been tested?

6. Will you update your systems as technology advances and regulations change?
What are some of your most recent updates? Will you keep us current on regulatory changes?

7. Do your systems really do everything you say they will?
Or will we have to change them or add to them to get the features we want?

8. How long have you been in business?
What are your revenues? What is your growth record? Where will your company be five years from now?

9. How many systems has your company installed?
How many of these were installed in the past six months? How many of your earlier customers are still using —and liking—your systems?

10. Do your financial systems handle unlimited foreign currencies?
Do your financial systems use a common set of currency exchange rates?

11. Can you link our executives' computers directly to the mainframe—so they can get their own information?
Is that software available right now?

12. How will you make sure our own people thoroughly understand your system?
Do you have educational centers near us, or will we have to travel all the way across the country to find one? Will you be there to help during installation and after?

13. How many of your people specialize in software for my industry?
How many accountants work for you? Human resource specialists? Manufacturing experts?

14. Do your systems have built-in features that make them easier to use?
What happens if someone needs help figuring out a feature? Do you have online documentation that's easy to understand?

15. As my business changes will your system be flexible enough to change with it?
Or will we have to pay a lot to revamp it? Or even regenerate it?

35,000 days of training

At MSA, we make sure your people have a firm grasp of our systems. Last year alone, we conducted more than 35,000 student days of customer training for over 1,800 companies. At education centers all over the world, as well as at our headquarters.

From training sessions to cassettes to complete, easy-to-understand documentation, MSA provides the most extensive Customer Education Programs in the industry.

And MSA systems are just as friendly as our people. Our online HELP feature actually guides users through our systems, and EASY-SCREEN™ lets them design their own screens without creating data processing nightmares.

If there's ever a question or problem with our systems, MSA customers are always close to service.

Our Account Managers are knowledgeable, responsive, and backed by a complete team of industry specialists.

The heart of our integrated systems

It's MSA's General Ledger System. Combined with Accounts Payable/Purchase Order Control and our other systems, it gives your company complete control over your financial information.

Over 800 data processing specialists, accountants, and financial experts work together to make MSA's financial systems the most advanced and most highly integrated in the industry.

MSA has the answers

Whatever your size—whatever your business—MSA has a total software solution.

We'll provide the highest quality integrated online software.

We'll tie your business and manufacturing software systems together, using our exclusive Extended Closed Loop™ manufacturing system.

We'll provide business software for your microcomputers, through our Peachtree Software Company.

We'll even link your microcomputers to your company's mainframe—with MSA's Executive Peachpak™ application software. A revolutionary concept that lets executives get the mainframe information they need through their personal computers.

Ungermann-Bass adds fiber-optic local net

By Lynn Haber
CW Staff

WASHINGTON, D.C. — In a move to cover all bases in the local-area network arena, Ungermann-Bass, Inc. took the wraps off a fiber-optic, Ethernet-compatible local-area network at last week's Communication Networks Conference & Exposition here.

The result of a joint marketing agreement with Siecor Corp., maker of Siecor Fiberlan, a fiber-optic transmission subsystem, Fiber Optic Net/One is an expansion of Ungermann-Bass' existing baseband and broadband systems. It was designed to bring to local-area networks such fiber-optic features as noise immunity, secure transmission and the ability to communicate over longer distances.

With the addition of an optical fiber local-area network to its product line, Ungermann-Bass is effectively allowing users to select the medium or combination of media most appropriate to their application, a spokesman claimed. By using either network bridges or repeaters, users can interconnect baseband, broadband and optical-fiber Net/One systems, he said.

Targeted primarily at users who want to extend the transmission range of an installed, coaxial, carrier-sense multiple access with collision detection local network or users who need to install a network that provides high reliability under adverse environmental conditions, Fiber Optic Net/One is available in single- or multiple-cable configurations and operates at a 10M bit/sec data rate.

Net/One network interface units use electro-optical transceivers to provide the transmission interface to the optical fiber medium, the vendor said. This interface reportedly meets the specifications of Xerox Corp.'s Ethernet and employs access methods and collision detection signals functionally identical to those used

Satellite service set by Hewlett-Packard

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — Hewlett-Packard Co. and Vitalink Communications Corp. last week announced a satellite-based voice/data private network service priced substantially below competing terrestrial microwave facilities. The joint venture marks the entrance of processor maker HP into the increasingly competitive telecommunications market.

The satellite service, available immediately, allows HP 3000 users to bypass the telephone network and communicate with each other through earth stations supplied by Vitalink and satellite channels provided by Western Union, Inc.'s Westar IV satellite. The software needed to interface the HP 3000s to the Vitalink earth stations has already been developed, according to a Vitalink press release issued here last week at the Communication Networks Conference & Exposition.

An HP spokesman noted that because the HP 3000 can emulate IBM processors, users of IBM mainframes can also transmit voice and data over the satellite network.

The network will provide a two-way 56K bit/sec channel for $1,500/mo, according to George Ward, president of Vitalink, a three-year-old company partly owned by Western Union and General Electric Co. "The conventional microwave link used for this purpose typically costs $8,000 to $9,000 a month," Ward noted.

However, there will be some additional charges. The user must either buy an earth station costing $120,000 per site or lease one for $2,000/mo. There is also a one-time charge of $20,000 for the HP interfacing software.

HP representatives will be the user's initial point of contact for the satellite service; they will sell and lease the Vitalink facilities

High-tech Robin Hood pays piper

By John Gallant
CW Staff

OLYMPIA, Wash. — When it came time for Stanley Syngsted to order up a round of beers at Charlie's Tavern here, he always outdid the other patrons by buying the quart-size bottles.

Syngsted liked attention, said bar manager Jim Silva, and he always had lots of money to spend and to loan to other customers who were down on their luck. Unfortunately, the money wasn't his.

State police said that between April 1982 and March 1983, Syngsted, an information supervisor for the state's Department of Social and Health Services, used the agency's Sperry Corp. Model 1100/82 mainframe to issue himself some $17,000 in fraudulent payments.

State Police Lt. Ed Crawford said the Olympia native designed the computer program that issued the funds. According to Crawford, Syngsted had the checks made out to one Stanley Lyngsted at his home address — the missing letter in his surname designed to throw auditors off the trail.

Crawford said Syngsted was thorough about destroying computerized evidence of his wrongdoing, but he overlooked the canceled checks, which investigators seized upon as evidence.

Syngsted was arrested and pleaded guilty to first-degree theft. But he claimed he had given all the stolen money to the broke and unemployed patrons of Charlie's Tavern.

Instantly, bartender Silva said, the media seized on Syngsted as "a Robin Hood of the computer age." The tavern was besieged by writers from local and national newspapers and by television crews, including ABC and NBC.

At his sentencing last July, Syngsted told Thurston County Superior Court Judge Hewitt Henry that he could "fill the courtroom" with the people who had benefited from his ill-gotten gains. The judge was not impressed. Telling reporters he was not at all pleased at playing the role of Sheriff of Nottingham, Henry sentenced Syngsted to the maximum 10 years in prison.

Speaking last week from the Cedar Creek Corrections Center in Little Rock, Ark., Syngsted said he decided to finagle with the state computer only when his own funds

STC drops mainframe plans, cites tech, cost problems

By Peter Bernelli
CW Staff

LOUISVILLE, Colo. — Storage Technology Corp. (STC) has terminated a project to produce and market an IBM-compatible mainframe computer because of technological problems and increasing cost estimates.

The Jan. 26 announcement that STC is ending work on a mainframe that, in the words of a company spokesman, proved to be "not a complete computer" was the second time in 16 months STC abandoned major hardware development efforts it had planned to expand its product line beyond storage systems.

The mainframe project was announced three years ago [CW, Jan. 19, 1981] under joint agreement with the newly formed Storage Technology Partners, with planned shipments in early 1984 of a high-range mainframe using Cmos technology, with expected performance rates of three million to 14 million instructions per second. Reportedly, some $70 million had been raised since then to fund the effort.

The recent announcement marks the second failure by the mass storage producer to extend its product line into the processor field. Less than two years ago, STC announced it had abandoned development of the Virtual Storage System (VSS), a back-end processor, or data base machine, that had been announced one year earlier [CW, Aug. 9, 1982].

Kenneth Bosomworth, industry analyst and president of International Resource Development, Inc., told *Computerworld* that STC's mainframe development program may have stemmed from overconfidence resulting from the company's broad market penetration with magnetic storage products.

"Probably, [STC] should not have gone into [mainframes] to begin with," Bosomworth said. "I think they were tempted into it because they have such good customer accounts [with] monthly billings in the hundreds of thousands and even millions of dollars. They probably figured, why not produce mainframes as well and take IBM out [of those accounts] completely?

"It must have been tempting from the market-access standpoint."

Bosomworth added that development of both the mainframe and the earlier VSS may have diverted resources that could have been put to better use. "You only have a limited amount of engineering talent and resources to spread around," he said, adding that STC may have been better off "protecting their strong areas in magnetic storage and, perhaps, optical storage."

In a brief statement announcing the end of the mainframe development effort, Jesse I. Aweida, chairman of STC, said the termination was unavoidable. "Delays in completing the development program have reduced the likelihood of successfully marketing the mainframe computer," Aweida said. Continuation of the project would have risked further delays and called for substantial additional funds, he added.

STC Vice-President Ronald B. Weinel told *Computerworld* a number of factors went into the decision to cancel the project. In particular, recent tests showed "the computer was functioning and performing complex tasks, but was not a complete computer." He said 15% to 20% of the mainframe's very large-scale integration chips "were not performing" up to expectations.

The company had only recently informed the 200 to 300 investors in Storage Technology Partners that the expected shipment date of the mainframe had been put back to late 1984, Weinel said.

He added that STC management felt "the potential for successfully marketing the product was slipping" and expected costs to complete the project were significant. Asked if IBM's aggressive pricing and product announcement strategies were a factor, he replied, "We anticipated that the longer it took us to [produce the mainframe], the more we would be in direct competition with them."

Weinel would not comment on whether the company plans in the future to concentrate on storage technology or to try again to expand its product line into other areas.

The company, which has experienced losses for two straight financial quarters, said the canceled project should produce a substantial write-off in the fourth quarter and "add to the losses from ongoing operations expected for that quarter."

STC expects to terminate 400 employees who had been involved in the project. Weinel said that despite layoffs of 400 in October 1982 and 500 in March 1983, employment levels had just about climbed all the way back up before the announcement.

Microdata workstation features limited AI

By Jeffry Beeler
CW West Coast Bureau

LOS ANGELES — Microdata Corp. last week extended its product line downward with the introduction of an intelligent workstation that reportedly provides limited artificial intelligence and allows computing novices to communicate with central processors in a nontechnical vocabulary.

The Microdata 1000 was designed to operate either in stand-alone mode or as a terminal linked to an IBM or Microdata host computer. The workstation is packaged with Natural Language, an inquiry-processing software module that enables the workstation to "learn" new user words or commands as it discovers them, according to a Microdata spokesman.

For example, if the 1000 encounters a word not previously included in its data dictionary, a definition is requested, and the response is used to update its lexicon. When it encounters the same word again, the workstation grasps the meaning immediately, the spokesman said.

Natural Language also allows the 1000 to draw logical inferences from incomplete or unclear user inquiries and to adapt itself automatically to differing styles of personal expression. If, for example, a query is only partially decipherable, the product interprets the command as best it can and then asks if its interpretation is correct, the spokesman said.

Natural Language interfaces users to the relational data base management system already residing in the 1000's Micro-Reality software, a previously unavailable subset of Microdata's existing Reality control program.

Micro-Reality is bundled in the 1000 with two other operating systems: Convergent Technologies, Inc.'s Ctos and Microsoft, Inc.'s MS-DOS. Ctos allows the workstation to run a family of Convergent-developed applications, while MS-DOS enables the machine to support Microsoft's Multiplan spreadsheet package.

All the Convergent-written programs are decision support tools for office automation and allow the workstation to perform applications like word processing, business graphics, electronic mail and project-scheduling tasks.

With the introduction of the 1000, Microdata's product line now consists of four software-compatible systems capable of supporting one to 208 concurrent users. The other three members of the company's product family include the Reality small business system, the Sovereign distributed processing system and the Sequel 32-bit large business system.

Works as stand-alone or terminal

Built around Convergent Technologies' Ngen intelligent workstations, the 1000 can operate either as a stand-alone unit or as a system terminal linked to an IBM mainframe or to a larger Microdata processor. To permit communications with IBM CPUs, the Microdata product optionally supports the 3270 bisynchronous transmission protocol or can operate in a Systems Network Architecture environment, the spokesman said.

The 1000 also can be interconnected with up to three other Microdata workstations to form a local network in which all constituent terminals can share hard disk storage, printers or similar systems resources.

In a typical local network, one of the nodes acts as a master and is equipped with at least one 10M- or 20M-byte hard disk unit. The other three workstations, meanwhile, serve as satellites and support 5¼-in. floppy disk modules, each holding up to 630K bytes.

With its Intel Corp. 80186 microprocessor, the 1000 operates at 8 MHz, three times faster than the IBM Personal Computer, Microdata claimed. It incorporates a bit-mapped display with 720- by 348-pixel resolution, quadrupling the pixel density of the Big Blue product. The workstation also holds up to 1M byte of main memory and as many as four 10M- or 20M-byte hard disk units, for a total external storage capacity of 80M bytes.

In a basic configuration, a master Microdata workstation, designated the 1000/40, incorporates a 12-in. display, 512K bytes of main memory, three operating systems and a 10M-byte disk unit.

The 1000/40 costs $8,075. With the hard disk excluded, the system becomes a satellite 1000/10 configuration, which costs approximately $4,000.

Both workstation versions will be available for shipment during the first quarter from Microdata at 17481 Red Hill Ave., Irvine, Calif. 92714.

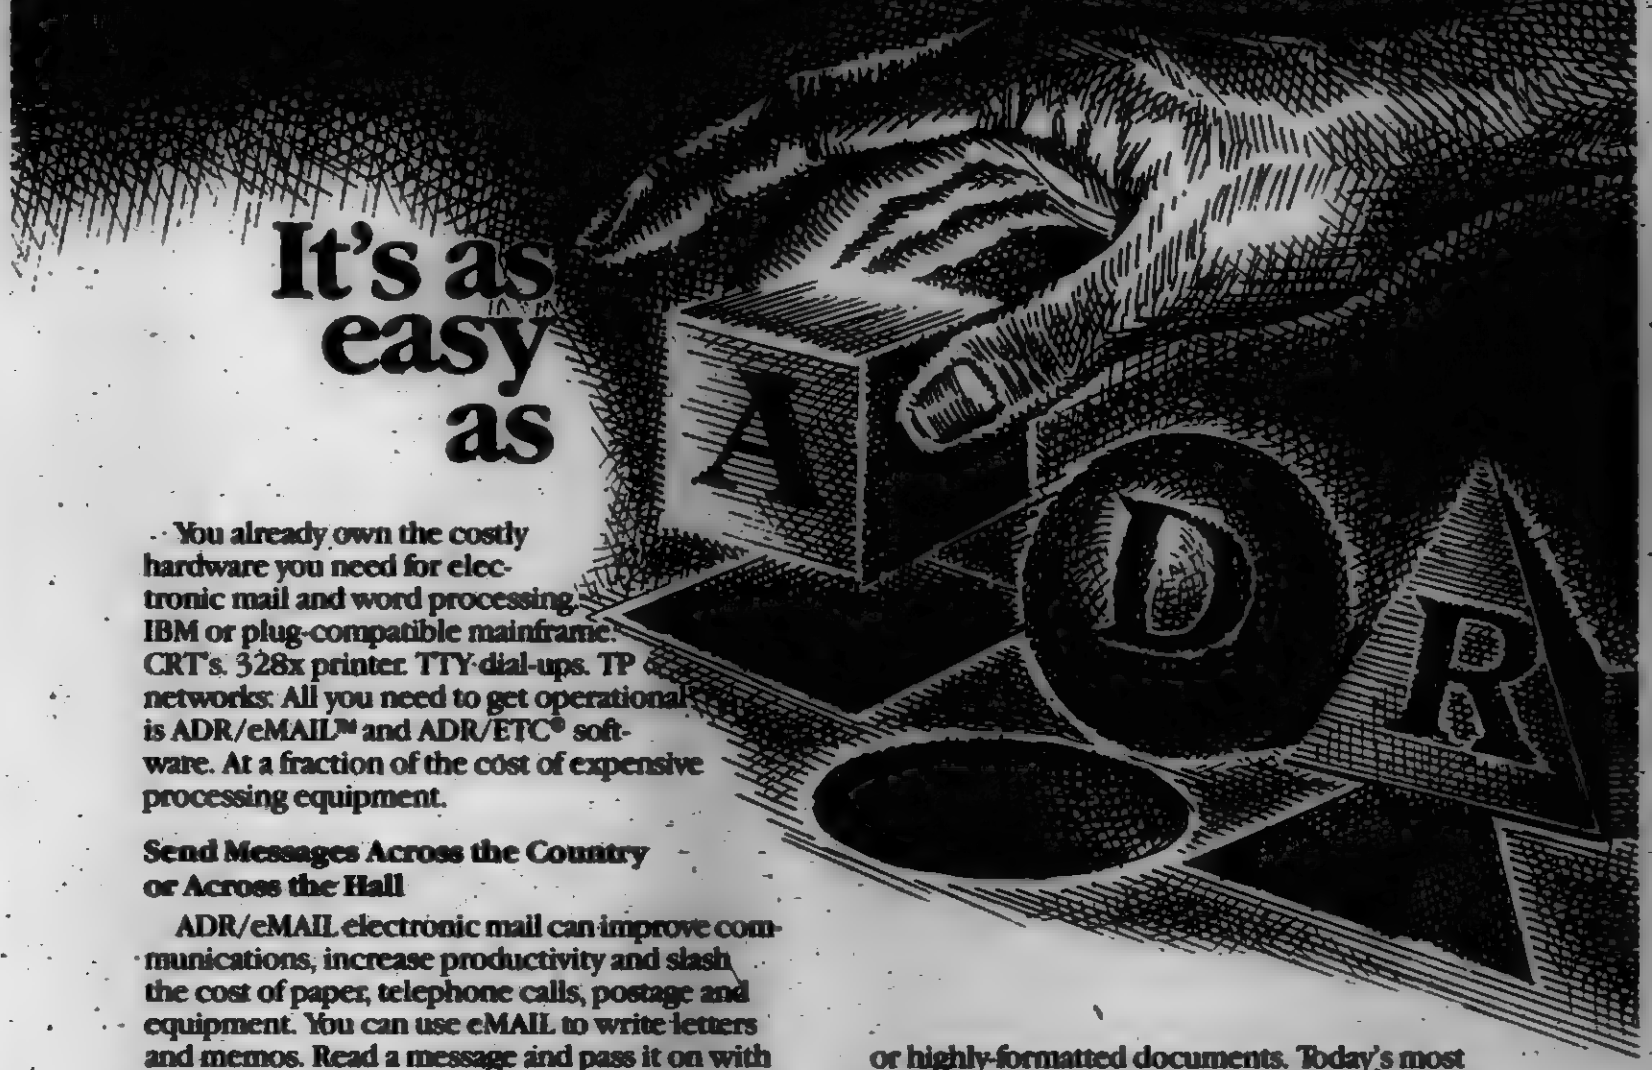
OFFICE AUTOMATION

Electronic Mail and Word Processing



It's as easy as

You already own the costly hardware you need for electronic mail and word processing. IBM or plug-compatible mainframe. CRT's. 328x printer. TTY-dial-ups. TP networks. All you need to get operational is ADR/eMAIL™ and ADR/ETC® software. At a fraction of the cost of expensive processing equipment.

Send Messages Across the Country or Across the Hall

ADR/eMAIL electronic mail can improve communications, increase productivity and slash the cost of paper, telephone calls, postage and equipment. You can use eMAIL to write letters and memos. Read a message and pass it on with comments. Keep copies permanently. Send a message to a person, group or department. eMAIL can be accessed from any location in its terminal network – not just from your regular office. With eMAIL, you can't misplace, forget about, or spill coffee on, your mail. You can actually handle all your mail in only 15 or 20 minutes a day. Best of all; ADR/eMAIL is simple to learn – anyone can use it.

ADR/eMAIL is Integrated With ADR/ETC Word Processing

eMAIL includes an interface to the ADR/ETC word processor for sending and receiving large or highly-formatted documents. Today's most versatile and powerful word processor, ETC lets you generate simple memos, extensive proposals, catalogs, manuals and one or 100,000 personalized letters. It even allows you to link your word processing activities to your data processing systems. ETC also interfaces with typewriter terminals and hardcopy printers for boardroom quality documents.

ADR® is Ready When You Are

Call or write for more information on how you can increase office productivity, boost employee morale and cut costs substantially. It's as easy as A D R.

APPLIED DATA RESEARCH

The one vendor software solution

Cost of Cobol generator pays off for small user

By Paul Gillin
CW Staff

TAMPA, Fla. — For a small programming installation like that at Duval-Bibb Co. here, a $30,000 investment in a programmer productivity tool is a major expense. But the magazine distributor's DP department decided the expense was worth it after estimating that the tool would increase productivity by the equivalent of two to three staff members.

Duval-Bibb became one of the first users of Computer-Aided Programming (CAP), an intelligent code generator from Netron, Inc. of Toronto that runs on Wang Laboratories, Inc. machines. CAP employs reusable Cobol code and a functional programming concept called a "frame" to incorporate separately compiled and linked subroutines and customized code to significantly cut down on the time required to develop applications.

> *'It's very fast. . . . In the past we've budgeted five days for a reasonably sized report program, including design, test and documentation. With CAP, the coding and testing portion virtually disappeared. Three days worth of work collapses to less than half a day.'* — Leslie Feasey, manager of information systems at Duval-Bibb Co.

CAP uses a fill-in-the-blanks approach and a sophisticated full screen editor that enables programmers to avoid much of the mundane coding that is required to generate routine applications, according to DP staff members at Duval-Bibb. The product also allows programmers to break out of the frame to add custom code where needed. Users can design their own frames and save common subroutines for future use.

Used in all development

At Duval-Bibb, CAP was installed on a Wang VS90 last spring and is now used in all new development, according to Leslie Feasey, manager of information systems. In addition, the software is used extensively to regenerate modules of code that are scheduled for routine updates and maintenance.

In one case, programmers regenerated an entire application using CAP after they figured it would take only 1¼ days longer than the 26¼ days scheduled for updating the program. The program, a data-entry application that updates six files at once, "is one of the real nasties in the library," Feasey said.

In addition, the staff has developed two major projects using CAP, which together incorporate nearly 20,000 lines of code. CAP is best for standard programs like report generation, data entry and file management, Feasey said.

"It's very fast," he commented. "In the past we've budgeted five days for a reasonably sized report program, including design, test and documentation. With CAP, the coding and testing portion virtually disappeared. Three days worth of work collapses to less than half a day."

Creating a standard report involves writing "very little code," according to Rick Deland, a programmer/analyst. "The main thing you do is go into the report description, lay out the report as you'd like to see it, define the screens, and that compiles into a frame. Then you change a few parameters and it compiles," he maintained.

Because CAP uses pretested, canned subroutines, applications are easy to modify, Feasey noted. "You just put a break in a routine, write the code and recompile," he said. "It adds most of the hooks."

For Duval-Bibb programmers, the CAP full screen editor is the product's most useful feature. Using a scrolling feature, the editor can accommodate screens of up to 100 lines, can edit a screen at a time and can display all error messages at once, Deland said. "It allows you to display a file or run a program while you're still editing a file," Deland said. "You can also tell it in what order you want fields to be edited."

CAP has also reduced the need to write working storage code. "In the past, a pretty complicated report program involved laying out a lot of working storage," Deland said. "In CAP, the working storage that relates to the file is done for you. You're not involved with working storage in most cases."

The screen editor is "head and shoulders above the Wang editor," said Fred Mortimer, a senior analyst. "You can lay out and modify a screen in 10 to 15 minutes."

The CAP environment section presents multiple directories on a single screen. A programmer can call up a screen by positioning the cursor next to the screen name and can use up to 32 programmed function keys to make standard changes. "We've been able to go in and rearrange an 18-column report in less than a day," Mortimer said. "Any screen generating I've done in the last six months, I've done with CAP."

Some reservations

Programmers noted that CAP is still not appropriate for most large applications. "It has real trouble with update programs," Deland said. "You still have to write about 90% of the code from scratch."

"In the real heavy computational program," Feasey added, "you end up writing most of the code by hand. You only save 20% to 30% of the time."

Staff members also pointed out that while a programmer can be productive on CAP after only three days of training, proficiency takes a good deal longer to achieve. "It's easy to get started, but even after six months you're still learning," Feasey said. "Learning it thoroughly is fairly complicated."

Execs: 3270-PC won't displace 3270 terminal

By Paul Kwasnicwski
CW Staff

Will IBM's 3270 Personal Computer render obsolete its own 3270 series of terminals? The answer to that question is "probably not," based on recent *Computerworld* interviews with DP managers and industry analysts who believe functional limitations and cost will prevent corporations from replacing 3270 series terminals with 3270-PCs.

"When the 3270-PC was introduced, I thought it would provide the mainframe link that corporate users desired," said Ron Goldfarb, manager for office automation at Pratt & Whitney Aircraft Co., based in Hartford, Conn. The microcomputer apparently did not fufill this need: "A user can access mainframe data, but it isn't easy to use that data with Lotus Development Corp.'s 1-2-3 or other microcomputer applications [software]."

The problem is caused by the incompatibility of mainframe and microcomputer data formats. IBM mainframes store data in Ebcdic format; Personal Computers use Ascii format.

Converting mainframe data for microcomputer applications is a tedious process. A user who wants to do so needs the proper software and temperament. First, he must load and run one of the micro-to-mainframe links which reformat data in one of the seven windows available on the 3270-PC. (Visicorp's Visianswer, Management Science America, Inc.'s Peachlink and McCormack & Dodge Corp.'s PC Link are three products that provide this type of link.) Next, the user must store the reformatted data on the microcomputer note pad icon which is used to transfer data between applications running in different windows. After he has utilized the data in the appropriate applications, he has to reverse these steps to send the file to the mainframe.

Windowing capability

The 3270-PC can load microcomputer software in seven windows, four of which can be used for mainframe applications. It is this windowing capability that separates 3270-PCs from 3270 terminals — a distinction for which users pay dearly, according to Dale Kutnick, executive director at The Yankee Group, the Boston-based market research firm.

"IBM would be happy if everyone replaced 3270 series terminals with 3270-PCs," Kutnick said. "The 3270-PC costs approximately three times as much as a 3178, the least expensive 3270 series terminal. Since terminals are used primarily for data entry, window capabilities are really not needed. [Data entry] department managers could not justify the cost of the 3270-PC."

Higher costs do not stop with the stand-alone system. "Since the 3270-PC does not have multiplexer capabilities, it needs its own line to communicate with the host," Kutnick pointed out. "Communication costs would rise significantly if one replaced terminals with these microcomputers."

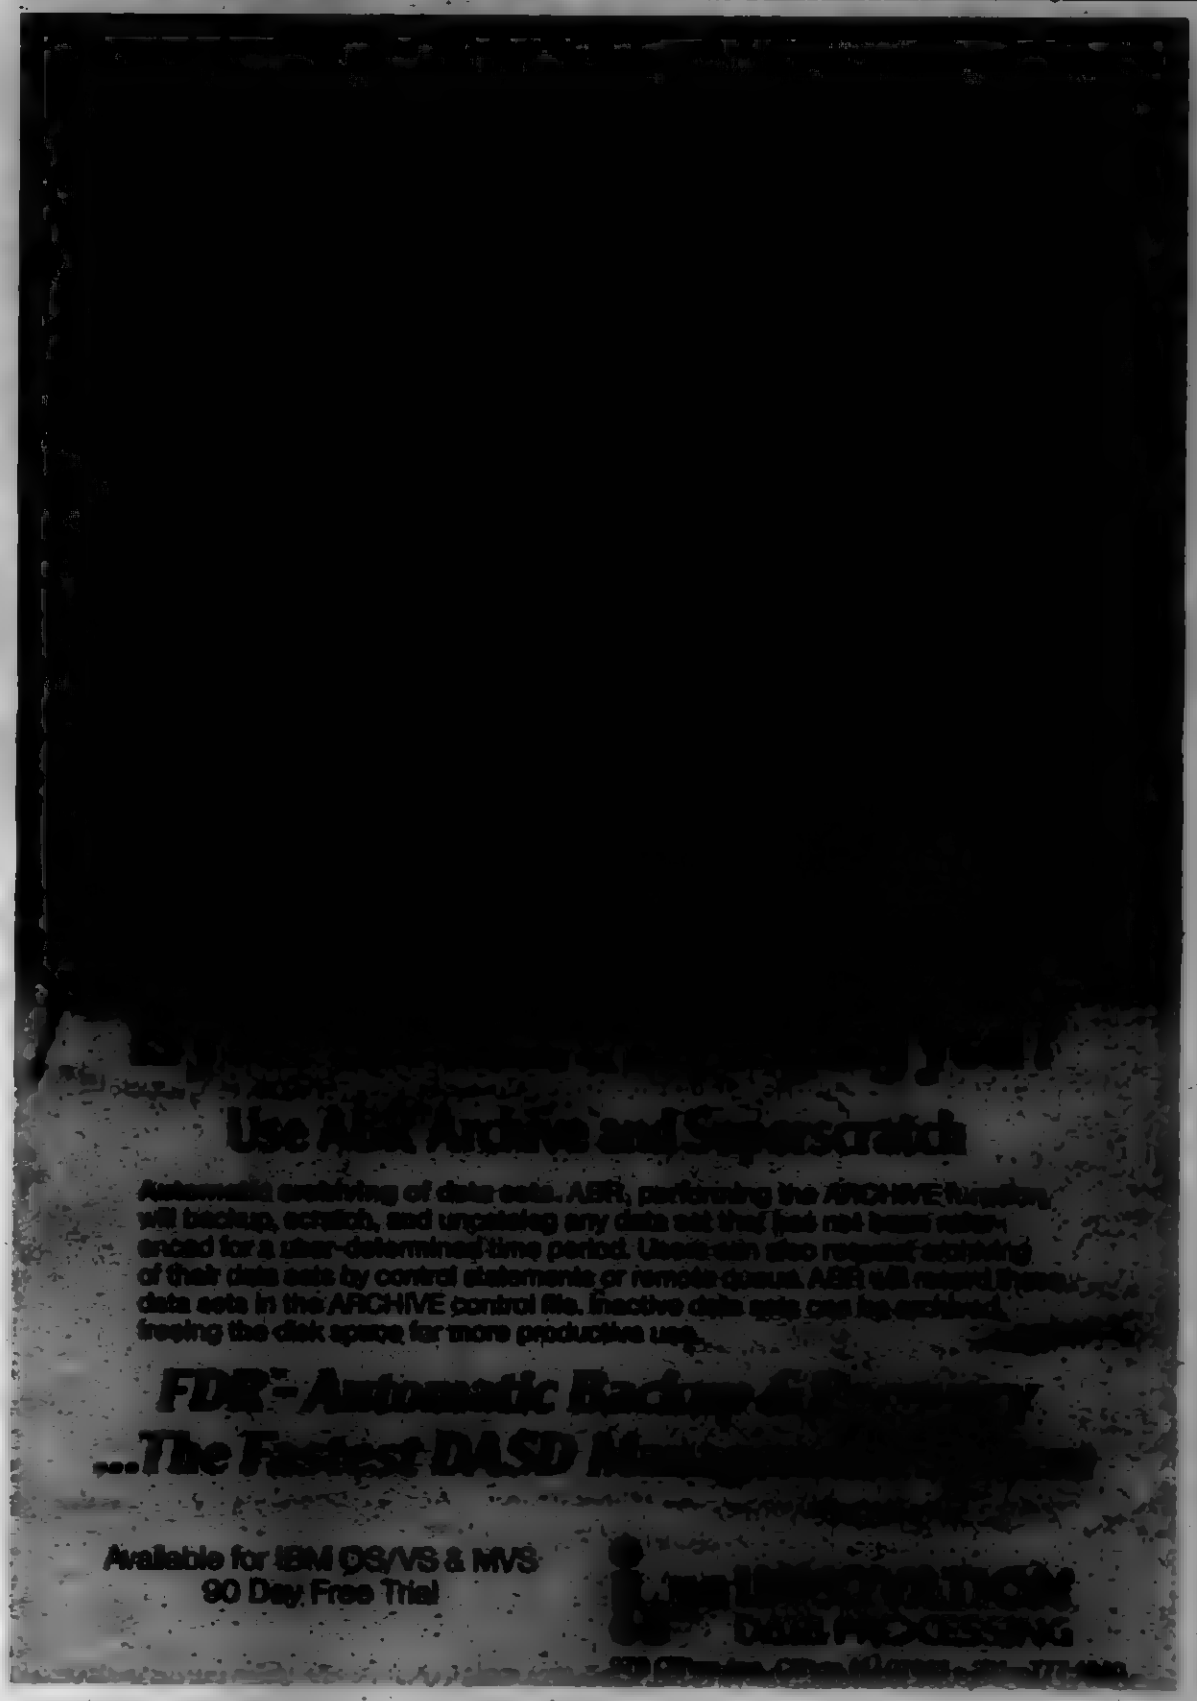
While the 3270-PC does not offer financial benefits to data processing managers, it will help IBM's bottom line. The 3270-PC represents Big Blue's latest attempt to protect what it perceives as its turf — data processing departments in large corporations. "IBM is tightening its open architecture, so it can have more control over the market," said Will Zachmann, vice-president of corporate research for International Data Corp., a market research firm in Framingham, Mass. "The 3270-PC is not aimed at the terminal market but at those trying to sell to the IBM corporate marketplace."

The micro, industry analysts say, was designed to keep computer retailers away from IBM accounts. Retailers like Entre Computer Centers, Inc. and Computerland Corp. packaged non-IBM products, such as terminal emulator boards, with IBM Personal Computers and called on IBM accounts that wanted a mainframe link. Since the retailer — not the IBM sales representative — could provide it, retailers sold huge quantities of IBM Personal Computers to IBM mainframe installations.

IBM kicked up its heels, limiting 3270-PC sales to its account representatives and designing the new system in such a way that upgrading from an IBM Personal Computer to a 3270-PC is not realistic. "IBM's rationale is that a mainframe link requires more than just a microcomputer," Kutnick said. "It requires communications capability, software and system-specific items. Its sales force understands those needs."

Because of its high cost and limited functionality, analysts predict small numbers of sales for the 3270-Personal Computer.

However, industry observers do predict continued growth in the 3270 series terminal market. "The 3270-PC does not mean the death of 3270 series terminals," Kutnick said. "There is a need for data entry functions. It is a viable market."



White House seeks jump in R&D but cuts for NBS

By John Gallant
CW Washington Bureau

WASHINGTON, D.C. — The Reagan administration asked for a 14% increase in federal research and development support in the fiscal 1985 federal budget sent to Congress last week. Total R&D funding would reach $63 billion, a $6 billion increase over this year's request.

The budget document emphasized a "high priority" for "R&D that is appropriate for federal support." In contrast, the administration continues to seek cuts in programs it wants the private sector to support, particularly the National Bureau of Standards' (NBS) Institute for Computer Sciences and Technology (ICST), whose funding would be cut 50% to $5 million under the Reagan plan.

Currently financed at approximately $10 million a year, the ICST program includes monies for the federal DP standards program and several computer research projects. It is the standards program the administration has sought to thrust onto the private sector. Congressional opposition, however, has so far kept this program within NBS.

In the overall 1985 Reagan budget, totaling $925 billion, support for basic R&D would increase 10% from $7.2 billion to $7.9 billion, which the White House estimated would equal a real growth above inflation of about 6%.

The $63 billion requested for total R&D funds emphasizes Defense Department programs and the programs of the National Science Foundation (NSF). NSF is tasked with strengthening engineering research and training and providing better access for scientists to advanced computer facilities.

Funds for NSF-supported R&D programs would rise by about $170 million, or 14%, to more than $1.4 billion in 1985. These funds are primarily aimed at supporting research in academic institutions through project grants emphasizing, among other things, engineering and better university research instrumentation.

The administration said it will provide special funds to increase access of academic scientists to supercomputers, providing not only computer time and technical support but also support for communications, equipment and other costs for remote access by scientists at their university laboratories.

Specifically, the NSF mathematical and physical sciences program, which includes access to computing facilities and research in computer science, such as new computing methods based on parallel processing and new mathematical structures and techniques, would receive $417 million in 1985, up from $359 million this year.

The NSF engineering program, which supports work to increase U.S. capabilities in such areas as computer and systems engineering, would be financed at $147 million, up from $121 million in 1984, under the Reagan budget. The bulk of federal R&D funds are slated for Defense Department programs, which include a number of programs in computers, semiconductors and electronics. Defense R&D funds will total $33.9 billion in 1985, a $6.2 billion, or 23%, increase.

Chemnet may be marketed

By David Myers
CW New York Bureau

NEW YORK — Chemical Bank may change from user to vendor by offering its telecommunications network capabilities to the merchant market later this year.

James Mayer, senior vice-president of telecommunications, confirmed last week that the bank is studying the possibility, but said a decision is in "the discussion stages" and still "months away." Yet to be answered are questions of security, product quality and regulation, he said.

If Chemical Bank does decide to plunge into the networking mart, it could provide electronic mail and applications-level capabilities with access to any of the distributed nodes on its already installed Chemnet, according to Mayer. This could ultimately mean an entrance by the bank into the time-sharing business.

Chemnet, planned three years ago, was completed for internal use in mid-1983 and incorporates a network architecture that in some cases was ahead of what IBM, Digital Equipment Corp. and Wang Laboratories, Inc. were able to offer it, Mayer said.

"We've worked along with the vendors and replaced the household stuff as soon as products were ready. Our approach is to standardize. That's what . . . makes the [network] product marketable," Mayer said.

Sperry posts earnings increase

NEW YORK — Citing improved earnings in each of its operating units, Sperry Corp. last week posted an 84% increase in earnings on a modest 1% jump in sales for its third quarter.

Profits totaled $74 million, or $1.42 per share, compared with $40 million, or 90 cents per share, the same period a year ago. Sales totaled $1.8 billion compared with $1.7 billion a year ago.

Sperry attributed its earnings jump to increased sales volume in its defense and aerospace operations, lower interest expenses and "continuing cost-cutting measures throughout the company."

For MIS execs, data base details micro software

By Jeffry Dexter
CW West Coast Bureau

WALNUT CREEK, Calif. — A marketing services firm has applied high technology to one of MIS management's newest but most vexing problems — the rapidly growing volume of end-user requests for information about microcomputer software packages. What it has come up with is a nationwide telemarketing service that provides on-line access to a central data base that reportedly describes thousands of personal computer programs.

Targeted mainly at business users in large corporations, the data base contains reviews, evaluations and general descriptions of each of the products listed in its software catalog. Also included with each item in the One Point Electronic Catalog is information about pricing, warranties, support and maintenance, according to Stevan Cloudtree, president of privately held ITM, the service's founder.

To gain access to the data base, a user dials ITM's phone number through a local modem and enters a password with his terminal keyboard; the user can either browse through the data base contents or conduct structured searches for specific kinds of packages.

"Each product in the electronic catalog is coded with up to 10 subject identification codes, much like a library's Dewey Decimal system," Cloudtree said. "So a user can search the data base by product name or publisher. In addition, if a subscriber wants, for example, an MRP program that interfaces with a particular accounts payable package and runs on a [Texas Instruments, Inc.] machine, he can string codes together to structure the search for exactly what he wants."

If a user finds a package that meets his needs, he can flag the appropriate item in the data base, enter his address and other shipment information and order the product. After paying a one-time setup fee of $100, the customer will receive a copy of the requested program through the mail within a few days, Cloudtree said.

Because it has its own source of supply and ships software in large volumes, ITM can typically make its products available to subscribers for discounts ranging from 20% to 30% or more, he added.

Since it went into operation in mid-December, the One Point service has already attracted roughly 200 subscribers, many of them large corporations like Pepsico, Inc. and Exxon Office Systems Co., Cloudtree said. Information systems managers reportedly account for an estimated 40% of the electronic catalog's total user base.

"What we're finding in our market studies is that MIS managers are being inundated with requests to research software packages and advise users about which microcomputer program they should buy," Cloudtree said. With One Point, they can quickly gather large amounts of information about many competing packages and then narrow the range of options down to four or five finalists. A key advantage of ITM's electronic catalog is that it can be easily operated by technically unskilled employees.

Echoing Cloudtree's comments about One Point is one of the service's users, Joe Nicholson, who recently left the New York-based software and consulting firm of Monchick-Weber Corp. to form Belvedere Microsystems, Inc. As a Monchick-Weber consultant, Nicholson found the electronic catalog "extremely valuable," primarily because of the extensiveness of the service's product data base.

"One Point gave us the opportunity to examine many software packages in a single source and find out what's currently available on the marketplace," Nicholson recalled. "We could never have learned about such a wide variety of products from computer stores, which usually offer only one choice of each type of package."

Based on a Compupro Systems, Inc. 816 microcomputer running Digital Research, Inc.'s MP/M operating system, One Point's data base currently lists some 3,500 packages, including the best known spreadsheet, word processing, graphics and other business-oriented microcomputer programs. An additional 1,260 titles are scheduled to be added to the catalog within the next 30 days or so.

CORRECTIONS

"DEC unwraps Ultrix-32" [CW, Jan. 23], which stated that Digital Equipment Corp. was the second major firm to introduce a Unix-based operating system, should have stated that DEC was the second major firm in recent weeks to introduce a Unix-based operating system. Several other major vendors have announced versions of Unix.

"Ingres update offered" [CW, Jan. 9] incorrectly stated the version number of the new release of Relational Technology, Inc.'s Ingres data base management system. The correct release is Version 2.1.

The last line of the address of the Mumps Users Group was inadvertently omitted from an article in the Jan. 23 Software and Services section. The full address is Suite 308, 4321 Hartwick Road, College Park, Md. 20740.

The correct price of Caleshare, Inc.'s CSI-X.25 Data Concentrator [CW, Dec. 12] ranges from $2,735 to $4,195 for four- to 16-port configurations.

CGA Software Products Group, Inc.'s Single Image Software Version 7.1 is an enhanced version of the software that is now available for IBM MVS/XA, not a new product as indicated in "Utility Offered for MVS/XA" [CW, Dec. 26-Jan. 2]. Also, the correct lease prices are $675/mo per site for Multiple Systems Integrity Facility; $450/mo each for Multiple Systems Manager and Global Console Director; and $1,575/mo per site for the three together, known as Single Image Software.

LONE EAGLE

SyncSort CMS:
It's a species all by itself!

(The only high-tech sort for VM/CMS.)

Call (201) 568-9700.

Liberate your sorts and your programmers.

What is that soaring so effortlessly up there in the data-processing heavens? Is it a bird? Is it a plane? Is it a man?

Nope, it's a Supersort – SyncSort CMS. And it does for VM/CMS what other versions of SyncSort have done for OS/VS and DOS/VS(E).

A couple of years ago there was no such animal as a high-performance sort program for VM/CMS. As a result, certain kinds of processing were just plain impossible with the system. It's a miracle that VM/CMS survived at all.

Then SyncSort CMS was hatched. It was the first and only sort program designed exclusively for VM/CMS. And it gave leading-edge processors a powerful tool for liberating the potentialities of their system.

In a little over a year, SyncSort CMS has acquired over 350 users. It's growing at a faster rate than either SyncSort OS or DOS were at a similar stage in their development. Here are some of the reasons for that astonishing growth:

1. SOARING PERFORMANCE. SyncSort CMS includes many of the technical breakthroughs we pioneered in OS and DOS sorting – innovations that are now patented.

The best way to find out what this revolutionary new sort program can do for you is simply to try it. You'll be amazed at how little VTime, TTime, Elapsed Time and SIOs it requires. You'll note a sharp drop in response times and a surprising increase in system throughput.

2. FINE-FEATHERED FEATURES. SyncSort CMS liberates programmers. Using the program's full range of features, you can often produce a simple report in one day rather than five. These can do the following:

- Select relevant records;
- Reformat records on output;
- Perform summaries of designated numeric fields;
- Produce reports with pagination, headings, dates.

3. GREATER VERSATILITY. SyncSort CMS is a bird for all seasons:

- It can be invoked from other COBOL, PL/1 or BAL programs.
- It sorts CMS, SAM (OS or DOS) or VSAM files.
- It dynamically allocates space on TDSK.

4. TOP-FLIGHT SERVICE. Ours is the best in sorting. More than 85% of all inquiries are resolved within 24 hours.

If you'd like to realize the full potential of VM/CMS, give us a call, and we'll introduce you to SyncSort CMS. It's a great chance to replace a vulture with an eagle!

SyncSort CMS
Performance Improvements

VTIME: 50%
TTIME: 60%

Vault takes page from Brinks

By John Gallant
CW Staff

ATLANTA — Laurence Murphy thinks data should be treated the same way Brinks, Inc. handles money. So when the vice-president of the armored car company failed in 1981 to convince his peers at Brinks that the time was ripe to enter the information security marketplace, he joined forces with real estate investment specialist Richard Ornstein to establish the Vault Co. here.

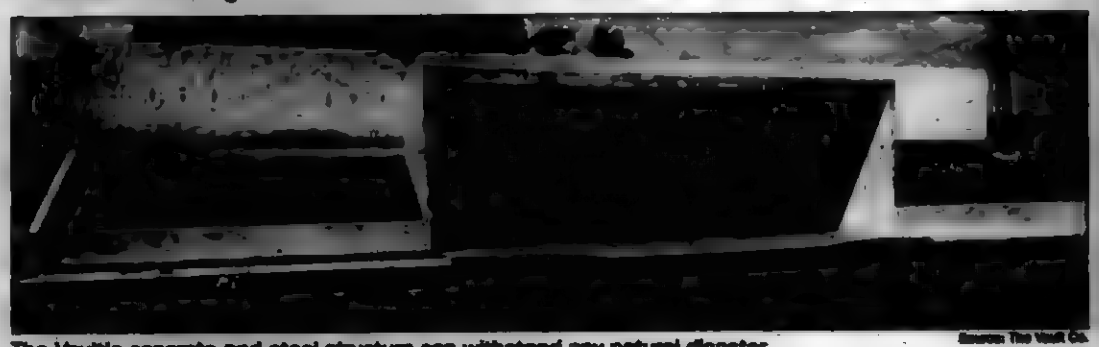
The Vault, according to Murphy, is the first facility to offer "complete off-site data protection," which he said includes guaranteed physical security and environmental safety, in addition to the Vault's software source-code escrow service. The Vault's data library was built to store as many as 100,000 computer tapes inside a concrete-and-steel structure, which, Murphy claimed, can easily withstand any natural disaster.

Murphy said it costs clients an average of $1 per disk each month to store computer tapes in the Vault's data library. Considering the value of the data stored on those tapes, he said, that expense is minimal.

Asked what makes the Vault different from other data storage and disaster recovery facilities, Murphy replied, "Most of these so-called off-site facilities are nothing more than warehouses. We provide total physical and environmental security, in addition to escrow services you could only get from a bank before. We are a trained third party equipped to provide complete data security and disaster recovery services."

According to Murphy, the data library is watched over by closed-circuit television monitors and bonded security guards behind bullet-proof glass. Only a trained data librarian utilizing a computerized tape retrieval system has access to the tapes stored in the library, which is both temperature and humidity controlled and equipped with a Halon fire-protection system. Clients must undergo a signature-matching process to verify their authority to take delivery of tapes.

In addition to magnetic tapes, the Vault was designed to house data stored in hard copy, hard disk packs, diskettes, microform, microfilm and cassettes. Clients can transport their media to and from the facility via the Vault's own environmentally controlled vans, which maintain constant temperature and humidity levels. Constructed of more than 3.6 million pounds of concrete and steel, the Vault incorporates physical security techniques recommended by experts at IBM and the Federal Reserve Bank, Murphy said. A mobile storage system in the data library utilizes tape racks that move along rails built into the concrete floor.



The Vault's concrete-and-steel structure can withstand any natural disaster.

Banks linking fingerprint scanners to terminals to foil thefts

By David Myers
CW New York Bureau

NORTH WHITE PLAINS, N.Y. — Would-be holdup men hoping to steal some of the millions of dollars that banks transfer over the wires each day may find themselves foiled by a device invented by a four-year-old company here just coming out of its development phase.

Fingermatrix, Inc. has already installed 17 of its digital fingerprint scanners in banks such as Chase Manhattan and Chemical Bank in New York and First Interstate and Wells Fargo in California. The scanners sit next to the banks' terminals and must be stroked before a user can gain access to a terminal. Only authorized users — whose fingerprints are kept in digital form in the bank's mainframe system and accessed by the terminal to which the scanner is attached — are granted access to the terminals.

"The scanning takes roughly a second," explained Richard C. Kjeldsen, finance vice-president for the company. "The device compares the user's fingerprint to a digital record of what the print is supposed to look like and either verifies it and permits access or denies access."

The scanning device is linked to a controller, which then plugs into the terminal, such as an IBM 3270. Modifications in the mainframe's operating system software are required to make the scanner work, according to Kjeldsen.

The two-piece setup costs approximately $6,500.

Kjeldsen said the scanner was developed to prevent electronic funds transfer heists from inside a bank. "With wire transfers carrying half a million to a million dollars a shot, you might want to require the user to verify his identity before each transaction," Kjeldsen said.

The scanning device also prepares an audit trail for each transaction, keeping track of who logged on to the system at that terminal, how long he had access and how much money he added to or subtracted from the bank's accounts.

But the device is effective for foiling outside-the-bank-walls capers, too. "Since the system is configured to require fingerprint verification before access is granted, it can prevent wiretap thefts," Kjeldsen said.

Fingermatrix, a public company that raised $5.5 million in its second offering last December, foresees other uses for its scanning device. "In hotels you might register with a fingerprint and use that instead of a key to get into your room. Ultimately, the fingerprint might even take the place of a plastic (credit) card," Kjeldsen said.

But the company is not insensitive to potential abuses of its biometric access system.

"Eventually, one could conceive, if one were so inclined, a system that could track the comings and goings of the populace. But we view that as an abuse, and it can be protected against," Kjeldsen said. "It's not quite as threatening as people might perceive."

FRAUD from page 1

ran dry. "I figure I gave away between $20,000 and $30,000 of my own money," said Slyngsted, who now programs Apple Computer, Inc. microcomputers for prison administrators. "If I had it to do all over again, I'd still give away the money. I've been broke myself — I know what it's like."

Slyngsted said he never claimed to be a high-technology Robin Hood; that title was thrust on him by reporters.

State police agreed that Slyngsted just didn't make it as a crusader for the poor. "The claim that he gave all that money away was just an attempt to minimize his sentence," Crawford said. "He had this reputation for being a big spender down at Charlie's Tavern, where he would buy everyone rounds of drinks. He was also a big talker and that was part of his downfall."

At Charlie's Tavern nowadays, Slyngsted is a frequent topic of conversation. It's true, Silva said, that the bar's new celebrity once gave an unemployed carpenter $600 so he could buy a new truck. But the newspapers' claims that Slyngsted casually dropped $100 tips for the bartenders were totally false.

"Sure, he loaned people money and wouldn't take it back," Silva said. "But a lot of that was just him trying to be a big man. He wasn't what the papers cracked him up to be. He did it all for attention."

According to Slyngsted, the Department of Social and Health Services has filed suit for triple damages to recover the purloined funds. The state has already attached his retirement fund and savings, and he claimed authorities are demanding at least $30,000 more in repayment.

And to add insult to injury, Slyngsted has been permanently banned from Charlie's Tavern.

"He's been permanently kicked out," Silva said. "He gave us a bad rap. He made this place look like a home for the poor and downtrodden. He made it sound like this was some sort of skid row joint. We serve the businessmen of Olympia here," Silva added.

Benefits of bypass lauded

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — Bypass facilities pay for themselves in three years or less, but the nonfinancial benefits of bypass may be even more important, three companies that bypass the telephone network said here last week at the Communication Networks Conference & Exposition (Comnet '84).

Instead of waiting months for the phone company to supply a 56K bit/sec channel, William H. Traylor said he can obtain the needed capacity almost immediately because his bypass network has the necessary bandwidth and is easily reconfigurable. Traylor, director of corporate communications for Wang Laboratories, Inc., manages a broadband cable network that ties together his company's facilities in and around Lowell, Mass. The cable, leased from a local CATV company, is now 47 miles long; it is being expanded to 70 miles.

Wang's bypass system supplants 4,500 voice-tie lines and 100 data circuits, Traylor reported, but it has far more capacity than that — 10 full-motion video channels for teleconferencing and 31 T-1 (1.5M bit/sec) channels. Thirty-six of the T-1 channels are used for voice communications; each T-1 carries 44 digitized voice signals, coded at a rate of 32K bit/sec. The remaining 45 T-1s are used for data transmission at speeds up to 56K bit/sec.

Traylor said the cost of the new cable system is less than $40,000 a month. The formerly used leased facilities cost $67,000 a month.

A vote for satellite

Satellite channels are "the corporate telecommunications network of the future," contended Dale Cunningham, telecommunications director of Harris Corp. Satellite channels provide the flexibility required by present corporate data communications — the ability to transmit voice, data, image and video bit streams on a dynamically reconfigurable basis — and they are less expensive than comparable terrestrial bandwidth, he said.

Harris is now using satellite circuits to connect its headquarters in Melbourne, Fla., with company sites in the West. Cunningham reported that a 1.5M bit/sec satellite link between Melbourne and Dallas costs $26,000 a month; AT&T's Accunet 1.5 service costs $34,500. Between Melbourne and the West Coast, the satellite facility is nearly $50,000 a month cheaper — $26,000 vs. $74,000 for Accunet 1.5.

Cunningham predicted that many corporate users are also going to be driven to bypass facilities because of the AT&T divestiture.

Possibly the largest bypass network to be built recently is the Westinghouse Electric Corp. digital integrated network, which utilizes 2 GHz, 12 GHz and 18 GHz microwaves to interconnect 20 switches serving some 17,000 station lines within the Pittsburgh metropolitan area.

Dr. K. Banerjee of GTE Business Communications, Inc., which supplied the switching equipment, reported at Comnet '84 that Westinghouse expects to save $66 million during the first 10 years the new network is in operation.

Datakit-System 85 tie set

WASHINGTON, D.C. — AT&T's Dimension System 85 private branch exchange will become interfaceable to local-area networks later this year, AT&T Information Systems, Inc.'s head of product development, Frank Vigilante, said here last week in an interview at the Communication Networks Conference & Exposition (Comnet '84).

Some arrangement of Datakits will be added to the existing System 85 architecture later this year, Vigilante said.

The Datakit, a virtual circuit switch, is the central element in a star-type local-area network announced late last year by AT&T [CW, Dec. 12].

The addition of this capability to the System 85 has been widely predicted for some time by consultants, but Vigilante's statement was the first official confirmation that it is being planned.

Adding the Datakit to the System 85 is intended to enlarge its prospective market. Users with heavy data communications requirements would be able to route that traffic through an alternate switching device, thus reducing the danger of blocking service to their voice terminal users.

HP from page 1

as well as the HP software. "This is a major shift in our market presence," said Jeff Williams, HP's product line manager for the new service. The joint venture with Vitalink will enable the HP user to obtain services it must now obtain from several suppliers, Williams added.

Vitalink, a manufacturer of satellite earth stations and supplier of satellite-based private networks, has negotiated similar joint ventures with Tandem Computers, Inc. and Electronic Data Systems, Inc.

Doll sees T-1 dynamic mux bowing this year

COMNET '84

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — Dynamic multiplexers able to connect multiple voice and data channels to 1.5M bit/sec (T-1) transmission channels and reconfigure them in real-time to meet changing traffic demands should become available within the coming year, consultant Dixon Doll said here last week.

This development will be one of several reflecting the emergence of a new network architecture based on the integration of voice and data bit streams, Doll told the Communication Networks Conference & Exposition (Comnet '84) held here. Two basic factors are responsible for the new architecture:

■ The growing use of computerized workstations — including personal computers — by information workers, thus increasing the need for data communications facilities.

■ The divestiture/deregulation of AT&T, resulting in a much bigger and more lucrative data communications market in which AT&T as well as its former operating companies are able to market additional products and services.

T-1 channels are a basic element of AT&T's marketing strategy, Doll contended. The company is now aggressively promoting them as backbone links in corporate communications networks, and a number of vendors are now developing dynamic multiplexers to enhance the T-1 channel's usefulness.

Meanwhile, thanks largely to recent tariff changes, the T-1 is becoming increasingly cost-effective, Doll noted. When used to carry voice and data, it offers many users the same economies of scale.

Doll believes AT&T's recently introduced Datakit virtual circuit switch [CW, Dec. 12] is another key element in the company's new data communications architecture. He expects the Datakit, which is the central element in a star-shaped local-area network, to be connected to the System 85 voice/data private branch exchange (PBX), thus providing an efficient way of interconnecting all of a user's low- and high-speed data terminals.

For the user with a voice-only PBX, Doll said that one option is to route traffic, wherever possible, over common local loops to the PBX or an adjacent point and divert it from there to separate voice and data switching devices.

Let us bear your PC burden.

General Electric now offers relief for busy managers of information systems: complete service for your company's personal business computers. On-site right where they are, or at GE service centers from coast to coast.

With GE as your service source, you choose any one of several service options that's best for you. For example, we have a program that provides you with a loaner while your PC is at our service center. If you opt for on-site contract service, we can respond fast, day or night, if something goes wrong.

So take a load off your shoulders. For more information, call Bob Rachowski, Manager—National P.C. Service Sales, (518) 385-4892.

Put GE on your PC.

NETWORK from page 1

in Ethernet baseband systems.

Star couplers available for Fiber Optic Net/One allow connection of up to 62 NIUs per star, with the added capability to interconnect stars. The maximum distance between NIUs in single-star configurations is 2,800 meters, according to the vendor.

The cost of an entry-level system with 12 device-interface ports begins at $25,000, including NIUs, Network Management Facility software, transceivers, star couplers and the Network Operating System software. A typical Fiber-Optic Net/One with 200 device-interface ports costs $135,000.

Further information is available from Ungermann-Bass, 2560 Mission College Blvd., Santa Clara, Calif. 95050.

New SBS service

Also at Comnet '84 last week, Satellite Business Systems (SBS) announced a communications network service called the Skyline Network Service. An enhancement of SBS' Series B communications network service, Skyline will provide integrated voice, data and image transmission for applications ranging from telephone calls to videoconferencing and electronic mail.

The service will be implemented in phases beginning in the second quarter of 1984 and will be available 24 hours a day. There is a $15 minimum monthly usage charge.

Day, night and weekend rates can be obtained from SBS, 8283 Greensboro Drive, McLean, Va. 22102.

Modems from DEC

In another announcement made at Comnet '84 last week, Digital Equipment Corp. introduced the DF100 series of modems, which features 1,200 to 9,600 bit/sec operating speeds, integrated automatic calling and standard RS-232C and RS-423A interfaces.

The five modems in the series, the DF104, DF112, DF126, DF127 and DF129, use the same circuit cards or modules in both stand-alone and rack-mount versions. Prices range from $545 for the rack-mounted, terminal-end, 150- and 2,400 bit/sec DF104 modem to $3,045 for a stand-alone, DF129 9,600 bit/sec, leased-line modem.

Further information is available from DEC, Maynard, Mass. 01754.

NEWS

AT&T packet net promised by year-end

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — AT&T said here last week that its previously announced Accunet Packet Service will be available nationwide by year-end through a six-node network.

The Accunet Packet Service is an upgrade of AT&T's Basic Packet Switching Service (BPSS) [CW, Sept. 26]. Accunet allows users to share switching and transmission facilities; BPSS users share only the switching facilities. Moreover, while BPSS is available at 9,600 and 56K bit/sec, Accunet also includes 4,800 bit/sec service.

The Accunet offering, unlike packet-switched services marketed by Tymnet, Inc., GTE Telenet, Inc. and other independent vendors, does not include protocol conversion because of a limitation in the Federal Communications Commission's Second Computer Inquiry decision.

It will, however, be directly accessible by any terminal or customer host computer that supports the CCITT X.25 standard set of essential features, said Judy Arenstein, who is in charge of marketing the offering.

Arenstein announced Accunet at the Communication Networks Conference & Exposition (Comnet '84), where she was among the speakers at a session on public data networks.

Accunet Packet Service will be priced considerably below BPSS, according to Arenstein. "Based on our present thinking," she said, "the port charge will be 35% less than what BPSS users pay," while the usage charge — both for packets transmitted and calls requested — will be 50% less.

Volume and time-of-day discounts are planned. Arenstein said users transmitting "more than 12,000 or 15,000 packets per month" would qualify for reduced rates.

Tariff submitted next month

A tariff covering Accunet will be submitted to the FCC next month. It will carry an effective date 45 days after the submission date, Arenstein said. The first two Accunet Packet Service nodes, in New York and Chicago, are already up and operating. Four others — in Atlanta, Dallas, Los Angeles and Denver — are scheduled to begin operation before the end of this year.

Although Accunet Packet Service initially will support only X.25, it will be in enhanced version of that protocol's set of essential features. Arenstein said the enhancements consist of "fast select," "fast select acceptance," accommodation of up to 256 outstanding data packets, window sizes of either two or three packets and hunt-group support.

Support for the CCITT X.75 internetwork protocol is scheduled to be added in 1985, she noted.

U.S., Japan sign extension of sales pact with NTT

WASHINGTON, D.C. — Japanese and U.S. government officials last week extended for three years an agreement to facilitate the sale of U.S. telecommunications equipment to Nippon Telegraph and Telephone Public Corp. (NTT), Japan's communications monopoly.

Some U.S. government and industry representatives have criticized Japanese performance under the existing agreement, but a recent survey of American telecommunications companies found most in favor of extending the arrangement as the best means for gaining access to NTT's $9 billion annual equipment purchases.

In 1983, U.S. sales to NTT totaled $140 million, up from $12 million in 1981 but still far short of the $700 million in Japanese telecommunications sales to the U.S. last year. New terms under the extension signed here last week will allow U.S. firms to participate on an equal basis with Japanese companies in NTT early-stage research and development activities and allow U.S. firms to submit contract bids in English. NTT will also translate contract terms into English for U.S. suppliers under the new terms.

The extension was signed by U.S. Trade Representative Bill Brock and Japanese Foreign Minister Shintaro Abe. Both praised the agreement as a major step forward in U.S.-Japanese trade relations.

However, a number of telecommunications trade problems still remain. In particular, Japan continues to refuse to buy U.S. satellites, insisting that Japan develop its own space capabilities. In addition, the U.S. State Department is negotiating with Japan on that country's proposal to deregulate part of the NTT monopoly, specifically in the private provision of value-added networks, a move that is likely to include restrictions on participation by non-Japanese-owned companies.

If it seems like you never have enough good programmers, Wiley has some very good news for you.

THE WILEY DATA PROCESSING TRAINING SERIES

To look at the ads in computer magazines these days, you'd think the answer to every business data processing problem was some new piece of equipment. But you know your job better than that. Hardware isn't going to get you out from under your programming backlog. People are.

Training people to get the job done—and training for *less*—is what the Wiley DP Training Series is all about. It's a comprehensive series of field-proven, fully self-instructional courses in applications programming, written and tested by nationally known DP trainers. No expensive "bells and whistles"—just sound, structured programming skills, taught in a practical, step-by-step format that works.

Use them for in-house training sessions (our **Leader's Guides** make it easy for you to conduct your own training seminar). Or give them to your employees for self-study. Either way, you can train new programmers or improve the productivity of your present staff—and do it at a fraction of the cost of canned DP training packages or seminars.

- **A practical job-skills orientation**—with hundreds of on-the-job examples and exercises, plus self-tests, sample input and output, and plenty of practice in real applications problem-solving.
- **Machine independent**—use with IBM, DEC, Burroughs, Honeywell, and other hardware—you can even train on microcomputers!
- **Complete training in COBOL programming in just 4 books** (15-20 hours of study for each) takes trainees from knowing no programming at all to advanced COBOL commands and techniques
- **Low cost**—only $49.95 per volume (less than the cost of leasing a conventional A/V program for one month!)

Future courses cover Ada, JCL, OS Assembler Language, System 370 Architecture, and other topics. For complete information, write to Kent Livingston, Dept. 4-1365. Or order direct by phone, and examine any course FREE for 30 days.

Write today for more information on any of these Wiley Data Processing Training courses.
Each self-contained volume can stand alone, or work as part of an integrated training program.

Micros seen causing minimal PBX delays

COMNET '84

By Lynn Haber
CW Staff

WASHINGTON, D.C. — When private branch exchanges (PBX) are used for switching data from personal computers, the micros' "holding times" will not be long enough to have a major impact on the PBXs — and if they are, there is something that can be done to correct the problem, Dr. James Jewett told a session entitled "Personal Computer User Patterns and Their Effect on Corporate Networks" at last week's Communication Networks Conference & Exposition (Comnet '84) here.

Jewett, who is president of Telco Research, Inc. in Nashville, reported that about 85% of personal computer usage in organizations does not involve communications. In many organizations, he noted, that figure goes as high as 98%.

"Most statistics show that during business hours, the impact of personal computers on networks has not been [major] in the sense that traffic looks a lot like voice traffic when you separate it into early morning/late afternoon hours vs. the rest of the business day [9 a.m. to 4:30 pm.]," Jewett said.

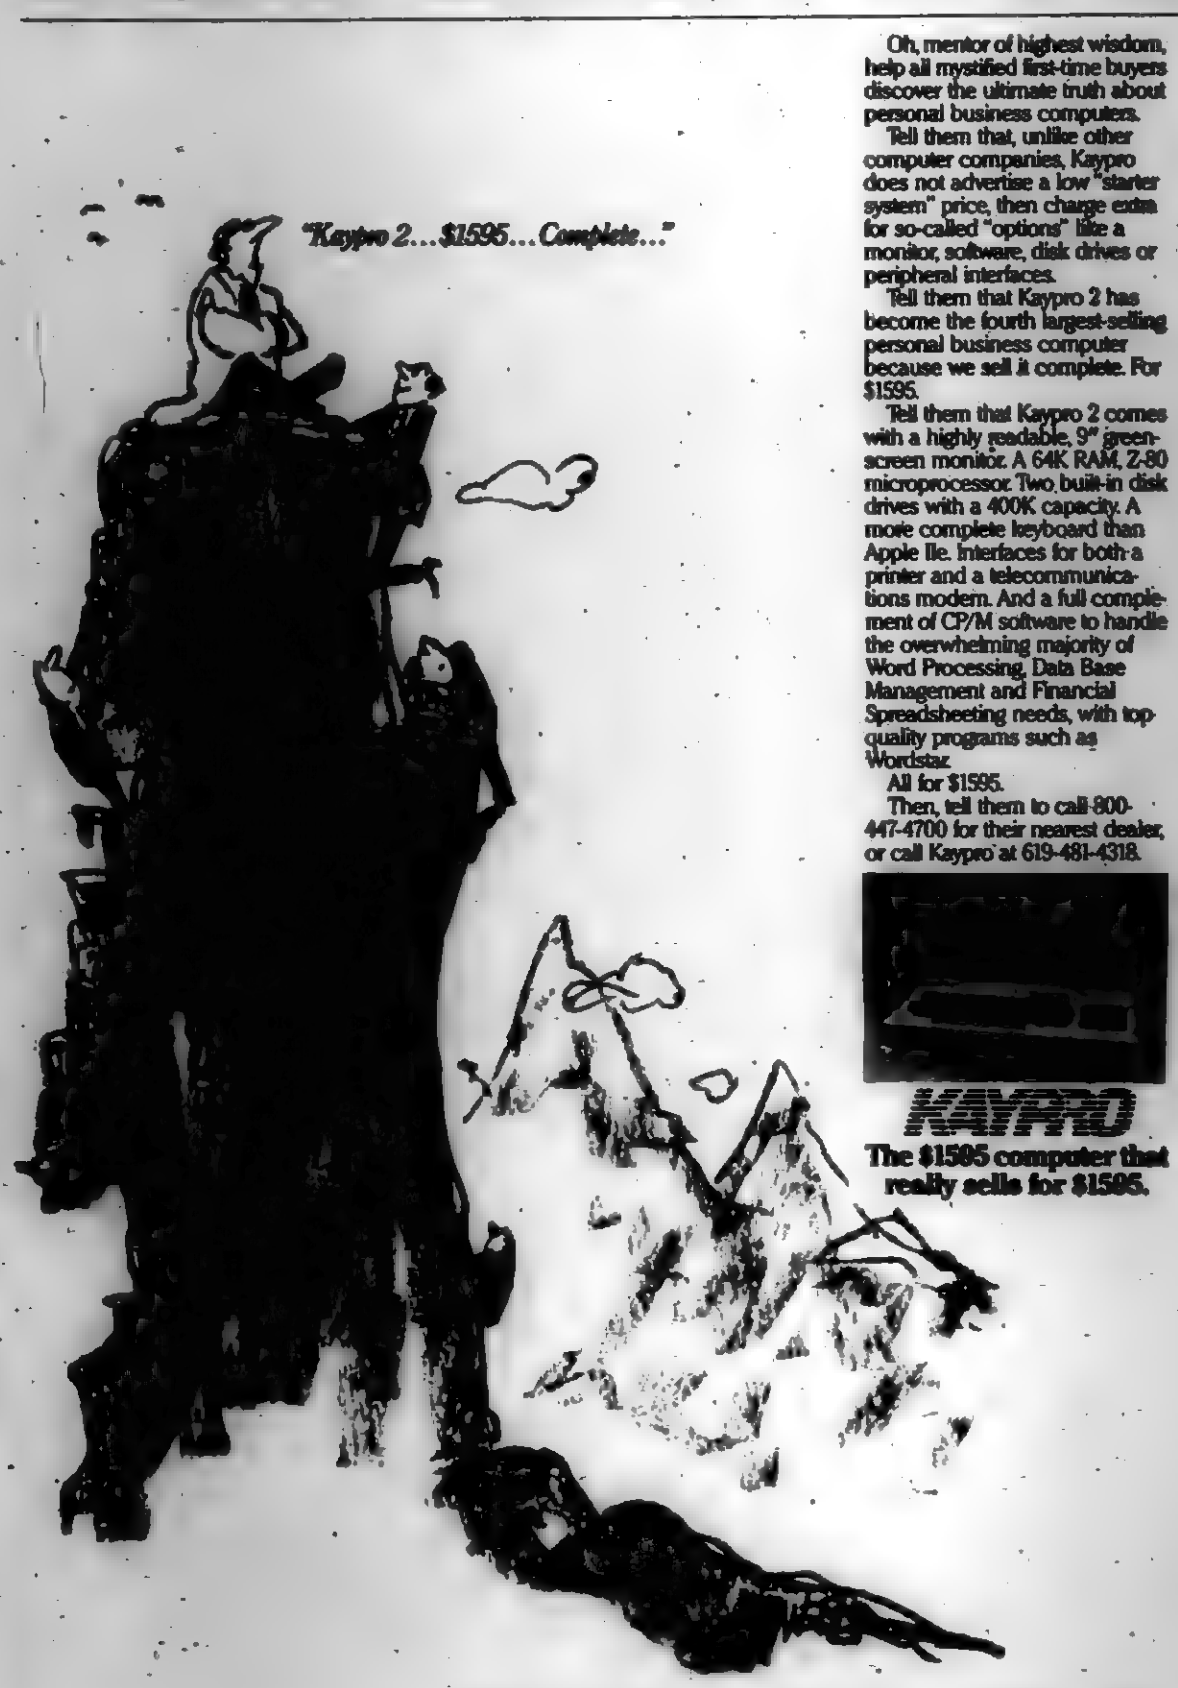
Therefore, fears of PBX engineering problems from long holding time due to things like personal computer terminal traffic do not hold, according to the speaker. And the use of standard traffic engineering formulas is acceptable when calculating PBX implementation.

"One of the greatest problems with personal computers is to take a given as a given," Jewett said. "The demand for personal computer usage can be very much designed to manipulate demand."

One way to improve a corporate network's service level is to look into personal computer applications and design the personal computer network with the aid of the telecommunications department. Because most organizations are buying microcomputers at a rapid rate and controls and coordination of micro usage aren't stabilized, traffic is going "topsy-turvy," according to Jewett.

"Organizations must come up with some policies to coordinate decision-making and applications design," he said. "Today's problems are not with PBX design, but with organizational planning and understanding of needs."

"Before [AT&T's] divestiture, networks that were centralized were economic. Centralized tandem networks with local networks tied into them aren't economically justified anymore," Jewett said. "There's a trend against the economic justification of networks which is allowing more and more locations to be segmented away from the network — and micros are playing a bigger role in that."



Keynoter calls for integration

By Lynn Haber
CW Staff

WASHINGTON, D.C. — Integration of technology, management, planning and organizational structure is the key to successful computer/communications networks of the future, according to Dr. Howard Frank, president of Contel Information Systems, Inc. Frank delivered the keynote address on "Network Technologies" at the Communication Networks Conference & Exposition (Comnet '84) held here last week.

Frank addressed the issue of integration as the next necessary step to meet the challenges of the 1990s. "In-house and in the industry, we must take all of the things we've been doing in the last decade — building information systems — and make them work together," Frank said. "If we don't do that, we will continue to propagate stand-alone systems, which present part of the problem and part of the solution, and which have to be updated so frequently that you never catch up."

The true merger of the computer and communications fields evolved in the decade between 1970 and 1980, according to Frank. Today, we are faced with networks that are both computing- and communications-oriented. "The way I would describe the network of 1984 is via distributed data processing with intelligence — at the terminal, the controller, peripherally at the network, within the network, at the front end, the host and at the back end," Frank said.

Communications nets are smart and getting smarter because of a decrease in computing costs compared with the cost of communications. "With the use of more sophisticated computing techniques, you can now pack more things into the network over the same basic communications lines of yesterday," Frank said.

State nixes nonpaper bonds

By James Connolly
CW Staff

DOVER, Del. — "Book entry" state and municipal bonds — bonds that are recorded electronically rather than on paper — probably will have their time, but that time hasn't arrived yet, the state of Delaware recently discovered.

Four of the five bidders in the state's $50 million bond sale last month declined the state's suggestion that they stop issuing paper certificates to investors.

But even officials of the securities firm that won the bid with a conventional proposal admitted that state and municipal bonds will inevitably follow the lead of U.S. government securities.

"We are in favor of book entry and think it is inevitable that it is going to become an everyday occurence. We had a few big customers who were not ready to go that way, although they too are in favor of book entry in the long run," said Peter T. Clarke, a vice-president of Morgan Guaranty Trust Co. of New York.

Morgan Guaranty produced the low bid for the Delaware bonds with an interest rate of 8.28%, despite having to pay an extra $1 per bond toward the state's expense for producing paper bonds.

Noting that he expects the majority of new bonds to be in book entry form in a year, Clarke said he sees no logistical or computer problems with administering book entry systems; however, he said investors have been cautious because of what they perceive as legal problems in some states. "Registered bonds were the same way when we went from bearer bonds to registered bonds, but it did come about," he noted.

Less expensive than paper bonds

The driving force in the Delaware proposal was State Treasurer Janet C. Rzewnicki, who claimed that book entry bonds would be significantly less expensive than paper bonds not only when issued but when transferred. She said the $1 per bond charge will cover only a fraction of the cost. She also cited the improved security aspects and reduction in "hassles" in book entry systems.

"We still feel very strongly that the market is going to come around. It's just a matter of time. We were happy to see that the only bidder that chose the book entry system this time [Prudential Bache Securities] had a very competitive bid [8.35%].

"I know that other states are planning to try book entry, and I fully expect it to be in use by the time we have our next bond issue in a year or so," Rzewnicki reported.

Martin Marietta wins bid

WASHINGTON, D.C. — The U.S. Department of Transportation announced last week that it has awarded Martin Marietta Corp. a $484 million contract to manage the Federal Aviation Administration's (FAA) $10 billion air traffic control system upgrade project.

Martin Marietta, the aerospace hardware producer whose headquarters are located in nearby Bethesda, Md., has teamed with six subcontractors for the five-year contract, which carries options of three-year and two-year extensions.

The group will review and oversee the development of the National Air Space System; it will also provide software validation and various technical support services to the FAA.

The National Air Space System plan, which was inaugurated two years ago, will reportedly include replacement of the IBM 360-era computers that support the current air traffic control system, development of new software for increased FAA automation and the phasing in of more sophisticated controller equipment and flight-support facilities, including new radar, communications, landing and weather-reporting systems.

Martin Marietta said it expects to have as many as 1,000 persons working on the FAA project at the height of the contract.

Eastern reverses micro policy

MIAMI — Reversing an earlier ruling, Eastern Airlines has decided to let passengers use portable personal computers and other battery-powered electronic equipment on board its airplanes.

Eastern said it reached its decision last week after extensive testing had produced no evidence that such equipment interfered with aircraft navigation and communications equipment.

Electronic equipment tested and approved by the airline for on-board use included personal computers, electronic games, solid-state calculators, hearing aids, heart pacemakers and portable recorders, a spokesman noted.

The airline said that it will continue to prohibit the use of walkie-talkies and radio-controlled toys and that, as a precautionary measure, neither personal computers nor recorders can be used during takeoffs and landings.

Micro operating systems: a crowded stage

PRODUCT SPOTLIGHT

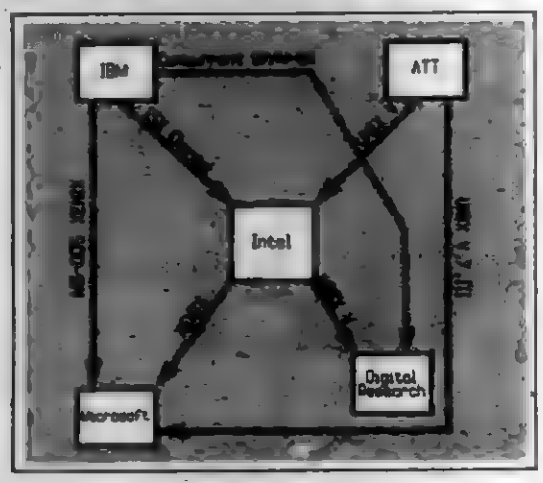
By Patricia Keefe
CW Staff

You've bought microcomputers for your end users. Should you stay with what you've got, or should you line up your users on the leading edge? And what is the leading edge when it comes to microcomputer operating systems?

If you've been watching the marketplace drama along with everyone else, you know that the scenario for microcomputer operating systems is changing simply because micros are becoming more powerful. The previous stars — Digital Research, Inc. and Microsoft, Inc. — may soon find themselves playing cameo roles as AT&T and IBM take center stage.

While this is supposed to be The Year of Unix, not everyone is giving it rave reviews. But no matter what view of Unix is entertained — bloated and overhyped or the greatest thing since digital transmission — it appears that the 15-year-old operating system developed by Bell Laboratories will, by default, become the standard for microcomputer-based multiuser, multitasking and/or networked environments.

Why by default? Because 32-bit micros are expected to replace 16-bit micros soon, and Unix currently is the most popular hardware-independent, multiuser, multitasking operating system that can run in 32-bit environments. Moreover, Unix has achieved its popularity virtually on the strength of its own merits, as enthusiastic users — rather than vendors with something to gain — spread the word. So fixed is Unix's rising star that industry observers consider only one competitor capable of upstaging it. That competitor is, of course, IBM.



Strategic, Inc. chart

Key business relationships

IBM recently announced a Unix-like operating system for its Personal Computer (CW, Jan. 16), which many Big Blue watchers saw as an endorsement of Unix. Others, however, are convinced that IBM's announcement was merely a "smoke screen" or "preemptive strike" and that it is planning a VM-based operating system which could dethrone or at least provide an alternative to Unix.

At the same time, some analysts have not ruled out the possibility that an operating system developed by a lesser entity could rise to the top. Moreover, vendors of 16-bit operating systems such as Microsoft (MS-DOS and Xenix) and Digital Research (CP/M 86, Concurrent CP/M, MP/M and CP/M 68K) are not expected to fade away quietly (see story on page 15).

Another twist

There is another twist to what some have called "the battle of the microcomputer operating systems." Communications giant AT&T has announced its intention to move into the office product sector at the same time that IBM is said to be poised for entry into the telecommunications field. This will pit two of the largest corporations in the world against each other on two stages.

However, the general view is that AT&T is just learning how to compete and has its hands full juggling many roles under its current reorganization. Since it has no track record in the computer industry, it is bound to stumble, according to analysts interviewed recently, almost all of whom "would bet on IBM every time," in the words of Mac Lewis, president of the Irving, Texas-based Systems Center, Inc., a microcomputer communications software vendor.

IBM is expected to unveil a VM-based operating system for 32-bit and up machines later this quarter. "The Unix bandwagon is too strong for IBM to ignore, but it obviously doesn't want to use plain vanilla Unix," remarked Brian Jeffery, director of research for International Technology Group in Palo Alto, Calif.

Jeffery predicts that in addition to PC/IX, its Unix look-alike, IBM will endorse Xenix — Microsoft's version of Unix System III — for its Personal Computer series. However, Strategic, Inc. President Michael Killen and other analysts believe an IBM version of Unix will effectively kill Xenix.

Another option for IBM is the adaptation of a System/36-like operating system to run on the IBM Personal Computer. Frank Gens, The Yankee Group's Director of Information Systems Research, noted that this would allow Personal Computer users to migrate to larger IBM systems.

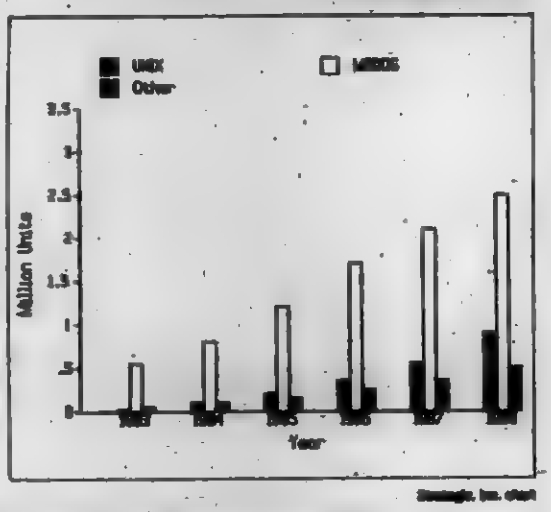
Beyond that, analysts expect IBM to offer a proprietary operating system that is a superset of Unix running under VM. IBM recently had seven or eight different Unix-related projects under way, but it decided about a month ago to consolidate those efforts. According to Gens, IBM has two ways to attack:

- It can go on the defensive and use a proprietary operating system to "suck in" users over a one-way bridge to IBM products.
- It can take the offensive, going against the idea of proprietary operating systems on the grounds it may encourage movement away from its hardware. IBM could assume that by providing a Unix-compatible system, it would be easier for users to move over to IBM. "This is an aggressive strategy that supposes that competitively priced hardware and functions will make it attractive enough," Gens said.

Robert Fertig, president of Enterprise Information Systems, Inc., agreed: "IBM is looking at the situation and realizes that it can't stop Unix from moving forward, but it can enlarge on Unix, providing features to entice users over a one-way bridge to IBM systems."

It is generally agreed that Unix has a lot to offer. It is said to be the most portable and open-ended operating system on the market today. Among

See SYSTEMS page 16



Strategic, Inc. chart

Market for 16-bit business computers

Some guidelines for evaluating operating systems

Evaluating operating systems is not quite as cut and dry a task as comparing hardware configurations. Nevertheless, it can be done.

"First, determine what problem you want to solve, what applications are available and what operating systems they run on," advised Michael Killen, president of Strategic, Inc., a San Jose, Calif.-based research house. In many cases, the operating system and hardware are secondary to the application, noted Mac Lewis, president of Systems Center, Inc. in Irving, Texas.

The increasing demand for portability between systems has resulted in efforts toward providing that capability in systems that are currently lacking in this area. Unix is considered by many analysts to be the most portable operating system on the market today.

Assuming that application package and operating system incompatibilities can be solved, a user might wonder why he should bother to examine any operating system features further. Consultants warn that just because two operating systems run the same package, it doesn't mean the end result will be the same.

Performance, for example, can differ. Some operating systems provide faster turnaround and response time than their competitors.

Also of importance is the environment within which the operating system runs: stand-alone, clustered or connected to a mainframe. A user who currently has a single-user, multitasking configuration but foresees moving to a multiuser configuration down the road not only does not want a single-user, single-tasking system, he wants one that will allow him to upgrade to the desired capabilities.

When choosing a personal computer and an operating system, limits are set on the software that will be available. If the operating system is changed, users are confronted with the nightmare of converting their existing applications, consultants warned.

Other issues of concern to the consultants and analysts recently interviewed include:

- Support — on several levels. Killen urges users to consider who will support their operating system. What type of documentation is available? Programmers need to consider whether an operating system will support the programming language they want to run.
- Required memory. Application programs are not the only system components with specific memory requirements. "If you have a 64K-byte system and the operating system requires 32K bytes, that won't leave you with breathing room," Killen warned. If there are multiple users, will a hard disk be required?
- Record locking. Will the operating system allow multiple users to access simultaneously the same data while, at the same time, protecting one user from another's updates?
- Language. According to International Data Corp., a market research firm based in Framingham, Mass., there is a trend emerging to move from operating systems to high-level languages as standards for portability. Digital Research, Inc. and Microsoft, Inc. are said to be writing operating systems in C and providing C compilers as part of their move toward Unix compatibility.
- Ease of use. How user-friendly or business-oriented is the operating system? One frequent complaint about operating systems such as Unix, which have migrated down from larger machines, is that they are too complex and technical as opposed to business-oriented.

Leading micro operating systems threatened

PRODUCT SPOTLIGHT

By Patricia Keefe
CW Staff

The growing power of microcomputers, some of which are capable of running mainframe applications, has created a corresponding need for more powerful and versatile operating systems. And as end users and vendors cast about for one to meet this need, it has become clear that the operating systems currently dominating the 16-bit microcomputer market will not be enough.

The search for a more powerful, hardware-independent operating system that can run in a multiuser, multitasking environment represents a solid threat to the market positions of Microsoft, Inc. and Digital Research, Inc., the vendors of those 16-bit, primarily single-user operating systems.

Microsoft is currently the lead runner, with an estimated 90% share of the market for 16-bit, single-user business operating systems. However, some analysts believe AT&T's Unix could spell doom for the high-flying vendor and its Unix look-alike, Xenix.

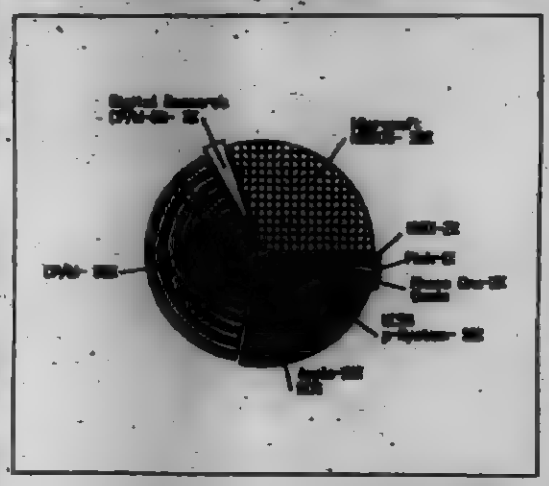
The same industry analysts believe Digital Research, which was unable to repeat in the 16-bit market its success in the 8-bit operating systems market, may be down but not yet out.

Regardless of whatever new directions the operating system market takes, there will continue to be a market for Microsoft's single-user, 16-bit MS-DOS and Digital Research's 8-bit CP/M and 16-bit, single-user CP/M 86 "from 'Mom-and-Pop' shops using unsophisticated, unintelligent stand-alones," predicted Robert Fertig, president of Enterprise Information Systems, Inc. in Greenwich, Conn.

Moreover, IBM's PC-DOS, its MS-DOS look-alike, still has a long life ahead of it. "IBM can't afford to and has no incentive to walk away from all those PC-DOS users," claimed Barbara S. Iagur, a microcomputer analyst for Paine, Webber, Mitchell & Hutchins in New York.

Differences between IBM's PC-DOS and Microsoft's MS-DOS are technically insignificant, although there are some important user differences, analysts agreed. According to Michael Killen, president of Strategic, Inc., PC-DOS was IBM's attempt to differentiate itself from everyone else, to get people to develop products for the Personal Computer market as opposed to other vendors' products that run MS-DOS.

Both Digital Research and Microsoft are widely credited with creating the generic — hardware-independent — operating system, which may well



Business operating systems market share, 1983

have accelerated the growth of the microcomputer industry. But neither vendor can afford to rest long on its laurels — not with AT&T Technologies, Inc.'s plans to support Unix System V; not with IBM's recent release of PC/IX, a Unix-like operating system for its Personal Computers ["IBM crosses AT&T border," CW, Jan. 23]; and not with IBM's rumored plans to release its own VM-based proprietary operating system.

With AT&T and IBM facing off in the multiuser, multitasking 16- and 32-bit future of microcomputing, Digital Research and Microsoft are working hard to preserve a position for themselves in what many analysts believe will be a Unix world. Those plans may be shaped by what Killen sees as the difference between the two companies: "Microsoft has the marketing, while Digital Research has more technicians."

Both vendors are working on what will eventually be a full integration of CP/M, DOS and Unix system environments, according to Fertig. In addition, both vendors have worked hard to court Japanese, Taiwanese and other foreign vendors in an attempt to make their operating systems the primary ones for microcomputers entering the U.S. market.

Moreover, Digital Research and Microsoft also provide language and compiler products. "Digital Research has good business in compilers, running on either CP/M or MS-DOS," said Mac Lewis, president of Systems Center, Inc. in Irving, Texas. "There are a lot more people buying compilers than is generally recognized."

Although neither Digital Research nor Microsoft has shown any interest in pursuing larger system markets, Strategic believes that this will change in a few years as both discover opportunities to move their programming language products (implemented in C) to other Unix systems, which traditionally comprise larger systems. In particular, Strategic predicts computer manufacturers of all sizes will be interested in having Microsoft's Xenix enhancements for their systems.

Other opportunities ahead for the two competitors include meeting expected user demand for functions such as voice input, artificial intelligence in system and application software, more elaborate graphics, extreme simplicity of command structure and programs that teach themselves and provide detailed assistance when required, according to Strategic.

"The greatest challenge facing Microsoft and Digital Research is to keep up with new software technologies in the face of mounting competition and to balance what can be done with what current systems can support and what users are willing to pay," Strategic concluded.

Digital Research challenged

One of the fathers of the generic — hardware-independent — micro operating system, Digital Research, Inc., has gone from total control of the 8-bit segment of the microcomputer operating systems market to second-best in the 16-bit segment of that market. And with the industry on the edge of creating a 32-bit, multiuser, multitasking standard, Digital Research may be facing its toughest challenge yet.

Although Digital Research was commonly viewed as having the 8-bit market sewn up with CP/M, IBM seriously snagged any dreams that Digital Research may have had for dominance of the 16-bit market when it endorsed Microsoft, Inc.'s MS-DOS for the IBM Personal Computer.

According to industry observers, IBM approached both vendors, but only Microsoft was willing to acquiesce to IBM's terms. Today, 90% of the 16-bit machines sold reportedly run under MS-DOS or its look-alike, IBM's PC-DOS.

"IBM talked to both, but Microsoft put together a package that suited IBM, including a few million for the license [for MS-DOS]. IBM got it for nothing," said Michael Killen, president of Strategic, Inc. "Digital Research didn't want to [suit IBM] and was a little narrow-minded in terms of what [IBM's endorsement] meant in the long run."

Although IBM later licensed Digital Research's 16-bit offering, CP/M 86, for the Personal Computer, that came much later, at a much higher price.

These same observers believe Digital Research has been playing catch-up ball ever since Microsoft eclipsed CP/M 86 with MS-DOS via the IBM endorsement. A recent report, "Digital Research/Microsoft — The Key Issues," by Strategic, is very critical of Digital Research's strategy and suggests that unless the vendor develops a coordinated plan of attack, it may be reduced to little more than a substitute player.

At least one consultant has gone on record as having said that in order to survive in the 16-bit world, Digital Research must recognize MS-DOS as the de facto standard and move toward compatibility with that system, which Digital Research has been trying to do. For example, it has a built-in DOS switch in its Concurrent CP/M 86 and is working on a Concurrent DOS operating system.

Another step in this direction is thought to be Digital Research's an-

See CP/M page 16

Weeds in Microsoft garden?

Microsoft, Inc. is the No. 1 vendor of 16-bit microcomputer operating systems, with a 90% market share and Xenix, a popular Unix look-alike that has made it the leading independent Unix software house, according to the market research firm Strategic, Inc. of San Jose, Calif.

Nonetheless, it will find competing in a Unix-dominated marketplace no bed of roses.

It was a nod from IBM that allowed Microsoft to overtake Digital Research, Inc. in the 16-bit microcomputer operating systems arena; when IBM endorsed Microsoft's MS-DOS for the Personal Computer, software writers lined up to develop programs compatible with MS-DOS. Not content to rest on its laurels, Microsoft developed its own version of Unix, dubbed Xenix.

Given its current market share and IBM's interest in Xenix, one might think Microsoft's place is assured in the multiuser, multitasking microcomputer operating systems marketplace. But according to industry analysts, there are a number of weeds that could sprout in Microsoft's garden of success and choke its position of dominance.

Despite MS-DOS's current and continued popularity in the single-user, 16-bit operating systems marketplace, MS-DOS as it now stands is not appropriate for IBM's plan to interlink Personal Computers, according to some analysts. Although Microsoft has been promising a multiuser upgrade to MS-DOS, users and vendors have grown tired of waiting, asserted Michael Killen, president of Strategic, Inc.

Microsoft is also expected to push Xenix heavily. "Xenix could offer a gateway between Personal Computers and other IBM systems," said George Colony, managing director of Forrester Research, Inc.

But research analyst Kenneth Lim of Dataquest, Inc. disagrees. "At one time, Xenix had a better chance of doing it, but IBM has moved away toward its own version of Unix," he said.

Xenix could run into several problems. First, it needs to be upgraded to Unix System V. Second, in addition to competing with Unix, it will have to compete with IBM's PC/IX and any other proprietary operating system that IBM may introduce.

Strategic's report noted that "if IBM were to create its own operating system for microcomputer products with MS-DOS compatibility or

See MS-DOS page 16

SYSTEMS from page 14

its features are a hierarchical file system, networking, on-line documentation, high-level languages and computer-aided instruction, to name a few.

Many analysts agree Unix is well-suited for the 32-bit environment. Lewis suggests a likely entry point for Unix would be a $20,000 system with 10M to 20M bytes of hard disk storage and 512K to 1M byte of memory. However, the publisher and editor of the "Unique" newsletter for Unix users, David Fiedler, thinks the $8,000 to $12,000 range is more realistic.

Chris Christiansen, who is also an analyst with The Yankee Group, thinks Unix is "the only viable alternative" for users who can't handle VM, but want to move beyond Microsoft's single-user MS-DOS system. Furthermore, he said, small vendors and developers can't afford the investment required by VM.

But Unix is not without its problems, according to even those analysts who give it the nod as the next microcomputer operating system standard. Its biggest problems are that it is difficult to use for nonprogrammers and non-DPers (Unix has earned a reputation as an operating system loved by programmers, but loathed by applications developers), it is not business-oriented enough and it requires an enormous amount of memory.

Moreover, few analysts believe there is a need for Unix at the 16-bit level, and most claim there is little Unix-based software for small micros. Kenneth Lim, a research analyst with Dataquest, Inc., maintained, "Unix has no importance in the micro market," primarily because the powerful and sophisticated system has yet to prove itself in the business environment.

Unix System V and VII, the two latest upgrades, have done little to alleviate this problem. Lewis said the two versions do not offer record locking and that multiuser business applications are difficult to run under Unix. Nonetheless; Unix is an idea whose time has come, Fertig said. And once AT&T unveils its promised 32-bit office system, even more attention will be focused on Unix.

The system is based on AT&T's 3B series of superminis, which runs under Unix [CW, Oct. 31]. According to "Unique," the series will run on Unix System V or System V Release 2, an upgrade the newsletter said will soon be released offering "better and more communications and networking support, but no file or record locking." The end-user price will be from $8,000 to $20,000, the newsletter predicted.

The strategic moves of the two giant competitors will not necessarily be the determining factor in the battle of the operating systems. Analysts are quick to stress that software houses and third-party developers could hold the winning hand. IBM and AT&T will have to expend a considerable effort courting this segment of the market and providing it with applications tools to make its job easier.

Remember the Seminar of 1776?

If Computers Existed 200 Years Ago, These Men Would Qualify as Seminar Leaders for Technology Transfer Institute

BENJAMIN FRANKLIN

As developer of the Post Office would discuss office automation and electronic mail.

ALEXANDER HAMILTON

Electronic banking and transfer of funds.

JOHN HANCOCK

Encryption and security.

THOMAS JEFFERSON

The inventor of indoor plumbing would discuss local area networks.

YOU WON'T FORGET THE SEMINARS OF 1984!

When you need to learn about a specific subject within the computer/communications and data processing industry, you really should learn from an expert. As those men were so considered 200 years ago, so will our speakers be 200 years from now. Call or send for our newest Spring 1984 brochure outlining all of our offerings. We urge you to attend one of our seminars and discover why TTI seminars have become the standard in the field against which others are measured.

CP/M from page 14

nouncement of GSX software for MS-DOS and PC-DOS. GSX is Digital Research's graphics package, which is based on the proposed Graphical Kernel System that it is trying to push as a graphics standard, according to analysts, who are generally positive about the software. In the meantime, in addition to its 16-bit operating system, CP/M 86, Digital Research has brought out CP/Net; Concurrent CP/M for multitasking, single-user operations; and MP/M for multiuser, multitasking environments.

Perhaps with the adage, "If you can't beat 'em, join 'em," in mind, Digital Research seems to be taking moves to strengthen its position in a Unix world. It has working agreements with two chip makers, Intel Corp. and Motorola, Inc., the latter announced at the Uniforum International Conference of Unix Users two weeks ago [CW, Jan. 23].

At Intel, Digital Research has taken over a project previously handled by Microsoft — porting Unix System V to Intel's 80286 chip. Fertig believes that as a result of this arrangement, Digital Research may be able to gain a dominant position in the 16-bit marketplace.

MS-DOS from page 14

if AT&T were to change licensing terms drastically for Unix, Microsoft could lose a major market share and a large fraction of its income."

Third, analysts do not expect IBM to endorse any particular version of Unix, but rather to allow its machines to run on everything. "Recent moves indicate that IBM will not support one operating system or another in the way that it did with MS-DOS," according to Barbara S. Isgur, a microcomputer analyst for Paine, Webber, Mitchell & Hutchins. "Instead, IBM will let the market sort it out." This means Microsoft cannot expect to get the same boost for Xenix that it got for MS-DOS from IBM.

Possibly as part of its Unix strategy, Microsoft has released Version 3.0 of MS-DOS, a C-code implementation of MS-DOS, complete with Unix-like features. The planned upgrades will move MS-DOS closer to Xenix. "Microsoft is well aware that the key to holding onto both markets is maximum application portability and evermore added value. The enhancements that Microsoft is making to both MS-DOS and Xenix are not available anywhere else and will not be for some time," the Strategic report said.

COMPUTERWORLD READER QUIZ

YES	NO

Programs help DP managers deal with staffs

By Robert Batt
CW West Coast Bureau

PALO ALTO, Calif. — A new series of software programs that reportedly enable senior managers to deal more effectively with their subordinates and peers is the center of increasing attention from computer users.

The three programs — The Management Edge, The Negotiation Edge and The Sales Edge — elicit from the user information about himself, the situation involved, the goal and the opponent or employee. Manufactured by Human Edge Software Corp., a newly formed company here, the packages run on microcomputers manufactured by IBM and Apple Computer, Inc. and on IBM-compatible microcomputers. The programs are the brainchild of Human Edge Software's co-founder, James Johnson, a clinical psychologist and former project director at IBM.

Using elements of psychological testing, game theories and expert systems, The Management Edge, for example, conducts a "dialogue" with the end user to elicit the fine points of strategy and to construct tactical plans that are customized to the user, client or setting.

The information is presented to the user in the form of a printout that "walks" him through the proper scenario to achieve the resolution of the problem.

"The Management Edge was very useful in determining what approaches I should take in dealing with particular situations," explained Robert Spiegelman, recently appointed director of the Kalamazoo, Mich.-based W.E. Upjohn Institute for Employment Research. "It showed me that I needed to act in a more confident, informal and interactive manner than I was used to. As a result, I have become much more accessible to the people I work with."

Spiegelman, former director of the Social Economic Research Center at SRI International, Inc., said that The Management Edge proved particularly useful in boosting a project on the employment implications of robotics, which had been moving very slowly.

The Negotiation Edge

Working with The Negotiation Edge, a manager answers a number of basic questions about himself, the other individual involved in the situation and the environment, and then he states his objectives. The computer then produces a step-by-step strategy comprised of opening bids, counteroffers, strategies for working with the other person, methods of countering objections and closing techniques.

According to Hal Ditmer, a partner and principal in the San Francisco consulting firm Sierra Resource Group, The Negotiation Edge was critical in a recent joint venture deal. "The program was very helpful in identifying the other person's personality traits. It showed me that the negotiation called for a logical, detached approach which appealed to the other person's intelligence and enabled him to make the offer.

"As a result, he made a proposal that I was amazed at," Ditmer said.

In another case, Bob Honig, marketing sales director of Silicon Valley, Calif.-based Victor Aviation Services, Inc., used The Sales Edge program to make major aircraft engine sales. "I use the package when I think I may have a stumbling block with a particular customer. I am able to build up a profile of the client and work out various strategies for closing a sale.

"Recently, I used the program to make a sale to the president of a local flying club. If I had used my normal routine, I would have scared the customer off because of his particular personality. By using the program, I was given essential ideas on how to succeed with him.

"I always follow the recommendations of the program to a tee," Honig added.

According to Human Edge Software, which put a $250 price tag on each of the three programs, no prior skill in computers is required to use the programs, and the entire interaction usually takes no more than 30 minutes.

"The Management Edge offers a new method of understanding and communicating with co-workers, subordinates and superiors by presenting expert management advice that can enhance the user's overall performance," Johnson said.

More self-help software

WOODLAND HILLS, Calif. — A psychologist here has developed four self-help programs for people experiencing psychological problems: "Handling Relationship Problems," "Coping with Stress," "Handling Depressed Feelings" and "Treating Sexual Problems."

"Many people who need help don't pursue it because they can't afford counseling or are too embarrassed to admit that they need it," said Dr. Robert Eeitman, the developer. "Personal computers alleviate these problems."

After the user enters data on menu-driven screens, each program helps to identify feelings or beliefs that create the problem and offers guidance to help solve it, according to the vendor of the software, Psycomp, Inc.

"These programs are not designed to correct serious psychological problems," said Nick Barnett, a Psycomp spokesman.

"They help cure minor problems or can be used with other psychological tools to treat serious problems," he said.

The programs, which cost $89.95 each, run on the Apple Computer, Inc. Apple IIe or the IBM Personal Computer, according to a Psycomp spokesman.

Psycomp, Inc. is located at Suite 101, 22035 Clarendon St., Woodland Hills, Calif. 91367.

Program tracks bid-rigging for Minnesota

By Paul Hemmesheimer
CW Staff

ST. PAUL, Minn. — The Antitrust Division of the Minnesota attorney general's office is using a computer program to evaluate highway construction contracts for evidence of bid-rigging.

Minnesota awarded $213.4 million worth of state and federal highway construction contracts in 1983. "Previously, the only way to track bid-rigging was a hit or miss approach," said Mark Steadman, an investigator in the antitrust division. "It was difficult to sort the volume of contracts written. Randomly, we would search files for cases of grossly disproportionate pricing. This program provides an organized approach. It helps us collect, analyse and interpret data."

The program produces statistical reports from parameters entered by investigators and a data base storing contract information. "The reports eliminate cases where pricing is reasonable and help identify construction projects with possible bid-rigging," explained Steven Kilgriff, an assistant attorney general. "Since installing the system 14 months ago, the number of cases under investigation has increased dramatically."

No charges yet

But no one has yet been charged with bid-rigging, which generally occurs when two or more contractors agree in advance who will win a public construction contract. "The computer is a useful tool for identifying possible bid-rigging cases," Kilgriff said. "Proving that bid-rigging occurs is an involved, time-consuming process." Nevertheless, "while I can't point to actual indictments since we began using the system, I will say that we have worked more efficiently and effectively since the program was installed. There are more cases under investigation now than there were previously."

The program was designed by the Massachusetts attorney general's office with funds from the U.S. Justice Department. "In 1981, our office became interested in the program," Kilgriff said. "The Mass. attorney general's office gave us the program. Currently, there are approximately 20 states using the program."

The Minnesota attorney general's office uses a Control Data Corp. Cyber 170/835 mainframe-based, time-sharing system residing at the University of Minnesota. Tailoring the program for Minnesota cost less than $5,000, according to the attorney general's office. "Time saved using the system paid for the original investment," Kilgriff said.

NETWORK HEALTHCARE

DATA COMMUNICATION NETWORKS AREN'T LIKE PEOPLE BUT...

One thing's for certain. Poor advice early in the design stage, the wrong equipment, or inadequate product support could make your network very sick.

We can help prevent that. Meet ComDesign's data comm "doctors". They are a group of dedicated, service oriented data communication specialists. Talented, qualified, and helpful, they dispense the application engineering answers that will keep your network in the pink. For large networks or small. And you don't have to be a ComDesign customer to take advantage of this service. As a matter of fact, you'll never even need an appointment. Just use the **toll-free** number below. The doctor's always in.

Bank meet set for L.A.

LOS ANGELES — James Wiesler, vice-chairman of the Bank of America, will deliver the keynote address for Expo '84, the Electronic Banking Conference and Equipment Exposition. The conference, sponsored by the Bank Marketing Association, Western Chapter, and co-sponsored by the Inter-Financial Association, will be held March 4-7 at the Hyatt Hotel here.

The conference will focus on the latest developments in electronic funds transfer and will feature more than 50 speakers participating in 43 separate educational sessions.

Registration is $465 for the first registrant and $385 for additional registrants.

More information is available from The Bankers' Institute, 21 Tamal Vista Blvd., Corte Madera, Calif. 94925.

Only Lee Data's Universal Terminal System can satisfy all of your information processing needs... 3270, Async and personal computing.

Finally, there's a single, universal way to satisfy the individual information processing needs of all your people. From sales manager to accountant. From research to production. The Lee Data Universal Terminal System can do it all.

And our system is modular by design to provide you any or all of these cost-effective, problem-solving advantages:

3270-compatibility *plus more*

Combine complete 3270 system-compatibility with an innovative Lee Data design and you have a System that delivers greater convenience and flexibility.

Our System not only offers standard 3274-compatible local and remote control units, but now also provides combination local/remote controllers with a unique dual-host access capability.

In addition, you can choose from a full line of terminal capabilities, beginning with our cost-effective 3178-compatible display on up to our popular All-In-One Display which offers, in a single unit, four selectable screen sizes—including 132-column—a great advantage in program development, spread sheet applications and many others where flexibility is required.

3270-plus-Async: another cost-effective advantage

If your application needs currently find you switching between 3270 and VT100-style terminals to get the job done, Lee Data has a better way.

As part of our System, you can enjoy the further advantage of a 3270/Async capability that allows dynamic selection of 3270 and VT100 operating modes from a single Lee Data display. A simple command entered at the keyboard provides you access to applications running on an IBM CPU, non-IBM systems (such as DEC, H-P or Prime), as well as timesharing services. Another Lee Data solution to simplifying your company's terminal network.

And now integrated personal computing too

That's right! Now our System also includes a sophisticated personal computing package that can easily be integrated into an existing Lee Data 3270 system.

With our approach, you get continued interactive access to host-based files, plus all the advantages of professional business computing from the same Lee Data workstation.

Advanced features include a host file transfer capability, a single-board design, four standard system expansion slots and, of course, complete IBM-compatibility.

All these additional capabilities plus the same user-friendly Lee Data displays.

Plus these added benefits...

To any Lee Data System, add our unique Coax Eliminator products and realize additional savings of up to 85% in cabling costs alone.

Combine this with all the outstanding features already mentioned and you'll find a System offering everything you need for efficient, cost-effective operation.

Discover the advantages of our Universal Terminal System for yourself. For more information, call our system specialists toll free:

"First Chicago is launching a whole world of new banking services with ***Tandem NonStop Computer Systems.***"

Donald R. Horton
Head - Systems and MIS
First Chicago Corporation

At The First National Bank of Chicago, providing responsive, on-line financial services for our customers is a major corporate priority. An important part of that commitment is the global implementation of core applications on Tandem NonStop Computer Systems.

Utilizing a common database structure on systems distributed throughout the world provides immediately useable information uniquely suited to internal reporting and accounting. Included are such time sensitive items as foreign exchange and money market transactions, loan contracts and SWIFT transfers. We call this system F.I.R.S.T. (First Chicago International Real-time System for Transactions).

Tandem systems also support our installed and expanding consumer and commercial funds transfer, balance reporting, and cash management systems, which move billions of dollars for our customers daily. Our Cash Station ATM switch is an excellent example. The modular nature of the Tandem solution enables us to sustain and improve quality by adding such capabilities incrementally, where and when they're needed.

The Tandem systems are on-line in sixteen financial capitals around the world. And they are very reliable. We continue to be impressed with the systems, the support and with our employees' enthusiastic acceptance. They are helping us improve customer service.

The NonStop System.

The only computer on the market today that can provide an integrated network of up to 255 processor systems supporting thousands of terminals in an on-line, transaction-based environment.

Tandem. Fully supported by worldwide sales, training, service and manufacturing organization.

For more information on the Tandem application at First Chicago and a copy of our brochure, "Solutions in Banking," contact your local sales office or Tandem Computers Incorporated, 19333 Vallco Parkway, Cupertino, California 95014. U.S.A. Toll Free 800-482-6336.

NEWS

Fose '84 slated for March 19-22

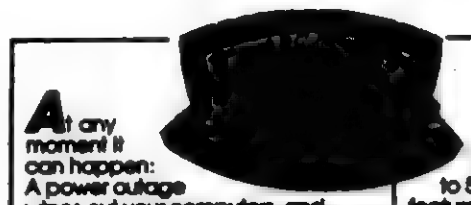
WASHINGTON, D.C. — The Eighth Annual Federal Office Systems Expo (Fose '84) will take place March 19-22 at the Convention Center here. Conference organizers expect conference and show participants to include office automation decision makers from both the federal and the commercial sectors.

Fose '84 will feature hands-on activities as well as lectures. Included will be a personal computer center, where registrants may experiment with personal computer hardware and software, and the Office Automation Game, where up to 125 people can practice management "game plans."

The first day will be set aside for 10 conference sessions, at a one-day cost of $150. The four-day conference will cost $375 for registrants signing up before Feb. 10 and $395 after then.

The show portion of the expo will run from March 20-22 at a cost of $95 per day. Registration is free until Feb. 25 and is $15 at the door.

More information is available from the show organizer, National Trade Productions, at 9418 Annapolis Road, Lanham, Md. 20706.



At any moment it can happen: A power outage wipes out your computers, and when it does, you lose big—in time, money and in important data.

What's more, power fluctuations are not only a problem for computers, but for many other types of sensitive electronic equipment. Telecommunications systems, security equipment, process-control devices and laboratory instruments—all rely on clean, continuous power.

Elgar has the solution—an Uninterruptible Power System (UPS) that provides total protection against out-of-the-ordinary power conditions for your AC line. In addition to blackout protection, an on-line UPS constantly filters the utility and regulates the output voltage, eliminating virtually every power line problem without interruption or switching.

Available in models ranging from 400 VA to 25 kVA single-phase and 10 to 50 kVA three-phase. Elgar UPS feature full kVA load rating from 0.7 lagging to 0.9 leading P.F. All three-phase and single-phase units rated 15 kVA and higher include a full electronic static switch as a standard feature. Other models are available with the static switch as an option.

Elgar can deliver the right system for you—from the Mini-UPS, designed primarily for low power applications such as microprocessor-based systems, data acquisition equipment and smaller microcomputers—to the large 50 kVA UPS employed with large data processing equipment or other sensitive systems.

To put it simply, when you order a UPS from Elgar, we'll deliver complete, continuous power from clean-up to back-up—and a much rarer commodity: peace of mind.

This sight strikes terror in the hearts of all computers.

AUUA meet to be held in Nashville

NASHVILLE — More than 90 work sessions are being planned for the four-day spring conference of the American Unibank Users Association, Inc. (AUUA), which will be held at the Hyatt Regency here March 19-22.

AUUA is a group of about 1,000 computer user companies throughout the U.S. and Canada that holds semiannual conferences for the purpose of exchanging information in the data processing field.

A keynote speaker has yet to be announced, but common interest groups — education, management "game plans," state and government — and product line groups will be featured.

The conference registration fee is $150 before March 5 and $180 after that date. More information is available from Gail DeLaurier, Small Business Administration, 5906 Bedford Lane, Clinton, Md. 20735.

ACM meet scheduled

CHICAGO — The Association for Computing Machinery's (ACM) North Central Regional Conference on March 22-23 will focus on strategies for integrating microcomputers and mainframes in a work setting. Hosted by the Chicago Chapter of ACM, the conference will be held at the Midland Hotel in downtown Chicago.

Cost of registration is $300. More information is available from Sharon Pyrce Kaminecki, Conference Chairwoman, North Central ACM '84, P.O. Box 2381, Chicago, Ill. 60690.

"IDMS/R represents a major advance in database technology."

Dave Litwack*

David Litwack is Cullinet's Vice President of Product Development. Mr. Litwack has contributed significantly to the many technical advances Cullinet has achieved in database software products, including IDMS/R. Mr. Litwack joined Cullinet in 1976. He is a Cum Laude graduate of Brandeis University and holds a Masters in Computer Science from Boston University.

Because IDMS/R is the first relational DBMS designed for both the DP professional and the end user.

IDMS/R is not only a relational database management system, but a particularly powerful one. IDMS was made relational by removing all pointers and allowing the user to define data as tables and providing the traditional relational operators such as selects, projects and joins. The major benefit of a relational DBMS is the capacity to develop applications faster because the developer does not have to be concerned with the database design. IDMS/R provides this and much more.

For example, the Automatic System Facility (ASF) of IDMS/R is a major advance over fourth generation languages. The ASF is so comprehensive and easy to use that all a user need do, to develop an application, is define a relational record. The Automatic System Facility dynamically generates all necessary supporting structures including data definitions, screen formats, application processing logic, and documentation. So, the developer can witness the application being produced, literally, in seconds. This capability makes IDMS/R the perfect system for the end user.

Data processing professionals can use the ASF to help develop production applications. The ASF can be used to build a prototype that can be enhanced, using Cullinet's fourth generation language, ADS/OnLine, into a complex production application. But, when they build a complex high volume application using IDMS/R, DP professionals require outstanding performance. Typically, 5% of the data relationships (joins) in any application are accessed 95% of the time. With IDMS/R, they can simply change these relationships to predefined joins and benefit from a dramatic boost in performance. We call it Relational Fastpath. Relational Fastpath makes IDMS/R a unique DBMS and a perfect system for DP professional's system development needs.

In addition, IDMS/R has the most sophisticated back-up and recovery capability of any DBMS, full integration with personal computers and is also integrated with Cullinet's complete line of financial and manufacturing applications.

In summary, IDMS/R was designed to satisfy the requirements of those who want to develop applications faster and those who have the responsibility of processing them.

For further information, attend a Cullinet Seminar. Mail the attached coupon or call the Cullinet Seminar Center at 1-800-225-9930 (in Massachusetts, 617-329-7700).

TURNAROUND TIME

LARRY LONG

Q I've been unhappy in my current position for the last two years. However, I've been reluctant to seek another job, primarily because of the cost of relocating.

I'm gaining good experience, but my current employer is top-heavy. If I stay here, I may never go past project leader.

Now with an upswing in the economy and lower interest rates, I'm feeling more confident about changing jobs. But before I polish up my resume, I would appreciate your thoughts on whether you think this is a good time to enter the job market.

A You are not alone. Thousands of computer professionals have been biding their time until the time is right to seek employment elsewhere. I would not be surprised if one out of five people in the computer career fields changes jobs by the end of the year.

I'm going to step out on a limb and predict a substantial increase in the demand for computer professionals by April or May. It will again be a seller's market for qualified, experienced professionals and to a lesser extent for recent graduates. The seller's market may only last through the summer, but every indicator points to increased activity for this marketplace.

An improved profit picture is causing companies to relieve hiring restrictions that have been in effect for as much as three years. The depressed economy, however, has had little effect on the demand for information services. Managers have continued to demand more and more services, but in many organizations the MIS head count has decreased.

The net effect of this imbalance in demand for services and MIS personnel is that companies are going to have to hire not only for 1984, but for 1982 and 1983. Openings are for new positions and for positions that were vacated and not filled.

Q Our college's development office recently informed us that funds have been made available to purchase 20 personal computers in each of the next two years. A committee of four, which I chair, selected the [name omitted] personal computer because it offered more memory and cost less than the other four micros evaluated.

Several department chairmen, the director of admissions and now the president of the college have expressed concern over our decision. They feel that we should have selected the IBM Personal Computer or one that is compatible with it.

If we order the personal computer we selected, we can get 20% more personal computer than if we ordered the IBM machine. The administration will not stand in our way, but do you think the extra hardware is worth the possible repercussions?

A I do not make hardware decisions in this column, but I will highlight a few points for your consideration.

One has only to pick up the latest business or computer periodical to get a feel for the enormous impact of the IBM Personal Computer. To a great extent, its success has stifled entrepreneurial innovation. Even major manufacturers are producing or planning to produce microcomputers that are, to varying degrees, compatible with the Personal Computer.

Like the hula hoop and pet rocks, the IBM Personal Computer is a phenomenon. This is reality. IBM has publicly announced its intention to increase substantially production of the machine. Also, the number of IBM-compatible personal computers is growing.

From a practical standpoint, I cannot help but share the concern of your college administrators. You must weigh the value of the additional hardware against the probability that your students will see either an IBM Personal Computer or a lookalike when they graduate.

Q I have 10 years of hands-on computer training and am solely responsible for processing and maintaining a utility billing and a payroll system. I had three days of on-the-job training and attended three week-long training seminars. I have not attended college, but I am definitely interested in both broadening my computer skills and in companies interested in helping me do so.

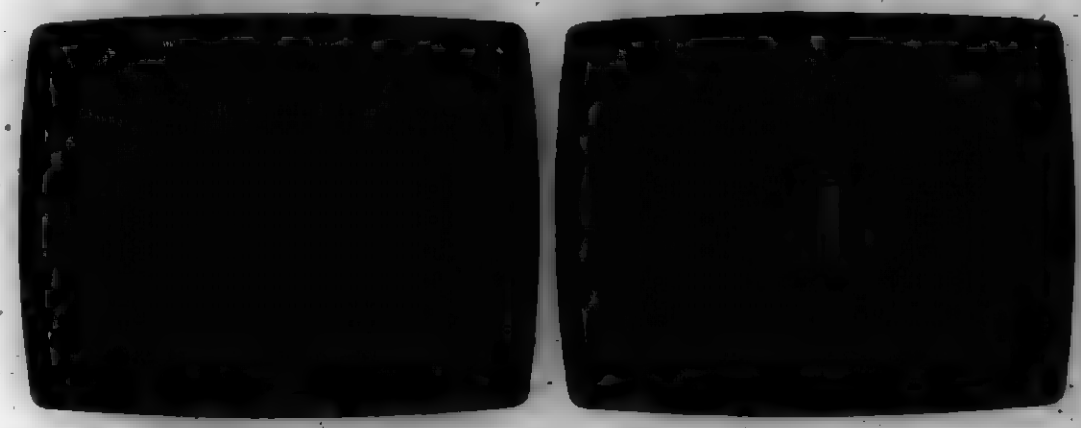
Would I be considered experienced? Do I have management potential? Are there companies out there looking for me?

A Certainly you have experience and, perhaps, even management potential. But realistically, in today's competitive environment, you will need a degree to leverage your experience into more advanced positions.

Data processing and computer science have become glamour careers and lured tens of thousands of people into degree programs. This dramatic increase in the number of people holding computer-related degrees has almost made possessing some kind of degree a requirement for DP management positions.

Long, president of Long and Associates, is a consultant, lecturer and author in the field of information services. If you have a question you'd like him to address, send it to Larry Long, Editorial Department, Computerworld, P.O. Box 880, Framingham, Mass. 01701.

INTELLECT.
NO SOONER SAID
THAN DONE.



To use INTELLECT, the natural language query system, all you have to do is ask—in everyday conversational English—and you'll retrieve. Immediately, in either text or full-color graphics.

INTELLECT, the world's only successful true natural-language query system, is an ideal tool for your information center. INTELLECT's powerful information retrieval capabilities are so advanced that it understands questions and responds with answers as if you were talking to a knowledgeable colleague. Executives access data themselves—more easily than ever before—without learning any technical jargon or "computerese." It's so easy to use, it doesn't even have a training manual!

Whether you use INTELLECT as a retrieval system or as an effective data analysis tool, it transforms raw data in the data base into information and presents it in finished color graphics in a matter of seconds. It's a live, dynamic interface that fully integrates your existing database and graphic systems.

Already hard at work in hundreds of organizations, INTELLECT is ideal for marketing, finance, personnel, manufacturing, and banking applications.

INTELLECT is an important technological breakthrough. You can learn more about it by attending one of our nationwide seminars. Or put its amazing power at your fingertips in minutes with one of our demonstration tapes.

Call or send coupon for more details. Look into INTELLECT, and be an eyewitness to the future of computing.

Taiwan court sentences six for 'bad Apples'

By Patricia Keefe
CW Staff

TAIPEI, Taiwan — A court here has sentenced six computer executives to eight-month prison terms for copying Apple Computer, Inc. software, the first such victory for Apple in its bid to halt the proliferation here of "bad Apples" — pirated copies of its products.

Moreover, the ruling marks the first time computer piracy has been punished with jail terms in Taiwan, according to Apple attorney Jeffrey Blatt, an attorney with the Beverly Hills copyright and patent firm of Brealkley, Sokoloss, Taylor & Zafman.

It has been a busy year in the courts for Apple. Overall, the microcomputer maker has filed about 35 copyright and patent-infringement suits around the world, eight of which have resulted in criminal cases in foreign courts, Blatt said.

Those eight cases resulted in suspended sentences, which is very common in these cases, even in the U.S., according to Edward Taylor, a principal with the Beverly Hills firm. Although there are a "whole slew of companies" that have filed copyright and patent-infringement suits in Taiwan, Taylor believes Apple is the only computer manufacturer.

Customs' Bipolar

In addition to Apple's vigilance, the U.S. Customs Office has seized more than 2,000 ersatz Apples for copyright and patent violations under its Tripwire operation to combat fraud.

The six executives, all from different companies, were convicted in district court here of illegally copying two copyrighted programs for the Apple II: Auto-Start ROM [read-only memory] and Applesoft Basic.

Convicted were Kuo Chung-tin, general manager of Pison Science Technique Co.; Lei Yun-su, president of Lei-Ming Enterprises Co.; Liao Tseng-iu, general manager of Apollo Computer Co., which has no connection to the Chelmsford, Mass.-based company of the same name; Charles Chen, general manager of Sound Electronics Co.; John Lee, manager of IDA Computer Co.; and Lee Shian-yi, president of Main City Enterprise Co.

Some of the defendants plan to file appeals. Until the outcome of those appeals, the six defendants reportedly have ceased marketing machines that resemble Apple's.

There appears to be some confusion over Taiwan's copyright laws, last updated in 1964, years before the arrival of the computer piracy issue. Questions have been raised about whether Taiwan's copyright laws cover software, programs or data for computers.

Some attorneys here believe that Taiwan's copyright provisions protect printed words only. It is on this basis that at least one of those convicted is said to be basing his appeal.

Draft revisions to Taiwan's copyright laws covering software are under consideration by Taiwan's legislature. The revisions reportedly protect software as a literary work, and at least one member of the Interior Ministry's copyright committee has been quoted as saying he considers software a literary work. Moreover, the ministry is said to have granted as many as 20 foreign and domestic companies software copyrights despite the lack of an "express provision" of the law.

The Taiwan government has become more responsive to this issue for a number of reasons, Taylor said. "First of all, it doesn't help their image very much. They want to build a computer industry, but not one built on copies."

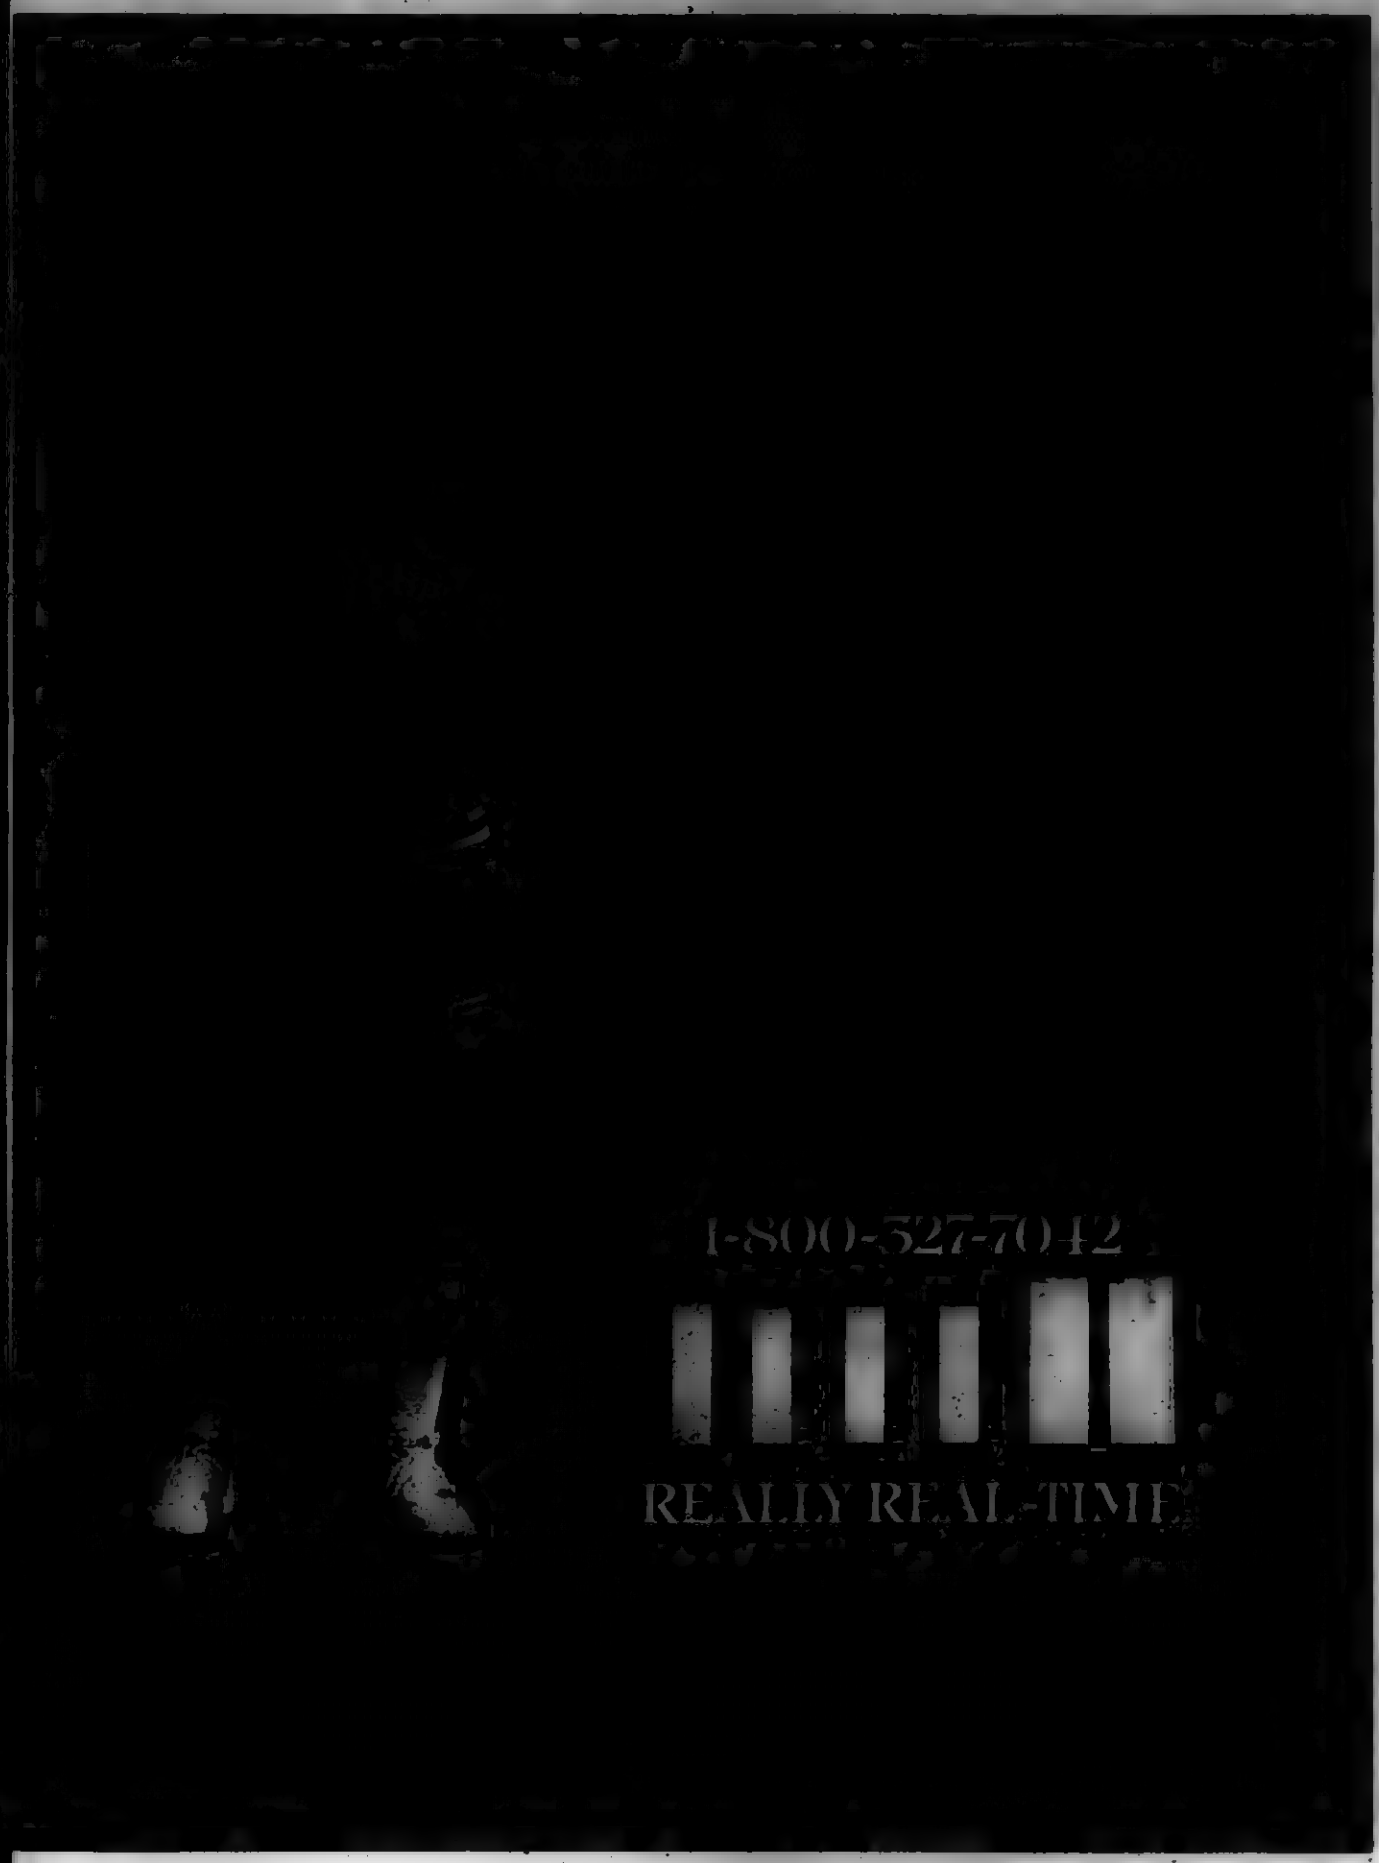
INTERNATIONAL REPORT

AUSTRALIA

MELBOURNE — The Australian and New Zealand Banking Group (ANZ) recently followed Westpac's lead toward a cashless society when it purchased a 32-bit Tandem Computer, Inc. TXP processor for the development of its own electronic funds transfer system. The Tandem machine, believed to have cost over $450,000, will initially front-end ANZ's two IBM 3081 mainframes.

CLAYTON — Monash University is seeking a company to manufacture and market commercially its custom-made local-area network system called Monet. A university source said Monet interconnects 450 IBM 3270 terminals and 150 computer ports on 14 Digital Equipment Corp. VAX-11 superminis equipped with IBM's Systems Network Architecture/Synchronous Data Link Control.

CROWS NEST — Several newer and cheaper data base management systems outperform older and costlier systems in terms of efficiency, flexibility and ease of use. This was the response from a recent survey of Australian users. The product which scored the highest marks was Sir/DBMS from Sir Australia Pty. Ltd., which runs on IBM and IBM-compatible machines. Sir/DBMS received higher marks from users than IBM's own IMS and it costs less than IMS.



FRANCE

PARIS — The urgent need for telecommunications standards in Europe was recognized here by the directors of the European Postal and Telephone Administration last month. The directors acknowledged that the telecommunications and data processing industries are merging, and common standards are crucial to enable European manufacturers to compete with American giants such as AT&T and IBM.

PARIS — In the wake of Apple Computer, Inc.'s Macintosh announcement, retailers and distributors here have said IBM will soon cut Personal Computer prices for big customers by 7%. The Personal Computer distributors, which number about 130 (Apple has 350), speculate that IBM will rebound during 1984 with introductions of a portable microcomputer, a microcomputer based on Intel Corp.'s IAPX 286 and a multiuser system.

JAPAN

TOKYO — A color television/microcomputer called Paxon has been unveiled here by General Corp., a medium-scale integrated manufacturer of electrical appliances. The machine is said to run under the MSX Basic operating system and feature a 2,000-char. display screen. Pricing on the system starts at $544. The keyboard is sold separately at a cost of $78.

TOKYO — Sord Computer Corp. has released a textbook-size microcomputer called The Success, which comes equipped with Sord's Integrated Software System. The software features an English-word processor, communications capabilities, a calculator and Sord's I-Pips programming language. The system's 32K-byte memory is expandable to 64K bytes. Options include microcassette data recorders, a thermal printer and a bar-code reader. The Success costs $761, the vendor said, and will be marketed in the U.S. as well as in Japan.

WEST GERMANY

LUDWIGSHAFEN — Industry watchers here maintain that manufacturers of IBM plug-compatible machines and its close competitors are gearing up to fight IBM in the mid-range computer arena. Burroughs GmbH's A-Series is thought to be a strong rival for IBM's 4361/4381 systems, and BASF recently introduced two models (7/71 and 7/72), which are based on Hitachi Ltd.'s M 260 machine.

IEEE offers job bank service

WASHINGTON, D.C. — The U.S. Activities Board (Usab) of the Institute of Electrical and Electronics Engineers (IEEE) has announced a service designed to help members find employment.

The Professional Engineering Employment Registry (Peer) allows members to place their resumes in a data base that employers with job openings can examine for candidates.

There is no charge to the applicant for the employment service, according to Richard J. Backe, employment assistant task force chairman for Usab.

Peer is operated on behalf of IEEE by Jobnet, Inc., a Massachusetts firm, Backe maintained.

Peer applications and further information for IEEE members and employers are available from Peer, which is located at Suite 608, IEEE Washington Office, 1111 19th St. N.W., Washington, D.C. 20036.

Asis seeks candidates

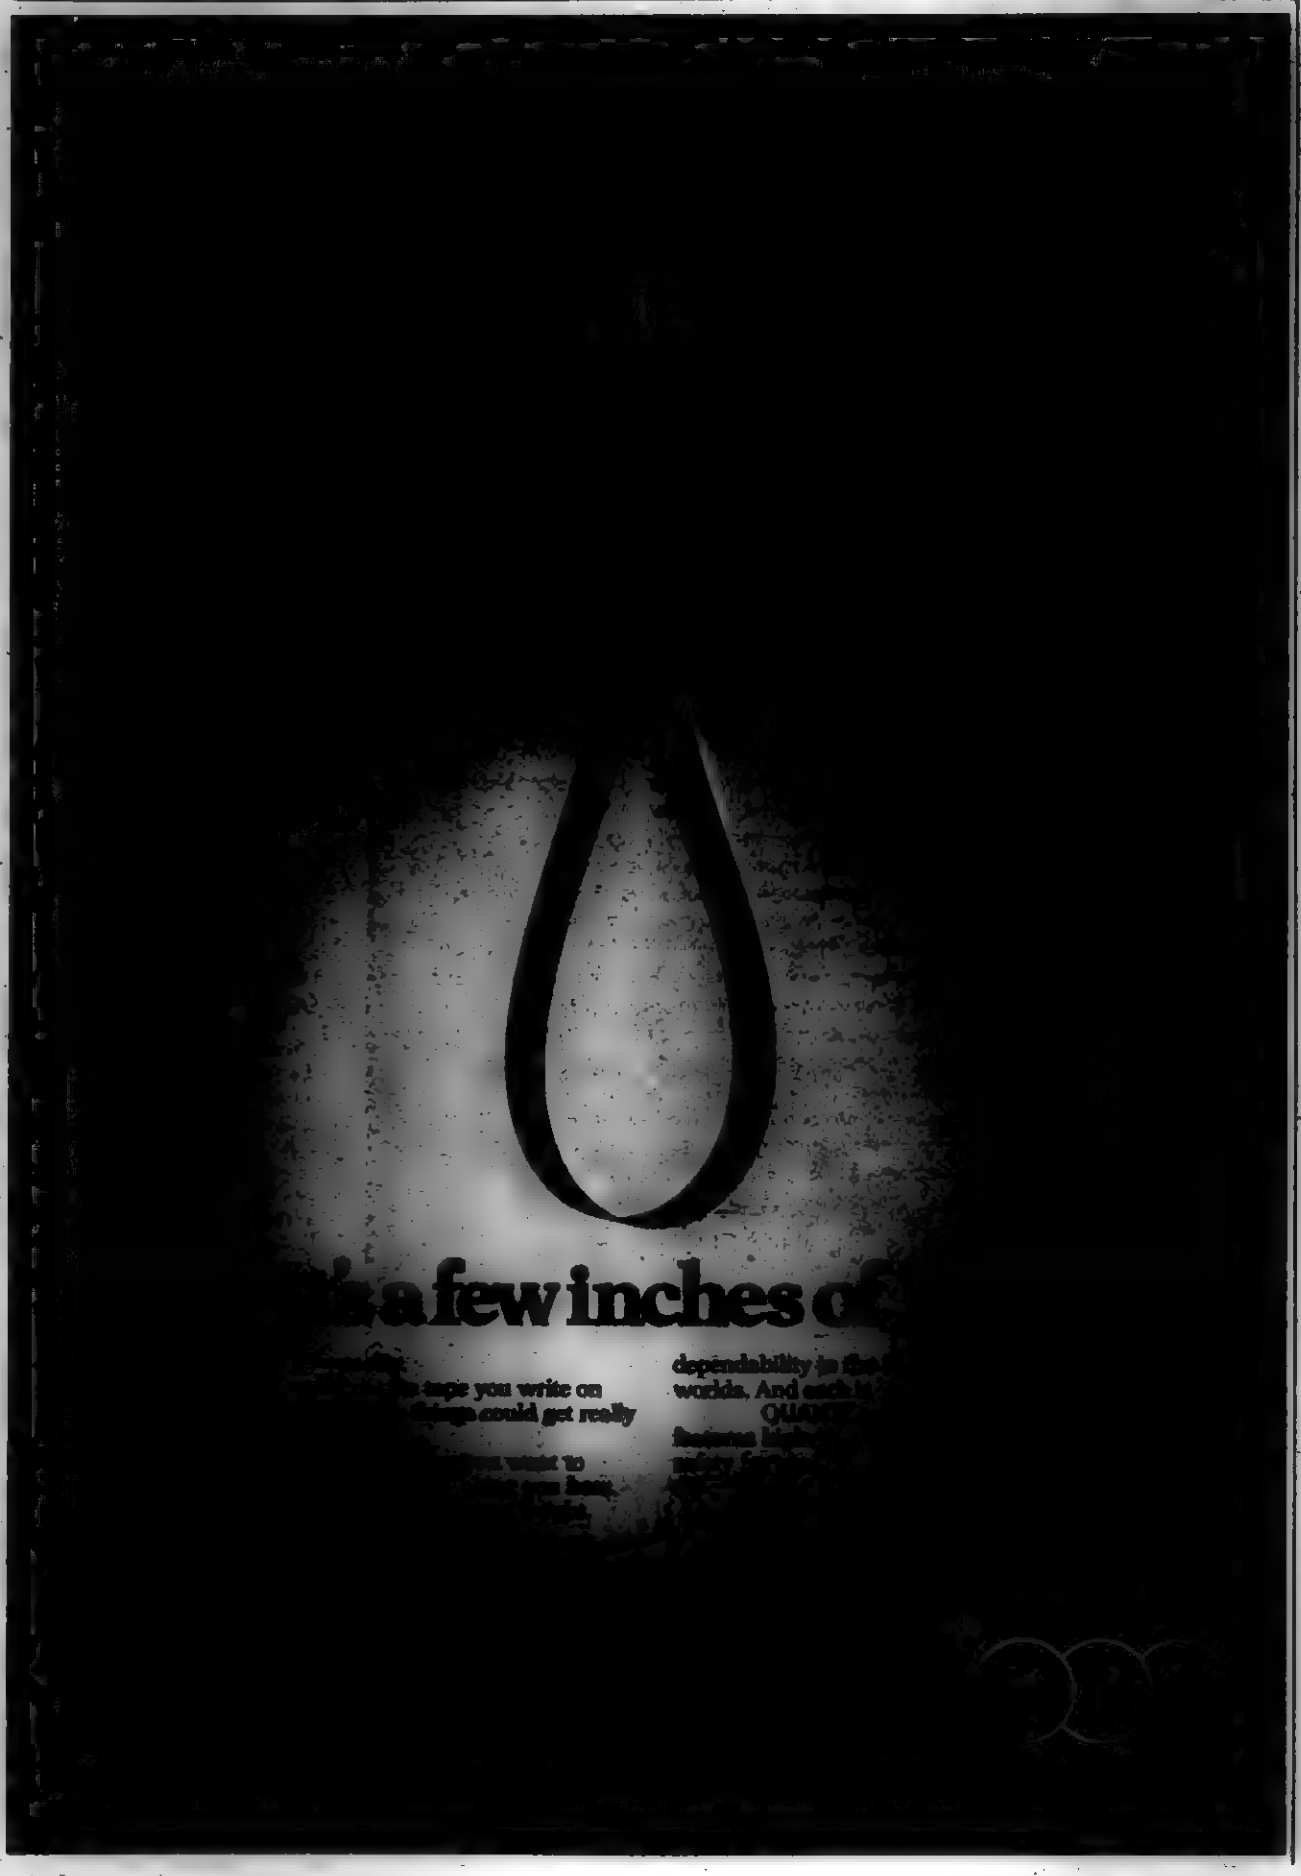
WASHINGTON, D.C.— The American Society for Information Science (Asis) is accepting nominations for three annual awards: the Institute for Scientific Information (ISI) Dissertation Scholarship Award, Student Paper Contest Award and Outstanding Teacher Award. Asis plans to present the awards during its annual meeting, scheduled Oct. 21-26 in Philadelphia.

The $1,000 ISI Dissertation Scholarship Award is given to an active doctoral candidate in an information science, degree-granting institution. The candidate must have completed course work and had a dissertation proposal accepted by the institution. Candidates should submit a description of the research, a schedule for completion, a budget, a list of financial support, names of dissertation adviser and committee members and a cover letter from the adviser endorsing the proposal. Nominations must be submitted by July 1.

Asis plans to award round-trip travel expenses and registration fee for its annual meeting to the Student Paper Contest Award winner. Any student not in a doctoral program is eligible; papers must be endorsed by a faculty member and submitted by June 15.

The Outstanding Science Teacher Award will be presented to a teacher who has demonstrated sustained excellence in teaching information science. Candidates who teach an information science topic on a continuing basis in an academic or nonacademic setting are eligible for the $500 award. Deadline for filing nominations is June 15.

Nominations should be submitted to Betty Foley, Asis Headquarters, 1010 16th St., Washington, D.C. 20036.



'VDT News' published

NEW YORK — The first issue of "VDT News," a newsletter that examines the health and safety risks associated with video display terminals, was published last month by "Microwave News," a publication that reports on non-ionizing radiation.

The bimonthly newsletter will examine health problems, such as eye strain, back and neck aches, radiation-induced cataracts, miscarriages and fetal abnormalities, according to the publisher.

"There is need among employees and employers to understand better the possible health risks linked to VDTs," Louis Slesin, "VDT News" publisher, said.

A one-year subscription costs $18 for individuals and $35 for institutions through P.O. Box 1799, Grand Central Station, New York, N.Y. 10163.

[illegible] yes

Candle knows that when a business depends upon its IMS online system, that business is also vulnerable to the problems within that system.

[illegible]

[illegible]

[illegible]

[illegible]

For a graphic view of your response time, RTA/IMS features Moving Time Slot Analysis. RTA/IMS "Fixed Window" will continuously monitor the 10-minute response history for the transactions selected, whether or not the "Response Threshold" has been crossed. For dynamic warning of problem transactions, RTA/IMS' "Dynamic Window" will display the 10-minute response graph only if the response time for the selected transaction has exceeded your acceptable response time level.

To recognize impending problems by spotting short-term trends, Time Interval Analysis presents response times for three distinct intervals such as 5, 15 or 30 minutes. To determine what your

RTA/IMS Moving Time Slot Analysis displays "Fixed Window" (right side of screen) and "Dynamic Window" (left side of screen).

response time was for transactions at certain periods of the day (ex. 8:00-8:30, 9:30-10:00, 1:00-2:00, etc.), RTA/IMS' Selected Time Slot Analysis will display the response time for your specified transaction – that simple and that easy.

RTA/IMS provides real-time feedback on IMS response times so that you observe short-term trends, receive dynamic warning of performance problems, and thus improve IMS service levels to your end users.

CALENDAR

WEEK OF FEB. 26

FEBRUARY 26-MARCH 2, ANAHEIM, CALIF. — HP 3000 International Users Group's (IUG) Annual European Conference. Contact: Leslie Nicholson, HP 3000 IUG, 2570 W. El Camino Real, Mountain View, Calif. 94040.

FEBRUARY 27, NEW YORK — Introduction to the IBM Personal Computer. Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 7th Ave., New York, N.Y. 10123.

FEBRUARY 27-28, BOSTON — Software Tools for Distributed Support Systems. Contact: Dr. Warren G. Briggs, Suffolk University School of Management, Beacon Hill, Boston, Mass. 02114.

FEBRUARY 27-28, DALLAS — How to Manage Data and Information as a Resource. Contact: Barnett Data Systems, 19 Orchard Way N., Rockville, Md. 20854.

FEBRUARY 27-29, MINNEAPOLIS — Data Communications: Networks Design and Optimization. Contact: Institute for Advanced Technology, 6003 Executive Blvd., Rockville, Md. 20852.

FEBRUARY 27-29, ATLANTA — Microcomputer Data Base Management Systems. Contact: Software Institute of America, 339 Salem St., Wakefield, Mass. 01880.

FEBRUARY 27-29, WASHINGTON, D.C. — Federal Software Procurement. Contact: National Institute for Management Research, P.O. Box 3727, Santa Monica, Calif. 90403.

FEBRUARY 27-29, DENVER — Operations Management and Data Control. Contact: Eric Franks, The Seminar Broker, 3212 W. 133 Ave., Broomfield, Colo. 80020.

FEBRUARY 27-29, SAN FRANCISCO — Managing the Maintenance of Programs and Systems. Contact: Infosci, Inc., Box 7117, Menlo Park, Calif. 94026.

FEBRUARY 27-MARCH 1, SAN FRANCISCO — Compcon '84. Contact: IEEE Computer Society, 10662 Los Vaqueros Circle, Los Alamitos, Calif. 90702.

FEBRUARY 27-March 1, SAN FRANCISCO — Data Base Administration and Control Workshop. Contact: Institute for Advanced Technology, 6003 Executive Blvd., Rockville, Md. 20852.

FEBRUARY 27-March 2, INDIANAPOLIS — Structured Analysis and Design Workshop. Contact: J. Baldwin, Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036.

FEBRUARY 27-MARCH 2, ORLANDO, FLA. — CICS Programming. Contact: Harris Education Center, 6220 S. Orange Blossom Trail, Orlando, Fla. 32809.

FEBRUARY 27-MARCH 2, NEW YORK — CICS/VS Command-Level Debugging. Contact: Taitech, 39 Broadway, New York, N.Y. 10006.

FEBRUARY 27-MARCH 2, NEW YORK — CICS/Command. Contact: Comped Technical Corp., 10 E. 21st St., New York, N.Y. 10010.

FEBRUARY 27-MARCH 2, HOUSTON — Structured Analysis and Systems Specification Workshop. Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036. Also being held Feb. 27-March 2 in Philadelphia.

FEBRUARY 27-MARCH 2, PHOENIX — Structured Analysis for Real-Time Systems. Contact: Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036.

FEBRUARY 27-MARCH 2, BOSTON — CICS/VS Internals. Contact: On-Line Software International, Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024.

FEBRUARY 27-MARCH 2, NEW YORK — CICS/ Testing and Debugging. Contact: Comped Technical Corp., 10 E. 21st St., New York, N.Y. 10010.

FEBRUARY 27-MARCH 2, ATLANTA — Systems Analysis and Design. Contact: Institute for Advanced Technology, 6003 Executive Blvd., Rockville, Md. 20852.

MARCH 1, NEW YORK — PC-DOS 2.0. Contact: Center for Advanced Data Processing, Inc., Suite 402, 450 7th Ave., New York, N.Y. 10123.

MARCH 1, INDIANAPOLIS — Computerized Personnel/Payroll Seminar.

MICRODATA INTRODUCES THE RELATIONAL OFFICE.

IT'S WHERE YOU'VE ALWAYS WANTED TO WORK.

No other 3270 protocol converter can match all these features.

Since 1977, hundreds of companies all over the world including Bell Labs, Citicorp, ITT, Litton, Westinghouse—have used Local Data products to make IBM communications easy and inexpensive.

We believe the DataLynx™/3274 is the best price/performance 3270 protocol converter on the market.

So, before you buy any other protocol converter at any price, compare the DataLynx/3274 features first. Then decide.

- SNA/SDLC or BSC protocols supported. SNA is PU type 2.
- BSC for EBCDIC and ASCII.
- 16 bit, 8 MHZ Intel 8086-2 CPU.
- Auxiliary printer support allows each async port to have a separately addressable 3287 type printer. This feature enables dial users to combine CRT and print data over one dial-up line.
- 80 types of ASCII async display terminals can emulate IBM 3278 display stations, and ASCII async printers to emulate IBM 328X printers.
- Micro to main-frame support with our FileLynx™/3278 program for the IBM PC and PC compatibles supports terminal emulation and file transfer (upload/download).
- Hard copy KSR support with our "Paper/3278."
- Unique "paging" feature supports emulation of *all* models of the 3278 display station.
- Pseudo-transparency feature allows host application to transmit character and control codes to async terminal devices (e.g. graphics terminals, graph plotters, mini-computers, high-speed printers with down-loadable forms control units).
- "Compu" support for micro, mini and instrumentation computers as terminal devices.
- Dual host support.
- PROM cartridge for easy user upgrade of firmware.
- Powerful, friendly configurator mode, using menus to allow parameter definition for sync ports, logical units, async ports and terminal characteristics, including help utility.
- Configuration values saved in non-volatile EEPROM.
- Monitor mode displays current status of all ports and logical units.
- May be connected to a host directly (in modem eliminator mode), or via modems on a dedicated multipoint or point-to-point line (dial-up or dedicated), via RS-232C sync ports.
- Data rates to 19,200 bps (sync & async).
- Async ports may be configured for any of 15 fixed bit rates or "autobaud", with or without parity checking, and with a specified character format.
- Simple DTE/DCE change on all ports.
- Flow control on async ports may be configured for physical and/or logical signalling.
- Virtual device support enables reconnect of dial users independent of physical port.
- Security through dual level password protection.
- Emulation of standard 3278 keyboard functions is tailored for each supported terminal type.
- 25th status line emulation.
- SAS® graphics support.
- Base color support.
- 3278-5 (27 x 132 character screen) support on 9 channels with memory expansion option.
- LU configurator options provide support for various screen formats and printer page widths.
- Front panel includes 33 function status indicators.
- Self-test of channels, memory and firmware integrity is performed continually in background mode assisted by a "watchdog" timer.
- UL and FCC approved.

For more information about the remarkable DataLynx/3274 protocol converter, call or write today. And ask about our 30-day free trial program.

IN DEPTH

Megatrends

Lessons from the best-sellers

A three-part series

The information systems manager who succeeds in the "megatrend era" will be the one who balances the technical with the behavioral — recognizing employee needs for a high-touch, participatory working environment.

By J. Daniel Couger

We are living in a time of parentheses, according to John Naisbitt, author of the best-seller *Megatrends*. It is the time between eras.

"Amid the sometimes painful and uncertain present, the restructuring of America proceeds unrelentingly," he writes. Nevertheless, "We have not quite left behind the either/or America of the past — centralized, industrialized and economically self-contained. We are clinging to the known past in fear of the unknown future."

Naisbitt's Washington, D.C.-based consulting firm conducts research on social, economic, political and technological movements in the U.S. Among his clients: AT&T, United Technologies Corp., Control Data Corp. and Atlantic Richfield Co.

Megatrends (Warner Books, $17.50; paperback, $8.95) identifies 10 "restructurings" in defining the new society. These trends will significantly affect information systems managers.

I have summarized the Naisbitt book in two categories: 1) macroanalysis — the key points underlying each megatrend and their impact on each of us as members of society and 2) microanalysis — the primary effects on the information systems field. This analysis reveals that for the first time, systems managers have the opportunity to move from a *supportive* role to a *lead* role in taking their companies from the industrial to the information era.

Naisbitt's research group used a trend extrapolation methodology consisting of three components:

1) Content analysis. Based on a technique used by intelligence agencies during World War II, this approach measures the contents of newspapers. About 6,000 newspapers, both U.S. and foreign, are examined each month. Content analysis effectively monitors social change because the news hole is a closed system. When something new is introduced, something else must be omitted.

2) Analysis of activities in bellwether states. In interpreting its research data, the Naisbitt group "learned that there are five states in which most social invention occurs in this country;

Part two

the other 46 are, in effect, followers." The key indicator state is California, with Florida a close second. The other three trend-setting states are Washington, Colorado and Connecticut.

3) **Extrapolation.** "Trends, like horses, are easier to ride in the direction they are already going," Naisbitt says. "You may decide to buck the trend, but it is still helpful to know it is there."

Examining the megatrends

Megatrend No. 1: Although we continue to think we live in an industrial society, we have, in fact, changed to an economy based on the creation of information.

For the first time, our economy is based on a key resource that is not only renewable but self-generating. The telephone, computer and television have merged into an integrated communications system that will fuel the information society the way energy — electric, oil, nuclear — kept the industrial society humming and the way natural power — wind, water and brute force — sustained agricultural society.

For example, between 6,000 and 7,000 scientific articles are written each day. The amount of scientific and technical information now increases 13% per year, which means it doubles every 5½ years. But the rate will soon jump to perhaps 40% per year because of new, more powerful information systems and an increasing population of scientists. That means the data will double every 20 months.

In the information society, we have systematized the production of knowledge and amplified our brainpower. To use an industrial metaphor, we now mass-produce knowledge, and this knowledge is the driving force of our economy.

Computer skills will be needed in up to 75% of all jobs by 1990. Being without computer skills is like wandering around the Library of Congress with all the books arranged at random, with no Dewey decimal system, no card catalog and no friendly librarian to serve your information needs.

Megatrend No. 2: We are moving in the dual direction of high tech/high touch, matching each new technology with a compensatory human response.

When we moved from an agricultural to an industrial society, we moved more industry into our farms. In about 1800, 90% of our population produced 100% of the food. Today, only 3% of the population produces 120% of the food we need.

We will increasingly run our factories with information rather than laborers. Robots will play a big role. Conservative estimates predict that by 1990 we will be producing 17,000 robots per year and that the total robot work force will reach 80,000. Most experts would double those figures.

We must learn to balance technology with human spiritual demands. Indeed, something else has been growing alongside the technological invasion. For example, as hospitals become environments of fluorescent lights, stainless steel and computers, home births are growing more common and an increasing number of chronically ill patients are choosing hospice care. The more technology we introduce into society, the more people will want to be with other people.

Megatrend No. 3: No longer do we have the luxury of operating within an isolated, self-sufficient, national economic system; we must acknowledge that we are a part of a global economy.

Sweden, Denmark, Norway and Switzerland now lead the U.S. in per capita income. Third World nations have entered phenomenal boom cycles. Over the next decade, we will see a number of new "Japans." The 20 fastest growing economies for the period between 1970 and 1977 were all Third World countries. Some were oil-exporting countries — Saudi Arabia and Iran, for instance. But the vast majority were not. Botswana's economy grew at an annual average of 15.8% and South Korea's at nearly 10%. The economic powers of the Third World are growing with purpose and design: South Korea, Taiwan, Brazil and Singapore invested between 25% and 35% of their gross national products in their economies, nearly twice the rate of the U.S..

During the past decade, the Third World has begun to take up most of the world's industrial tasks. By the year 2000, Third World countries will manufacture as much as 30% of the world's goods.

Rather than reinvest in the industries that once made this country, the U.S. must move toward enterprises of the future.

Megatrend No. 4: We are restructuring from a society run by short-term considerations and rewards in favor of dealing with things in much longer time frames.

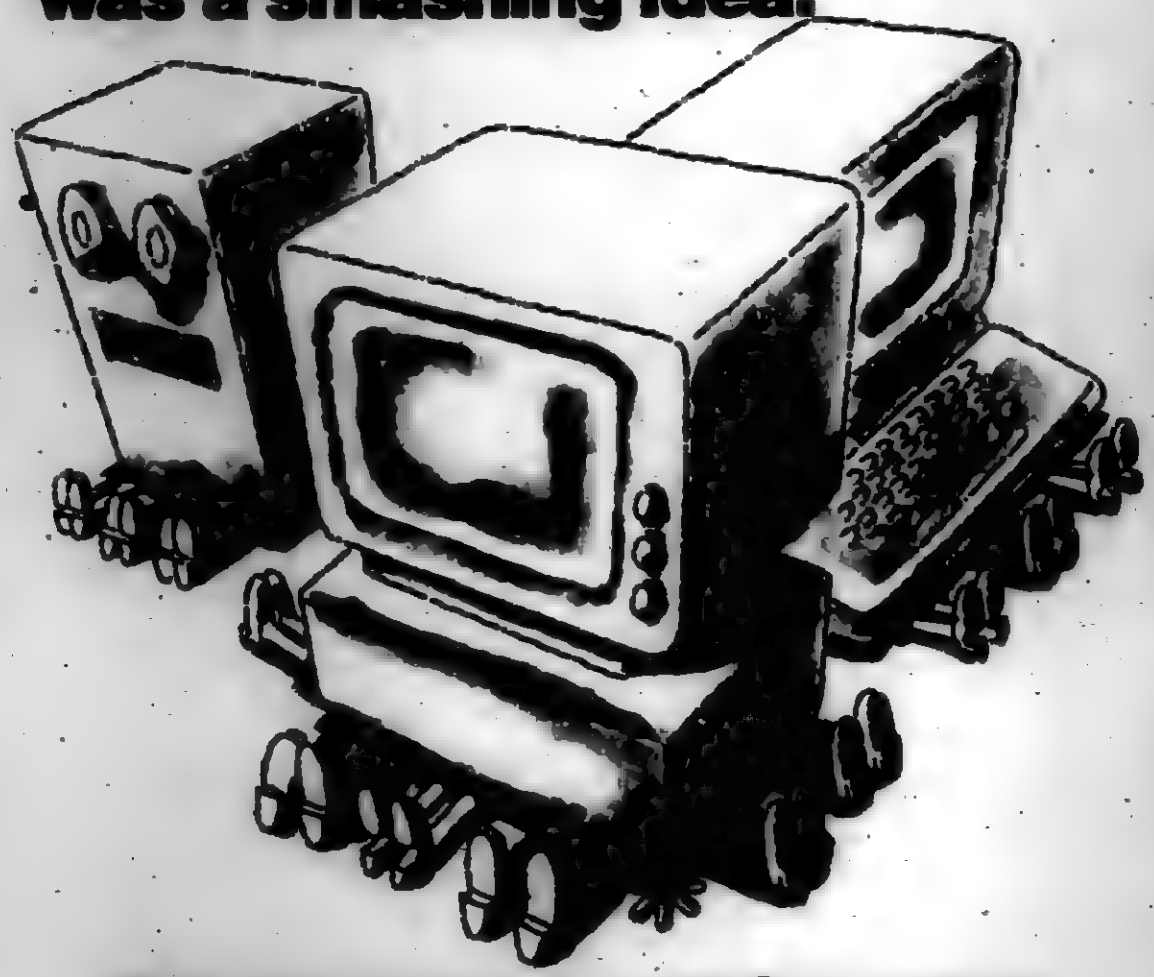
"Get me through the next election or the next board meeting" seems a prevalent attitude, with the result that American government and industry suffer a kind of tunnel vision and find it hard to change.

The criticism about short-term management is becoming widely accepted by the business community itself. Of nearly 1,000 top executives surveyed recently by the Chicago management research firm, Heidrick and Struggles, 76% said there has been a damaging overemphasis on immediate financial goals.

The question for the 1980s is, "What business are you really in?"

Megatrend No. 5: In cities and states, in small organizations and subdivisions, we have rediscovered

Providing your employees with the latest office technology was a smashing idea.



Now you need one solution to keep them on top of it all.

With all the subtlety of a bomb, technology has arrived in your organization. And its effect on productivity can be devastating. Even your most skilled, most motivated employees may be hard-pressed to keep up.

The solution is comprehensive, continuous education and training. And DELTAK, the world leader in training programs and services, can help.

For your DP professionals, there's a wide range of job-specific multimedia and computer-based skills courses. For managers and end users, we offer microcourseware and video briefings covering critical business issues.

And to complete your expanding training needs, DELTAK now provides comprehensive consulting, professional classroom instruction and major city workshops.

So call today and find out how DELTAK can help your people stay on top of some very pressing problems.

DELTAK

the ability to act innovatively and to achieve results from the bottom up.

Our society is converting from centralization to decentralization. Centralized structures are crumbling across our country. But society is not falling apart. People are building the country into a stronger, more balanced, more diverse society. It doesn't matter who is president, and Congress has become obsolete. Local initiatives attract intense political activity, and real political power — that is, the ability to get things done — has shifted to the states, cities, towns and neighborhoods.

Megatrend No. 6: We are shifting from institutional help to more self-reliance in all aspects of our work.

For decades, institutions such as the government, the medical establishment, the corporation and the school system were America's buffers against life's hard realities (the needs for food, housing, health care, education). Slowly we began to wean ourselves from our collective institutional dependence, learning to trust and rely only on ourselves.

In a sense, we have come full circle. We are reclaiming America's traditional sense of self-reliance after four decades of trusting in institutional help. No one believes anymore that institutions can care for us as well as we can do things for ourselves, with the result that we are increasingly disposed to manage our own lives.

Megatrend No. 7: We are discovering that the framework of representative democracy has become obsolete in an era of instantaneously shared information.

Participatory democracy is revolutionizing local politics in America and is bubbling upward to change the course of national government as well. Initiatives and referenda are tools for the new democracy. In 23 states and 100 cities in which initiatives are legal, voter turnout is 20% higher than in states without such voter options.

Political scientist Harlan Cleveland wrote on the power of participatory democracy: "The tidal wave of social change these past 20 years — environmental sensitivity, the demographic transition, civil rights for all races, the enhanced status of women, recognition of rights of consumers and small investors — was not generated by the established leaders, but boiled up from the people at large."

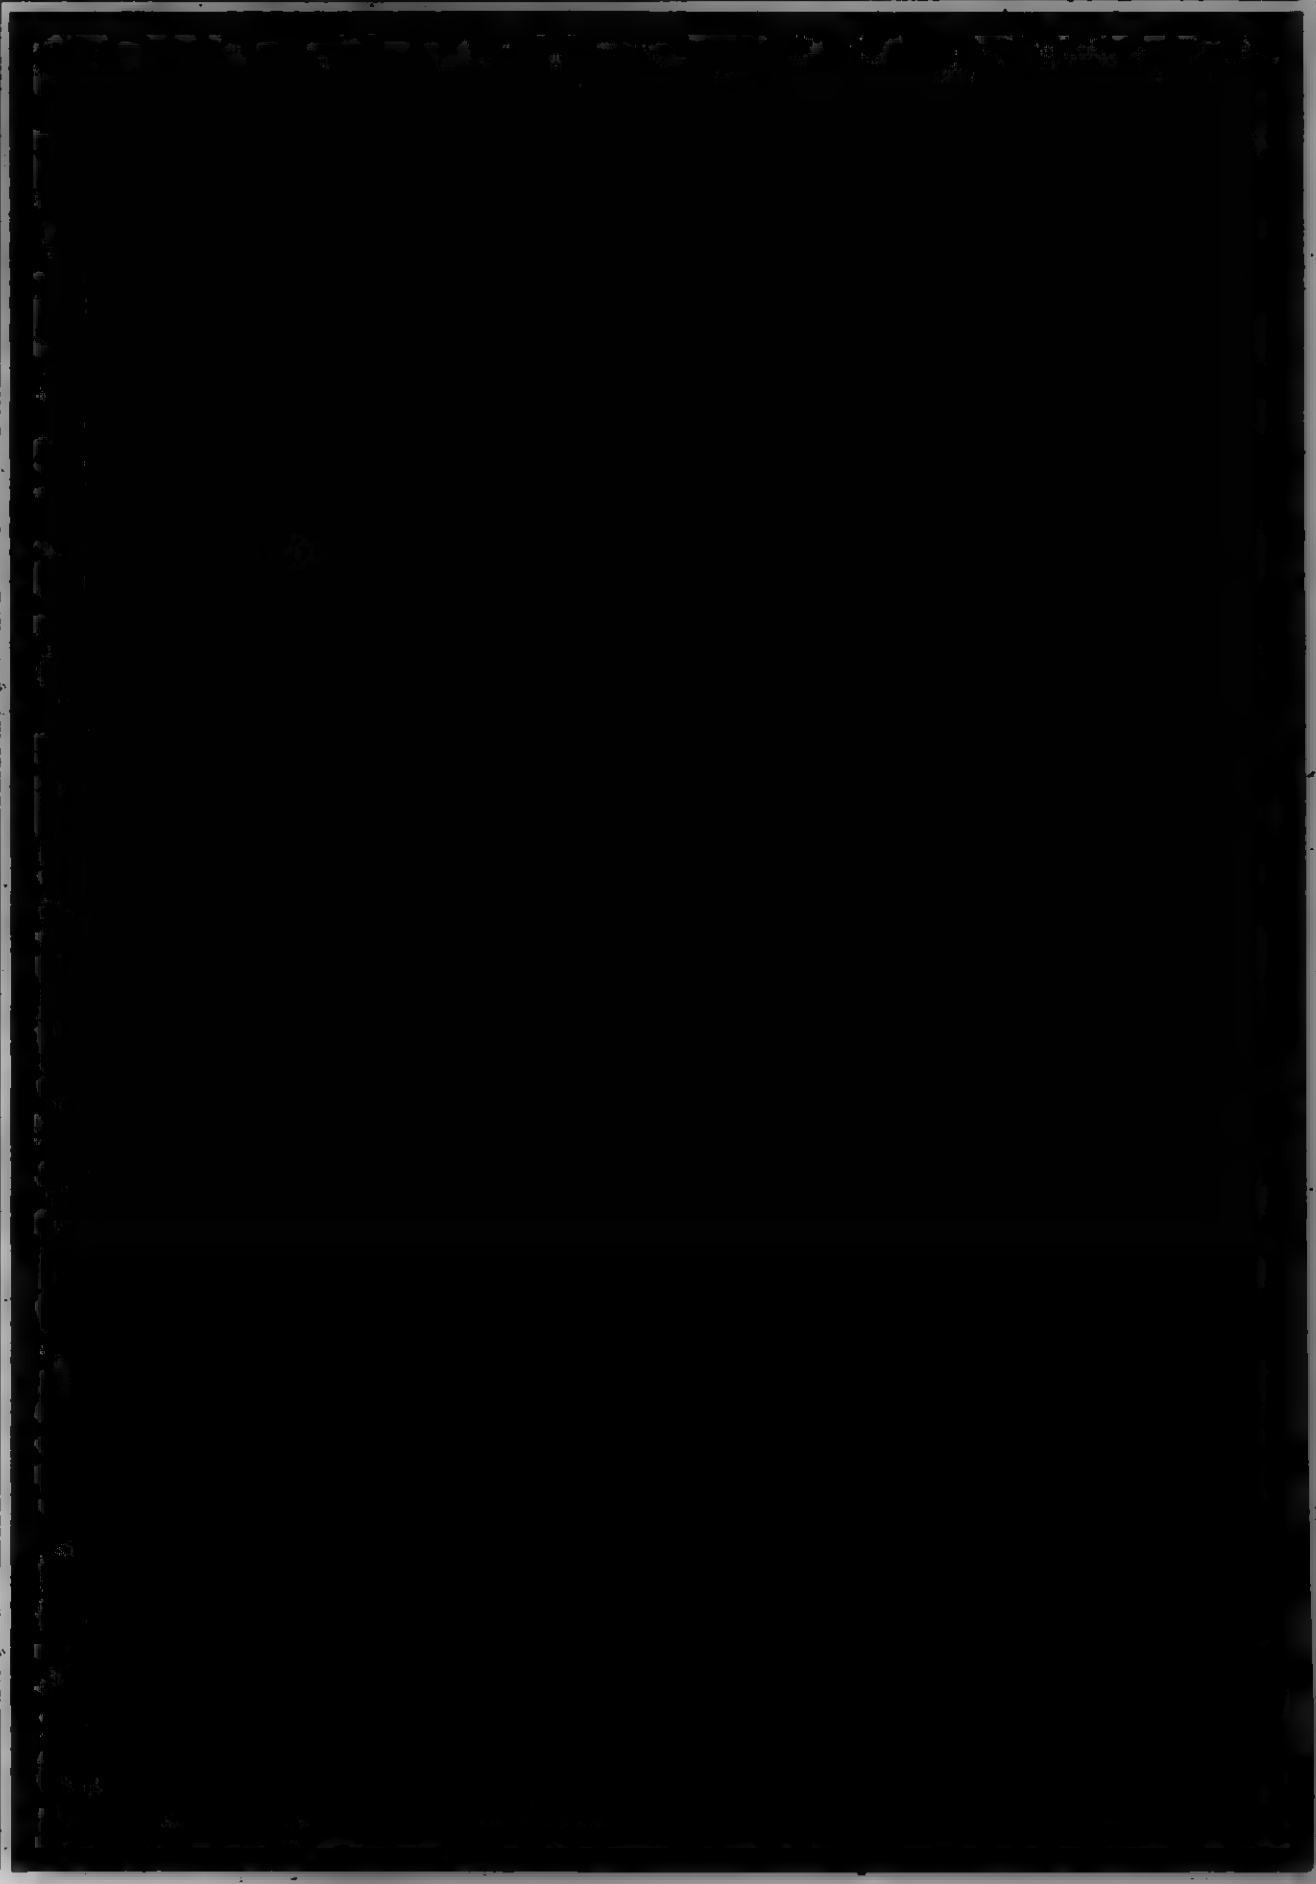
Megatrend No. 8: We are giving up our dependence on hierarchical structures in favor of informal networks.

The pyramidal power structures in which people at the top give the orders are being superseded by networks: people talking to each other, sharing ideas, information and resources. The point is often made that networking is a verb, not a noun. The important part is not the network, the finished product, but the process of getting there — the communication that creates linkages between people and clusters of people.

Vehicles for networking include phone calls, air travel, books, phantom organizations, papers, pamphleteering, photocopying, lectures, workshops, parties, grapevines, mutual friends, summit meetings, coalitions, tapes, newsletters.

"Networks are appropriate sociology — the human equivalent of appropriate technology — providing a form of communication and interaction that is suitable for the energy-scarce, information-rich future of the

Networks offer what bureaucracies can never deliver — the horizontal link. This connection is enormously liberating for individuals. Hierarchies promote moving up and getting ahead, producing stress, tension and anxiety. Networking empowers the individual, and people in networks tend to nurture one another.



GET EVERYBODY ON BOARD.

Now there's a way to let everyone in your company chip in.

AT&T Information Systems, the company whose unparalleled communications heritage has been bringing people together for 100 years, now brings your office together. With state-of-the-art office automation that's designed to get your company moving ahead.

Electronic Document Communications, now available on System 85 and DIMENSION® PBX, is an easy-to-learn software application that's hard to beat. Because it integrates your office by letting everyone prepare, send and store documents and messages with the speed and efficiency of a computer. So you can have better access to the right information in the right form at the right time.

Electronic Document Communications can streamline your office in three ways:

Preparing Information—Reduces the time, effort, cost and wasted paper between drafts by electronically creating, editing and formatting documents and messages. "The Composer," a special software feature, checks spelling, grammar, punctuation and usage. EDC even measures whether documents are readable by technical and nontechnical readers.

Moving Information—Speeds documents to many people in different locations simultaneously so they can act decisively. EDC allows you to determine the timing and cost of delivery, and even check to find out when documents were received. Using a password ensures the privacy of your messages.

Managing and Storing Information—Locates documents, and retrieves and evalu-

ates contents quickly and easily with electronic files—while reducing the possibility of losing documents. An electronic "Mailbox" allows you to quickly determine which documents to read first. EDC reduces storing and filing costs with an electronic "Archives" that allows for either short- or long-term storage, and the "Wastebasket" which enables you to permanently delete items after a determined period of time. There's even an electronic "Calendar" that checks personal schedules and arranges mutually convenient meetings.

Not only will all these features help you further integrate your office, Electronic Document Communications is itself just one part of AT&T's line of completely integrated business systems. For state-of-the-art office automation, you can implement EDC in conjunction with other applications software like Message Center/Directory, a call coverage and message system. These office management applications are now available on System 85 and DIMENSION® 600 and 2000 systems with the Applications Processor.

The result is you'll be able to improve staff productivity at every level and get everybody on board. And as new features are developed in the future, they'll be compatible with your existing equipment.

EDC was developed by Bell Labs systems designers who now work for AT&T Information Systems Laboratories. AT&T Western Electric produces EDC, and AT&T Information Systems will maintain it with comprehensive, conscientious service from the largest service organization in the industry. To find out more, call toll-free 1-800-247-1212, Ext. 879M.

AT&T's Electronic Document Communications: It's part of the integrated office of tomorrow that you can board today.

AT&T Information Systems

1980s and beyond," write Jessica Lipnack and Jeffrey Stamps in *Nose Age*.

Experienced networkers claim they can reach anyone in the world with only six interactions. Naisbitt claims he can reach "anyone in the U.S. with only two — three at the very most — exchanges." Although sharing information and contacts is their main purpose, networks can go beyond the mere transfer of data to the creation and exchange of knowledge. As each person in a network takes in new information, he synthesizes it and comes up with new ideas.

Networks offer what bureaucracies can never deliver — the horizontal link. This connection is enormously liberating for individuals. Hierarchies promote moving up and getting ahead, producing stress, tension and anxiety. Networking empowers the individual, and people in networks tend to nurture one another.

Megatrend No. 9: More Americans are living in the South and West, leaving behind the old industrial cities of the North.

The old economic axis between New York and Chicago is being replaced by a new Los Angeles-and-Houston axis. Perhaps more important than the political or demographic changes is the economic growth that supported and encouraged the population shift.

Two out of three new jobs were created in the Sunbelt or western states between 1968 and 1978. The U.S. Labor Department calculates that the Northeast and Midwest gained only 6.1 million to the South and West's 12.3 million.

Megatrend No. 10: From a narrow either/or society with a limited range of personal choices, we are exploding into a freewheeling multiple-option society.

There are more than 752 models of cars and trucks sold in the U.S.; one store in New York stocks 2,500 types of light bulbs. The basic idea of the multiple-option society has spilled over into other important areas of our lives: religion, the arts, food and, finally, in the extent to which cultural, ethnic and racial diversity are now celebrated in America.

More than ever before, people live alone — one in four is a single-person household, compared with one in 10 in 1955. Single-person households are so numerous that the basic building block of society may become the individual rather than the family.

Effects on MIS

1. Industrial society is becoming an information society. We are drowning in information but starved for knowledge.

This level of information is clearly impossible to handle by present means. Uncontrolled and unorganized information is no longer a resource in an information society. Instead, it becomes the enemy of the information worker. Scientists who are overwhelmed with technical data complain of information pollution and charge that it takes less time to do an experiment than to find out whether or not it has already been done.

Information technology brings order to the chaos of information pollution and, therefore, gives value to data that would otherwise be useless. If users, through information utilities, can locate the information they need, they will pay for it. The emphasis of the whole information society shifts, then, from supply to selection.

This principle is the driving force behind the new electronic publishers who provide on-line data bases, communications channels for sorting and selecting. These new businesses are selling a medium, not information as such.

In an industrial society, the strategic resource is capital; 100 years ago, many people may have known how to build a steel plant, but few could get the money to do it. Consequently, access to the system was limited. But in our new society, as Daniel Bell first pointed out, the strategic resource is information — not the only resource, but the most important. With it, access to the economic system is much easier.

2. Forced technology is becoming high tech/high touch. High-tech robots and high-touch quality circles are moving into our factories at the same time — and the more robots, the more circles.

When high tech and high touch are out of balance, conflict results. Concern about personal privacy erupted just as computer systems became widespread in society.

Whenever institutions introduce new technology to customers or employees, they should build in a high-touch component. If they don't, people will try to create their own or reject the new technology.

3. The national economy is becoming a world economy. We have two economies in the U.S. today: a sunrise economy and a sunset economy.

As the Third World prepares to take over the major industrial tasks, the developed countries must move on to the new enterprises. We are in the midst of doing that right now. In the industrialized nations, we have two separate economies: sunrise and sunset industries. This dual economy has caused much confusion in analyzing our economic situation.

What sort of structural-adjustment policy would work best in this country? Generally speaking, the government should stay out of the way of the sunrise industries (electronics, software, cable television, biotechnology) and allow the mature industries to level off.

MIGRATING TO MVS/XA THIS YEAR?

Don't be a lonely pioneer.

Much has been said about the complexity of the migration to XA. The destination is clear but the route is still hazardous. The good news is that you don't have to "go it alone" any longer. The experiences of others who have blazed the trail before you have been collected by ASI. Benefit from these experiences. Learn while these pioneers tell you where they found problems, and where and how they found the help they needed. They'll also tell you the effort they needed and the resources they used. ASI has a new series of courses available to help you plan your migration and utilize the potential of XA. This resource is available to you today to help in your migration.

ASI's help does not end with the migration. Once you are there, consolidate your position by using the remainder of ASI's vast MVS/XA training curriculum to show your staff how to manipulate and take advantage of this new environment.

For details of our special introductory offer covering "MVS/XA Migration Considerations" and "Harnessing the Productivity Potential of XA" call or write ASI today.

Of course, sunrise industries will not account for all future growth. Established businesses, where we are still competitive and where demand remains strong, will continue to grow: aerospace, all of the information processing and telecommunications industries, health care and medical technology.

Information will be the new economic good, and as of now, at least, the U.S. is the world's leading supplier of information. But America has no manifest destiny to maintain its lead.

Despite some worker opposition, factory automation continues. There are only about 1,000 robots in the U.S. auto industry today, but they

In a constantly changing world, strategic planning is not enough; it becomes planning for its own sake. Strategic planning must be geared to a strategic vision with a clarity that remains in spite of the confusion natural to the first stages of change.

are earning their keep and gaining a reputation for productivity as well. Quality robots that cost $50,000 each can work two shifts a day for eight years. That figures out to about $5 per hour — quite a bit less than the typical $15 per hour for an auto worker's salary and benefits.

Instead of constantly bemoaning the loss of the old industries, we must explore the adventurous new technologies: electronics, biotechnology, alternative energy sources, mining of the seabeds and robotics. Ten years from now, the electronics industry will be bigger than the auto and steel industries are today. The U.S. alone will need a million or more programmers by the end of the decade.

4. Short-term approaches are turning to long-term. We must reconceptualize what business we are in, or conceptualize what business it would be useful for us to think we are in. Furthermore, when the situation is constantly changing, the process of reconceptualization must itself be constant.

The word "process" should be emphasized. It is not something bought from the outside, but something that occurs inside an institution (with influence and instruction from what is going on outside). It is the hard work of colleagues rigorously questioning every aspect of an institution's purpose — and questioning the purpose itself. The purpose must be right, and it must be a shared vision, a strategic vision.

Strategic planning is worthless unless there is first a strategic vision. A strategic vision is a clear image of what you want to achieve, which then organizes and instructs every step toward that goal. The extraordinarily successful strategic vision for the National Aeronautics and Space Administration was, "Put a man on the moon by the end of the decade." That vision gave magnetic direction to the entire organization. Nobody had to be told or reminded of where the organization was going. Contrast the organizing focus of putting a man on the moon by the end of the decade with, "We are going to be the world leader in space exploration."

In a constantly changing world, strategic planning is not enough; it becomes planning for its own sake. Strategic planning must be geared to a strategic vision with a clarity that remains in spite of the confusion natural to the first stages of change.

5. Centralization is giving way to decentralization. By 1976, America's 200th anniversary, we had turned the corner: The growing strength of the decentralization trend surpassed the receding tendency to centralize. Yet the pull of decentralization extends far beyond politics and geography. It is structuring the transformation of social relationships and social institutions as well.

Decentralization creates more opportunities and more choices for individuals. Because business is decentralized, you can find a job close to where you want to live in a rural area — or almost anywhere else. Your home computer and word processor will enable you to work at home in an isolated area if you are one of the few who takes that course. On the other hand, the cities that some leave will become less crowded and more pleasant for the others who stay.

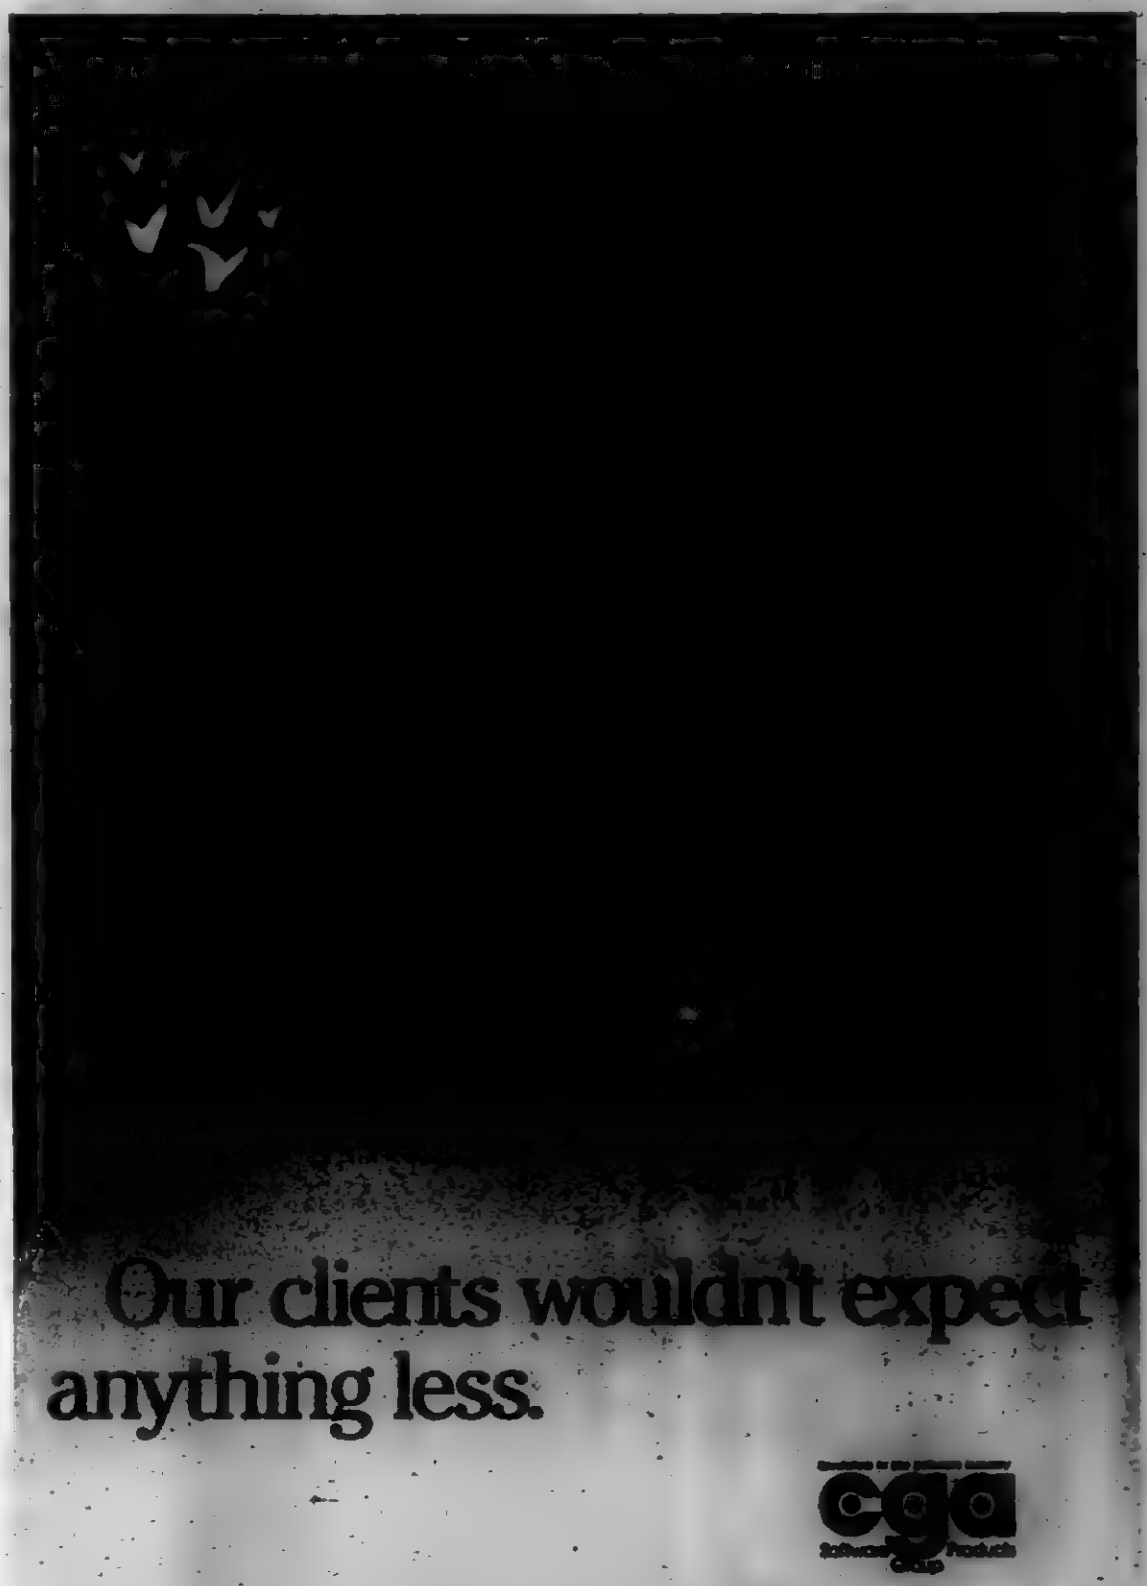
6. Institutional help is being replaced by self-help. The macroeconomics of the industrial-welfare state is yielding to the microeconomics of the information self-help society. We are shifting from a managerial society to an entrepreneurial society.

Somewhere between the shift from institutional help to self-help comes the question, "Can I really do it on my own?" For some people, there is a crisis of confidence, a fear that one is not yet up to the challenge of self-help, perhaps a desire to cling to the comfort of depending on others. Others are very assertive about taking care of things themselves.

Whether we like it or not, self-help fits the political and economic mood of the country.

7. Representative democracy is yielding to participative democracy. The new leader is a facilitator, not an order giver.

Any number of issues can be termed "workers' rights" — privacy, due process (in any dismissal



action), free speech, protection in whistle blowing, participation in management, flexible work contracts, equal pay for work of comparable value or an employee newspaper that is free to take on management. But the first four issues are most readily recognized as crucial. Citizens possess the first three rights outside of work, and people generally agree that it is highly unjust to penalize a worker for speaking out against illegal or immoral behavior on the part of his employer.

The Naisbitt study signals a powerful mismatch between workers and the way they are treated on the job. Now, workers are better educated, more self-confident about governing themselves (in politics and at work) and, consequently, more likely to demand fair treatment. At the same time, they feel they are being treated less fairly than workers in the 1950s.

The need, then, is for leaders (managers) who can facilitate employees' involvement in decision-making processes.

2. Hierarchies are "out," networking "in." Network-style management, now evolving, will be rooted in informality and equality; its communication style will be lateral, diagonal and bottom-up.

From Sweden comes a vision of the future corporation as a confederation or network of entrepreneurs. Employees who function as entrepreneurs are called intrapreneurs by the Foresight Group, which has created a school in Filipstad, Sweden, to teach intrapreneurship to both employees and corporate managers.

The main idea is to reverse the creative inertia in many large corporations by developing the *inside* entrepreneur. The Foresight Group believes there are a lot of good ideas within organizations for new businesses.

The company that can learn how to get people to actualize those ideas will have tapped a gold mine.

Both parties profit: The intrapreneur gets the company's good name, contacts, resources and money. The company keeps a creative person who may otherwise leave to start a new business and gains the potential to develop a profitable new in-house business.

3. The North-South split is presenting a crisis in infrastructure, which will eventually force both North and South to reexamine economic goals and purposes.

For the skilled and the mobile, and especially the young, the cities represent the promise of continued growth and prosperity. But what are the prospects for the unemployed in the North? Moving to the Southwest is an option many have taken. But if a person doesn't want to move, he must adapt by acquiring skills in a sunrise industry operating in his area. Life choices are no longer either/or.

Cities in the North are undergoing dramatic change. Manhattan will continue to be an important information-switching station for the world, while the four boroughs around it

Systems managers have the knowledge and opportunity to assume the key role in facilitating their firms' transitions from the industrial to the information era. They can help management formulate a strategic vision and convert it to a strategic plan.

decline. Lowell, Mass., the birthplace of the industrial revolution in America, has lost its industrial base, but it is today the world headquarters for Wang Laboratories, Inc., one of the leaders in the information society.

4. Either/or society is becoming a multiple-option one. You can tell you are being educated if your options are increasing and that the reverse is happening if they are decreasing.

Similarly, a society can tell it is growing if the options for its citizens are increasing. It is extraordinary for a society as mature as the U.S. to be growing — at least by this measure — so vigorously. Soviet bloc countries are stagnant by comparison.

Much of the multiple-option nature of the U.S. is addressed to our own individuality. We have greater and greater opportunities for self-expression — in education, religion and the arts, in our work as well as in the marketplace.

Information systems managers have the knowledge and the opportunity to assume the key role in facilitating their companies' transitions from the industrial to the information era. They can aid company management in formulating a strategic vision and then converting it to a strategic plan. This effort will be less than successful without equal attention to the other megatrends, such as the behavior consequences of the information era.

About the author

J. Daniel Couger holds the title Distinguished Professor of Computer and Management Science at the University of Colorado, Colorado Springs. He has lectured in more than 50 countries and written 15 books and more than 60 papers.

Prior to his academic appointment, Couger served as a manager in the computer field. In 1977, he was named U.S. Computer Science Man of the Year.

More professionals will attend FOSE '84 than any other office automation conference and exposition in America.

FOSE is the **largest** national office technology conference and exposition in the country – more than 250 exhibitors in 1984.

FOSE is the **most comprehensive** office systems program in the **nation** – over 3 acres of exhibits on **everything** that pertains to the total office environment.

No other office systems conference in the world features more **timely** topics than FOSE – 60 conference sessions, 10 full-day intensives, 100 internationally renowned speakers.

Don't wait. Don't delay. Don't stand in line. New for FOSE '84 is **preregistration.** Send for details on conference sessions plus list of exhibitors or call toll-free

800-638-8510 or 301-459-8383.

KEYNOTE SPEAKERS

John F. Cunningham, President and Chief Operating Officer, Wang Laboratories, Inc. Leader in office automation

Admiral H. G. Rickover, USN ret. Authority on government procurement, father of the nuclear navy.

FOSE HIGHLIGHTS

PC's – comprehensive showing of the latest in personal computers and microcomputer systems and software; day-long PC hands-on sessions for all conference attendees; also for conference attendees only, the opportunity to operate dozens of PC systems in the two day PC Center.

Micrographics, integration strategies, local area networking, telecommunications, and more!

OXFORD JUST TAUGHT CICS to COBOL

UFO/COBOL™ replaces Command Level COBOL with plain vanilla COBOL.

UFO/COBOL is the perfect answer to your procedural on-line programming needs. For the first time, all your COBOL programmers can now develop CICS applications without learning one word of new code. No longer will the lack of specialized Command Level programmers be a barrier to satisfying the growing demand for more on-line applications. Now your present staff can put their ANSI COBOL programming skills to work cutting your backlog of on-line applications…doing it faster, more efficiently, more automatically than ever before.

Without modifying your on-line environment or operating system, UFO/COBOL takes standard COBOL commands, and automatically translates them using a unique COBOL compiler into the language necessary for CICS program execution. Your ability to utilize the substantial benefits of the on-line environment increases enormously, while your programmers continue to write in a familiar and natural way.

An example of UFO/COBOL commands.

In COBOL	In Command level	In UFO/COBOL
DISPLAY (SCREEN-NAME)	EXEC CICS SEND MAP ('XDFHCMA') MAPONLY ERASE END-EXEC.	DISPLAY (SCREEN-NAME)
READ (FILE-NAME)	EXEC CICS READ DATASET ('FILE-NAME') INTO (FILE-NAME) RIDFLD (KEYNUM) END-EXEC.	READ (FILE-NAME)

UFO/COBOL defines CICS 3270 screens on-line.

In addition to extending the capabilities of your programmers, you'll find that UFO/COBOL is a powerful new method to speed-up the CICS application process dramatically. Built into UFO/COBOL is an interactive screen painting facility that lets you design CICS 3270 screens on-line. UFO/PAINT allows you to build or modify screens without writing one line of code. You design the screen simply by positioning fields where you desire. Then COBOL data descriptions are *automatically* generated from the screen.

UFO/COBOL makes prototyping easy.

By quickly defining a sequence of screens, you can prototype the final system…testing and modifying each screen before writing code. You can develop applications interactively with end-users, gaining all the efficiencies of their direct involvement.

Developed by Oxford…#1 in CICS application development.

UFO/COBOL is a development of Oxford Software Corporation, the leading independent supplier of on-line application development software. With more than 1500 installations of UFO…the premier, 4th generation non-procedural approach to application development …no one knows more about the CICS application development environment than Oxford.

If you'd like to learn how you can dramatically add to your on-line development capabilities, using your present programming skills, call in the leader. Call Oxford today at (800) 631-1615.

OXFORD SOFTWARE CORPORATION
174 BOULEVARD/HASBROUCK HEIGHTS, NJ 07604/201 288-4515

☐ I'd like to schedule a UFO/COBOL demo. Please call to set a date.

☐ Please send me literature on UFO/COBOL.

EDITORIAL

No. 2? Stay tuned

If you can't be No. 1, the next best thing is to solidify your position as No. 2. And that is exactly what Apple Computer, Inc. has done.

Everyone knows Apple has a new microcomputer, the Macintosh. And just about everyone also knows that Apple's future as a competitor in the microcomputer business hinges on the Macintosh.

Why? Because for months, in numerous interviews with the media and in its advertising, Apple has been drumming it into our heads.

And the approach has worked. Apple appears to have emerged from the pack of 150-plus microcomputer vendors as *the* challenger to IBM.

But let's put the marketing hype aside for a moment. Most industry watchers agree the microcomputer market is headed for a big shakeout, and vendors that do not offer a unique, identifiable product are clearly headed for trouble.

Amidst this turmoil in the microcomputer industry, Apple has boldly staked its claim as the No. 2 vendor. The move is bold because a year ago Apple's hot new product, the Lisa, flopped. Its critics said the machine was too expensive, too slow and did not offer precious IBM compatibility.

Some critics went so far at the time as to predict Apple's demise. Now, Apple appears to be back in the running with a faster, cheaper version of the Lisa (although, at least for the moment, it still does not offer IBM compatibility).

Why does Apple appear to be a tougher contender today than it was a year ago? Because today Apple is doing a better job of hyping its products — a lesson learned from the master of hype, IBM, which had the industry abuzz over what the Peanut would look like.

But Apple dispensed with the secrecy and told everyone the details of the Macintosh while still maintaining an aura of mystery. Will the Macintosh make it? Will Apple announce IBM compatibility? Will Apple survive?

Those questions may not be answered for a while. Perhaps during next year's Superbowl?

Stay tuned.

LETTERS TO THE EDITOR

Value range not meant to be interpreted as damage claim: IBM

Computerworld's coverage of IBM's settlement with National Semiconductor Corp. and its subsidiary, National Advanced Systems, Inc. ["IBM, NAS settle case," CW, Jan. 16], misleads your readers about damages purportedly sought by IBM.

It is the value to IBM of the trade secrets obtained by National Semiconductor/National Advanced Systems — not IBM's damages — which was estimated to be between $750 million and $2.5 billion.

At no time was that value range meant to be interpreted as a damage claim.

We stated many times — in our amended complaint, in the courtroom and in a press release on Dec. 2, 1983 — that reports of high damage claims were in error.

IBM's primary objective was to obtain the injunctive relief necessary to protect against misappropriation and misuse of IBM trade secrets and confidential information. We stated clearly that the amount of damages was unknown and that if the defendants had not used the information and had not distributed it to others, damages would be minimal, if any.

Big Blue not alone in maintaining compatibility within product line

It was with interest and a discriminating eye that I read your article, "An IBM Look at the History of Computers" [CW, Dec. 26/Jan. 2].

I take strong exception to a statement at the close of the text: "Not coincidentally, the 370 also capped an effort begun with the company's 360 series to make all its equipment compatible — yet another concept that IBM pioneered."

To say that this statement is inaccurate is a kindness. It is, in short, misleading. It leaves the reader with the impression that IBM's product line is compatible between series, when anyone who has gone through the arduous task of conversion can tell you that this simply is not the case.

I know of only one of the major vendors that has maintained compatibility across its line of computer processors, and that vendor is Burroughs Corp., not IBM. Burroughs has not only taken great pains to establish compatibility within its product line, but has also managed to accomplish this same feat within the different generations of its computers.

To imply, therefore, that it is IBM that deserves accolades for this concept is to do a disservice to your readers and to Burroughs.

VIEWPOINT

Pundits and predictions

LECHT ON SCIENCE

CHARLES P. LECHT

Getting the "right stuff" — the lowdown on what's happening in the computer industry, the information needed to create a credible and enduring plan for corporations gone electronic — is becoming increasingly difficult. Without it, planners and management have little hope of controlling their overall operating costs, a growing portion of which is for technology. Where the user community can look to find the right stuff is the subject of today's whimsy.

At the start of each New Year, the business of getting out annual forecasts of computer industry events consumes the time of corporate planners, financial analysts, manufacturers' strategists, research institutions and just about anyone else with crystal balls big enough to dare try to see into our computer future.

Pundits one and all each must vault the abyss between what is and what will be in their annual showpiece forecasts, then live with the reward or shame that these may bring. The former involves praise and money; regarding the latter, a year-long chorus of the hee-haws and cat calls from a balcony of Italian opera critics on hearing the croak of a diva's diving voice just begins to suggest the kind of ridicule possible.

The user/purchasing community is the ultimate benefactor of the accurate results of our pundits but, my friends tell me, these are increasingly useless these days: When our industry analysts reach consensus on a matter, it's usually unimportant; when their opinions are scattered all over the lot, a key issue is invariably involved.

For example, I've seen forecasts of between two and five million personal computers to be sold in 1984 from some highly reputable sources. When the cream of our computer-analyzing community cannot come up with an answer to this question with less than a 150% difference in result, something is amiss. If these figures came out of our purveyor community we might not be so surprised; we are naturally quite skeptical of their prognostications, betting that whatever they may proffer is tarnished by self-interested motives.

But when emanating from the best and brightest of nonaligned analysts, it's rather frightening. A grade-school lab teacher would flunk any student turning in measurements so deviant. And December 1983's sales of home computers and software so far exceeded that forecasted that we can only conclude that when it was made our pundits were out to lunch.

Pundits' fantasies

Divining the business plans of our most successful technology contenders — by deduction or otherwise — must be the objective of every persevering pundit. The megabucks poured into creating these by our industry's preeminent companies frequently exceed the totaled sales of their second-tier competitors. Where can we expect to find better information or more accurate verification than in their own forecasts? But acquiring these legally — that is, through respectable business practice — is nearly impossible. It's no surprise that every pundit worth his salt has fantasies of somehow acquiring the business plans of IBM, AT&T or Motorola, Inc. That is the stuff of which dreams — and fortunes are made.

I stress "legally" because only the Lord knows how many analysts couldn't wait for their dreams to come true and hopped the barrier between ferreting and filching, hoping He wasn't watching. It's ironic that even if our major corporations wanted to give us their plans, the Justice Department and/or the Securities and Exchange Commission would inhibit this by accusing them of "information trafficking," thereby scaring the wits out of loquacious executives who may be willing to spill the beans.

More significant is the fact that the laws of business combat call for the wholesale outwitting of adversaries. These rules include not only secrecy but also the age-old practices of deception through camouflage and other such maneuvers. Thus, even if the right kinds of corporate information were freely issued, we still would have no way of knowing what was truthful.

Now don't misunderstand me; I do not mean to infer that the preponderance of corporate spokesmen routinely and purposefully misrepresent key information or shirk their duty by failing to provide us with the factual basis for believing it.

What I do mean is that today's public pronouncements on important technological issues suffer from increasing obscurity, perhaps the same confusion that characterizes our swiftly changing conception of what constitutes a computer system, be it big or little. My guess is that like most people these days, many analysts are no longer quite so sure. This may help to explain the wide variances in their predictions.

Quixotic quest

Lacking the resources of the big guys or the banditry of the bad guys, most pundits must rely upon their wits to obtain data from documents in the public domain and sources connected with the headquarters of our industry leaders. It is, therefore, not surprising that a typical day in the life of a typical pundit usually involves a quixotic quest for — the right stuff.

"How much was spent on programming in America last year?" a voice asks our typical pundit at 9 a.m. He doesn't know but offers to find out. He phones an analyst friend who promises to get back to him as soon as he calls an associate who's sure to have the answer. Before closing the conversation, the friend asks, rather sheepishly, if he is aware of how many persons programmed at least one line of code in 1983. He doesn't know — or care, for that matter — but he is now obliged to learn.

Our pundit calls a second friend for an answer to the question of the first. The second promises to answer our hero's question that afternoon — after receiving his pledge to obtain the total capacity of computer storage media produced in America between 1975 and 1990.

Now burdened with three unanswered questions, our pundit dials his Penultimate Source who refers him to an Ultimate Source — but only after receiving a commitment to find out whether gallium arsenide technology is becoming more popular

See PUNDITS page 46

Don't let your software get the best of your system

HUMAN CONNECTION

JACK STONE

As it has been all through the computer age, new software continues to open the doors to a world of exciting possibilities for productivity advances, as well as an accompanying galaxy of opportunities for misuse, counterproductivity and excessive costs.

With all the powerful hardware floating around, many tend to forget that the penalties in systems performance that must be endured to support increased functionality of certain software may not justify its acquisition.

This column is intended as a reminder that, in spite of plummeting hardware prices, software efficiency is a subject that cannot be ignored.

Excellent examples of this issue are found in word processing software where software inefficiencies are directly measurable in terms of extended time for hands-on sessions. Take, for example, the "speller" software that's all the rage in office circles.

Let's start with the capability of viewing the context narrative of a mismatch word, that is, one that has no match in the master dictionary. One software package makes it mandatory that the operator view each word in context before selecting a disposition for it. On the face of it, this feature is very impressive, but it turns out that it not only slows down — way down — the spelling analysis, but it is also unnecessary in most cases because the writer/operator usually recalls the narrative from memory.

A better approach, used in several programs, is to make optional both the storage of contextual information during the initial spelling scan of the narrative and its display during the disposition phase of the mismatched words.

Personal dictionary

Another feature of spellers is the personal dictionary, which may be optionally concatenated to the master dictionary. Typical packages allow the operator to dispatch mismatch words directly to the personal dictionary, a choice that seemingly speeds its creation. This option, in my opinion, is a poor choice to select because words assigned to the personal dictionary should not only be carefully checked for spelling errors before their entry but their alternate forms should be probed for in the master dictionary and included in the personal dictionary if necessary — a task that may be time-consuming. The point is that the effort involved in developing the personal dictionary should not be overlooked.

Then there's the "window" fad that's rapidly coming upon us. At first blush, it seems really neat to have "two to eight" files displayed together before your very eyes. However, if you have been fooling around with word processing at all lately, you would know that most of the time you want to devote the entire screen to text for simple entry and edit purposes.

A little experience with Micropro International Corp.'s Wordstar proves this: "Command Help" screens — a rudimentary form of window — occupy a good part of the display and cause considerable increases in scrolling time, plus plenty of distractions from the text edit process; its designers, of course, recognized this and provided commands to suppress the Help screens.

Capacity confusion

And on the subject of Wordstar, one of its prominent features is that a document file is not restricted in size to random-access memory (RAM), but to the capacity of the disk storage. True enough, but what is meant is the "net" capacity of disk storage after allocating space for Wordstar's work files and the document backup file.

Even deleting the backup file, I couldn't save a 150K-byte file on a 256K-byte disk — not enough space. And with this size file and a small RAM, circa 48K bytes for me, I waited seemingly forever to get the cursor to move from the bottom to the top of the file, in stark contrast to the time for movement in a RAM-only file — as designed into certain software — which is negligible.

Software functionality is wonderful: Just be sure you don't forget what you are paying for in terms of systems degradation or development expense.

Letters to Stone should be addressed to him at P.O. Box 33600, Washington, D.C. 20033.

VIEWPOINT

The real strengths of relational systems:

READER'S PLATFORM

E.F. CODD
C.J. DATE

The essence of William H. Inmon's In Depth article "What price relational?" [CW, Nov. 28], Inmon's principal message, in other words, is that "poor performance . . . is inherent to the relational environment." The argument presented in support of this conclusion is that relational systems will be running a mixture of planned transactions and ad hoc queries (short-running activities and long-running activities, to use Inmon's terms), and that those two kinds of activity are mutually disruptive.

Now it is true for any system (not just a relational one) that these two kinds of activity will tend to interfere with each other somewhat, and there is no harm in drawing attention to that fact. But to suggest that relational systems will, therefore, have significantly worse performance than less flexible (hierarchical or network) systems is completely unwarranted for at least the following two reasons:

■ First, it is an apples-and-oranges comparison. It is extremely difficult to perform any kind of ad hoc activity at all on hierarchical and network data bases, with the result that those systems are almost invariably (de facto) devoted to planned activities. This fact does not mean that users would not like to be able to perform ad hoc access to those data bases if they could.

■ Second, there is no requirement to mix the two kinds of activity in a relational system. It is ridiculous to suggest that "no . . . controls are imposed" in the relational environment. Of course such controls can be imposed, if the installation requires them. Even then, if such controls do prove necessary in certain installations, the user will still enjoy all the other advantages of relational technology (ease of use, speed of application development, resilience to change and so on) and in addition will be able to perform ad hoc access at controlled times. Furthermore, there will be many installations where such controls will not be necessary, because the overall performance requirements will be less stringent. Control vs. performance is a trade-off like any other.

Inmon makes a large number of specific but unsubstantiated claims regarding the performance (actual or potential) of relational systems. He says that "a typical relational environment consists of many separate tables, none of which are physically connected," and that therefore the system has to "search for data in diverse places and [has to] construct relationships dynamically."

Such statements demonstrate a thorough confusion between the physical and logical levels of the system. Inmon seems to be unaware of — at least he makes no reference to — the many physical-level (implementation) facilities that have been provided in relational systems specifically for performance reasons. Those facilities include (but are not limited to) the following:

■ Physical data clustering (both intra- and intertable): Tables can be physically connected or stored physically close to one another (even interleaved, as in a hierarchic or network system), if required — but they don't have to be. Note that physically separate tables are actually a better structure (from a performance standpoint) for many applications.

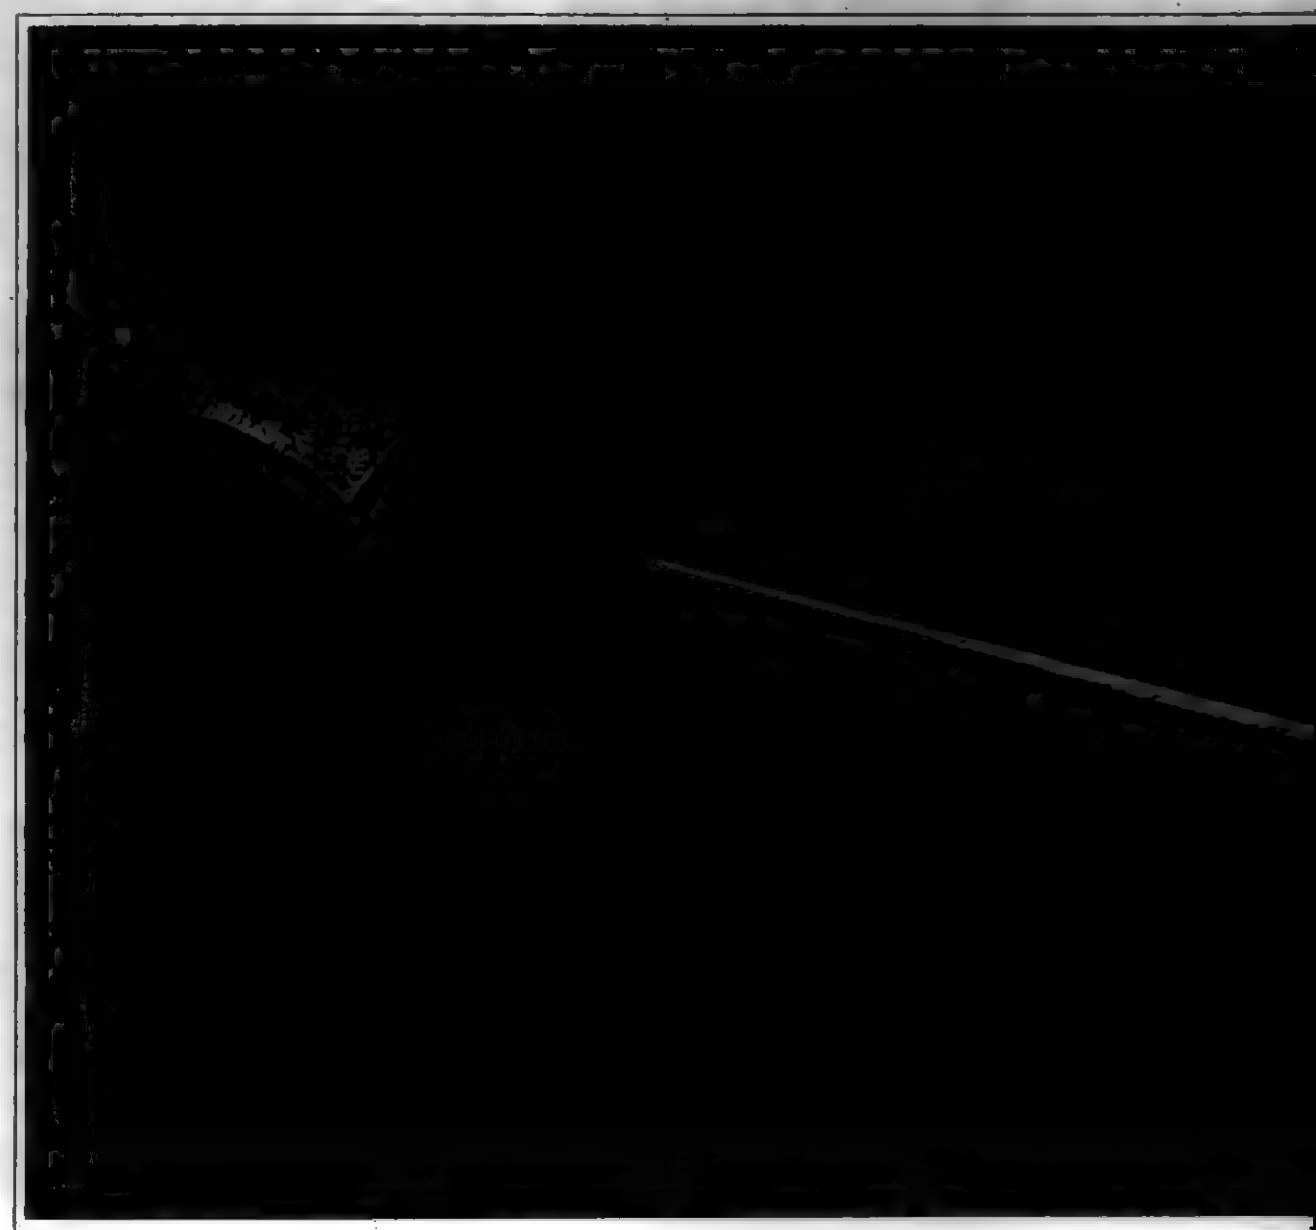
■ The optimization compiler technology pioneered in System R (and subsequently incorporated into the IBM products SQL/DS and DB2) means that a significant portion of the process of "searching for data and constructing relationships" is done statically, instead of dynamically, which thereby reduces the amount of runtime I/O.

■ The provision of indexes and the ability to create and destroy indexes dynamically represent an important aspect of performance that is totally ignored in the article.

There are numerous additional errors of fact and judgment in the article. Some of the more egregious ones are as follows:

■ Inmon states that "resistance to the notion that relational systems do not perform poorly goes back to the relational movement itself . . ." He seems to be saying here that "the relational movement" (whatever that is) has always claimed that relational systems do perform poorly. Surely that cannot be what he meant. More to the point, he goes on to say that "the relational movement is founded in a batch mentality." In fact, exactly the opposite is the case: The original intent was to make the data base directly accessible to *end users* (implying interactive access).

■ "Given the syntax of a language like SQL, it is very difficult, if not impossible, to separate requests" — that is, into long-running vs. short-running — "until runtime." Actually this is untrue, though it is true that systems today do not attempt to make such a separation.



MSA introduces the shortest distance between two points.
New MSA Order Processing.

MSA's remarkable new Order Processing System keeps every order on track and on schedule.

It automatically checks credit and inventory availability. Schedules shipping. Bills customers. Immediately throws a red flag if there's a problem.

Then resumes the process when the problem is resolved.

It's the perfect way to keep your customers satisfied.

Now they won't have to wait while your customer service representative keys in line after line of information. The system automatically displays addresses, preferred shipment and other order-related information.

It also instantly checks current credit records, saving your service representative that time-consuming task.

Customer inquiries are a snap with MSA's

VIEWPOINT

Two experts review the performance issue

■ The "second operating system solution" (involving the temporary removal and subsequent reinstatement of long-running activities) is absurd and would not be worth discussing here at all, were it not for Inmon's final remark to the effect that the notion of "the standard work unit" is "violated at a most basic level by relational systems." This is arrant nonsense, as the most superficial examination of a system such as DB2 (for example) would immediately demonstrate.

■ "In Codd's original specification of the relational environment, it was specified that content-addressable memory be used, rather than conventionally addressable memory." This is completely untrue. There was never any suggestion on the part of either of the undersigned that content-addressable memory was a prerequisite to good relational performance, and the success of modern relational systems (implemented on conventional memories) has shown that indeed it is not.

■ "Much has been said about user satisfaction, nearly all of it at the syntax level." It is absurd to suggest that the many benefits of relational systems — increased productivity, ability to prototype, direct end-user access and so forth — derive exclusively from the syntax of the user language. To take one simple example, the fact that the relational user can dynamically join any number of tables *without having to be aware of the physical representation of those tables in the data base*, which is a significant ease-of-use and productivity factor, is certainly not a question of syntax.

The general tone of Inmon's article is reminiscent of the unfounded criticisms of stored-program computers that appeared when those computers were first under consideration as products. A typical claim at that time was that sorting data on stored-program computers, for example, must inevitably be slower than sorting data using punched-card equipment.

Today, nobody would make any such claim. When a new technology is introduced, there is never any shortage of people ready to decry it; the absence of adequate knowledge of the technology in question does not seem to deter people from making such attacks. If the picture presented in Inmon's article were even close to the truth, is it likely that so many software vendors would be working so hard to provide relational products, and so many users would be so loudly demanding them? ‡

Codd, the original architect of the relational model, is an IBM Fellow in research. Date is an author, lecturer and consultant specializing in relational data base systems.

PUNDITS from page 43

than the Josephson Junction-based stuff for very high-speed integrated circuits.

Phoning the Ultimate Source, who holds him on the line while making a call, our indefatigable analyst learns the answers to the last two of his questions. With the requested figures cascading from his mouth like falling dominoes, he relays the newly acquired information to the Penultimate Source, then to the second person he called, who thereupon supplies him with an answer for the first person he called, who thereupon provides him with an answer to the original question.

To the original caller he triumphantly proclaims — "four billion dollars, give or take a hundred million" — gilding the lily of his day's success by asking if there is any other way he can be of assistance. "As a matter of fact," his friend replies, "I need to know which is preferred for use in very high-speed integrated circuits: gallium arsenide or Josephson Junction-based technologies?"

Our pundit is startled; the Ultimate Source had just given him the answer. He responds smugly: "Gallium arsenide, naturally. Everyone knows that." The caller thanks him, adding that he wanted to confirm the answer he'd just given to another friend — the friend was, of course, the Ultimate Source. And so it goes. Could anyone disagree that it's a hard-knocks life being a pundit prognosticator? His plight may be as pathetic, in fact, as that of the typical user of his prognostications. It's no wonder that all of the computer industry's punditry lives for the same fantasy. They dream of boarding a jet, reaching into the seat-pocket for the in-flight magazine and finding a portfolio in its stead. On it, big as life itself, are the words: "TOP SECRET: The IBM Corporate Plan, 1984."

Visions of a yacht in a Galapagos lagoon inevitably end the dream. For this is indeed the stuff of which fortunes are made. The right stuff.

Lecht is chairman of Lecht Sciences, Inc., a New York-based think tank specializing in computer and communications technologies.

system. It lets you review the status of orders, prices, credit or inventory availability at a moment's notice. You can change orders easily.

And the system is flexible enough to handle special requests for shipping vendors, packaging, delivery dates or special handling procedures.

Just as important, MSA's online realtime system helps you control internal costs. It moves orders along without costly error or duplication of effort. It provides current information on pricing, discounts and special sales agreements with individual customers.

And it's a powerful tool for controlling inventory, since you can conveniently check on inventory status daily.

You'll find MSA's new Order Processing System flexible and easy to use. It works with the MSA Manufacturing System to let you schedule production more efficiently. And promise ship dates to customers more confidently. Of course, it's also perfectly integrated with MSA's Financial System.

If your company is ready for a dramatic improvement in your order processing, contact Robert Carpenter at (404) 239-2000. Or write Management Science America, Inc., 3445 Peachtree Road, N.E., Atlanta, Georgia 30326.

Navigate through performance problems with EPILOG™/MVS

Before EPILOG/MVS, performance problems were often hidden in piles of printouts and pages of reports.

With EPILOG/MVS, you can find the answers to your questions about...user response... service levels...capacity management... and more.

The problems of wading through masses of data are now solved by a breakthrough in EPILOG/MVS. It's called the System Performance Navigator. With it you visually identify a problem area on the CRT (example, Figure 1: long response time of 1.81 seconds on Tuesday, July 5) and simply put a command character on this problem line (for example, "D" for degradation and "R" for resource utilization). The System Performance Navigator will immediately generate the next display customized to the specific problem area.

EPILOG/MVS guides you from problem to solution in as little as three easy steps. The System Performance Navigator allows you to navigate: from weekly summary information to hourly details, from service levels to degradation analysis, and from degradation analysis to resource analysis.

EPILOG/MVS: Simple to use—but powerful!

For more information, contact your Candle representative.

SOFTWARE & SERVICES

Will 1984 be Cincom's year?

SOFTALK

PAUL GILLIN
CW Senior Editor

Look for 1984 to be a big year for Cincom Systems, Inc. The Cincinnati-based vendor of systems software and the highly successful Total data base management system (DBMS) has been eerily quiet for the last two or three years. The reason is that it has been in a period of intensive research and development activity that is just beginning to show fruit, according to company officials.

Cincom's recent announcement of a set of decision support applications based on the mainframe and a version of its Mantis application development system for the IBM Personal Computer XT/370 is the first of what could be a flurry of product activity from Cincom this year.

The company will round out its manufacturing product line with a vendor analysis and purchase system, a $1.5 million-line bear of an application that will give it a functionally complete offering in this area. We can also expect to see some general financial applications released this year, led off by an accounts receivable package. The move will put Cincom into an increasingly crowded market that now includes some of its major competitors in the data base field.

Expect to see a kernel of the company's TIS data base product released as a relational DBMS in an effort to provide an upgrade path for current users of Total.

The kernel will include the underlying data base structure, In-Line Directory, physical data manager, Logical User View and directory; it will not include most of TIS's programming facilities.

The announcement would also be an attempt to help define a market for TIS, which is one of those rare products that can't be easily pigeonholed. Cincom calls it an "integrated data base system," but the DBMS component only makes up about 10% of the TIS code. By re-

Vendor blasts HP users group
Cites unfair rating

By Jeffry Scaler
CW West Coast Bureau

AUSTIN, Texas — A local software supplier is threatening to sue a Hewlett-Packard Co. users group to protest the allegedly invalid results of a recent membership survey in which the vendor's main product received only lukewarm customer-satisfaction ratings.

Of the more than 60 survey respondents who evaluated the performance of Protos Software Co.'s fourth-generation programming language, only half are named in the company's master list of certified customers, according to Protos Vice-President Gary Simmons.

The rest of the respondents are apparently nonusers who generally expressed considerably more dissatisfaction with the product's operation than the bona fide customers and, thus, substantially lowered Protos' overall score, Simmons said.

In addition to contaminating the survey findings and casting doubt on the study's validity, the performance ratings have harmed the software company's sales and have provided advertising fodder for at least one prime competitor, he complained.

"We already know of one person who wanted to buy our product and whose preference originally had the inside track," Simmons said. But opponents of the proposed purchase "seized upon the survey results and ultimately used them to shoot the acquisition down. There's no question in my mind that the impression the survey has left in some potential customers' minds has been a factor in their analysis of our product."

Concern about the survey's possible impact on Protos' sales prompted the firm last month to draft a letter demanding that the HP 3000 International Users Group revise the disputed findings and print the changes in its monthly magazine, *Interact*. But thus far, the demand has failed to produce the desired result.

"The information we released in our survey is exactly what we initially said it would be — our members' opinions about a broad range of products for the HP 3000," said users group Executive Director William Crow. "We never tried to qualify our

On-line Software's Freestyle debuts

FORT LEE, N.J. — On-line Software International has announced Freestyle, a data base access system that the vendor said allows users to access selectively, manipulate and update data regardless of how that data is organized or stored.

The Freestyle system is said to be based on the company's Content Address Method technology, which allows data access by the content of a record rather than through traditional keys. The system reportedly "fits" its information into less than 25% of the original file size, offering improved disk space efficiency.

Four components of Freestyle are currently available, including the Freestyle dictionary, end-user functions that include a free-format query language, an applications program interface and the Content Address Method technology. A fifth component scheduled for release in March 1984 reportedly will provide the ability to connect indirectly related information from multiple files.

Freestyle is said to operate by creating a content index of data and then using that index to locate data. Even data that is not structured by means of a data base management system (DBMS) can be treated as a single source of information and used accordingly, the vendor said.

Freestyle was designed to operate on IBM processors in conjunction with IBM's Vsam, Isam and Bdam access methods. The vendor said it can also be used with most currently available DBMS. The introductory price for Freestyle is $50,000.

On-line Software International, Fort Lee Executive Park, Two Executive Drive, Fort Lee, N.J. 07024.

Micro-mainframe link targets IBM users

ROCHESTER, N.Y. — First Concept Technologies, Inc. has announced a microcomputer-to-mainframe link that reportedly will support Basic and Pascal programs on the IBM Personal Computer and a variety of data base management systems (DBMS) on IBM mainframes.

Called Interchange/1, the system is said to allow microcomputer applications to access and update records contained in an IBM mainframe data base. Interchange/1 reportedly operates in conjunction with such mainframe systems as Cincom Systems, Inc.'s Total and TS2; Cullinet Software, Inc.'s IDMS; Software AG of North America, Inc.'s Adabas; and Vsam. A spokesman said the system runs under the host teleprocessing monitor and is independent of the operating system.

With Interchange/1, according to a spokesman, the user issues basic get, insert, update and delete commands and operates on logical, flat records. The system performs all translation necessary to access the mainframe data base. Utilities are also provided that accommodate the uploading and downloading of data, and the download utility prompts for file and any Boolean criteria, retrieves matching records from the data base and displays, prints or writes the records to a user-specified micro file.

A customer moving from one DBMS to another requires no modifications to the micro-based Interchange/1 modules. The logical nature of the system's commands insulates the user from DBMS changes.

In the initial release, Interchange/1 will support Pascal or Basic programs on the IBM Personal Computer. Support is also provided for the Radio Shack TRS-80, Apple Computer, Inc. microcomputers and the Wang Laboratories, Inc. Professional Computer. An unlimited usage license for Interchange/1 is $45,000.

First Concept Technologies, P.O. Box 23510, Rochester, N.Y. 14692.

ACT announces portable DBMS for minis, CPUs

NEW YORK — Advanced Computer Techniques Corp. (ACT) has announced Clio, a transportable data base management system for minicomputer and mainframe systems.

According to the vendor, Clio uses ACT's proprietary data allocation method known as Virtual Space, which allows the system to assign a virtual address to data elements that are independent of storage device and data relationships. Clio reportedly permits any type of relationship to be defined, including hierarchies, networks, relational inverted files and qualifiers.

The system is said to support a layered information organization with concurrent on-line and batch data base access. It includes host language interfaces for Cobol, PL/I, Fortran and assembler programs, and its virtual space architecture provides for data structuring, data base modification and growth and data compression.

Clio reportedly also includes a set of support tools, including a data dictionary, report writer, query language, data manipulation language and text editor. Transaction journalization and data base roll-back recovery facilities ensure data integrity across system or program restarts.

Clio is available for IBM 360 and 370 mainframes and for plug-compatible mainframe systems under IBM's MFT, MVT, VS1/2, MVS and VM/CMS operating systems. It is also available for Honeywell, Inc.'s DPS 6 Level 6 and DPS 7 Level 64 processors under the Gcos operating system. Its license price ranges between $40,000 and $80,000 depending on the host system.

ACT, 16 E. 52nd St., New York, N.Y. 10016.

SYSTEMS SOFTWARE

UNIVERSITY COMPUTING CO. UCC-8 Release 2.0

University Computing Co. has announced Release 2.0 of its UCC-8 data center management software, which includes enhancements to the system's change management capabilities.

UCC-8, which runs on IBM mainframes in IBM MVS and VS operating system environments, is said to give data center directors control over help desks, network control centers, change control and inventory management processes. Enhancements to the package include program function keys for screen processing, automatic notification of overdue tasks and capabilities for user formatting of additional comments screen permitting the duplication of existing working documents.

A vendor spokesman said that UCC-8, through its on-line capabilities, allows managers to look directly into their operational environment as the software encompasses every activity taking place within a data center. The spokesman said the modeling functions of the package's

Continued on page 49

SOFTWARE & SERVICES

Continued from page 48

change management capabilities were enhanced also.

UCC-8 Release 2.0 is priced at $40,500.

University Computing, UCC Tower, Exchange Park, Dallas, Texas 75235.

LEVI, RAY & SHOUP, INC.
Dynamic Report System

Levi, Ray & Shoup, Inc. has announced the Dynamic Report System (DRS) which, the vendor said, is a utility package to transfer IBM CICS on-line print loads to the JES II and JES III components of IBM's MVS operating system.

According to the vendor, DRS's dynamic file allocation bridge between CICS and the JES spool data sets operates on a line-by-line or on a completed report basis.

DRS is said to utilize subtasking to eliminate interference with CICS. In addition, report application programs link to the appropriate DRS interface modules and pass report parameters via a call. The calls create new reports, add print lines and terminate reports, according to the vendor.

DRS operates under all releases of MVS, JES and CICS/VS. It is priced at $3,500.

Levi, Ray & Shoup, P.O. Box 18598, Dallas, Texas 75218.

STERLING SOFTWARE MARKETING, INC.
ESP Release 2.0

Sterling Software Marketing, Inc. has enhanced its Execution Scheduling Processor (ESP), a job scheduling system for IBM 370 mainframes.

The system consists of two modules: dependent job control and job submission systems. The package features data set trigger, automatic JCL tailoring and historical tracking, according to the spokesman.

The JCL tailoring capability allows a user to include or exclude portions of a procedure, the vendor said.

The package runs under any release of IBM's MVS operating system. For one CPU, each module costs $12,000; together, the two modules sell for $21,600.

Sterling Software Marketing, Crocker Bank Building, 1007 Seventh St., Sacramento, Calif. 95814.

MARTIN & MARTIN TECHNICAL SERVICES
Telescope

Martin & Martin Technical Services has announced Telescope, described as a tool for the IBM CICS programmer in IBM's MVS operating system environment.

Telescope is said to consist of more than 30 on-line transactions and a TSO cross-region monitor. The system features a dynamic storage map, memory display and optional memory alter, detailed terminal information and detailed Vsam file information.

Telescope is designed for MVS users of CICS Version 1.5 or 1.6. The system is priced at $5,000 or can be leased for $200 per month, the vendor said.

Martin & Martin Technical Services, 1626 Stafford Drive, Orlando, Fla. 32809.

SYNCSORT, INC.
Syncsort OS Release 2.5

Syncsort, Inc. has announced Release 2.5 of Syncsort OS, said to be a sort and merge program for IBM's OS operating system environment.

According to a spokesman, enhancements to Release 2.5 include data utility features that provide report writing, field manipulation and multiple output capabilities.

Syncsort OS Release 2.5 can sort and manipulate data and present the output in user-specified report form. Its report writing capabilities — dubbed Sortwriter — include headers, trailers, totaling and subtotaling and page and section levels, the spokesman said.

A multiple output feature can reportedly produce any number of separate outputs from one pass of the sort and direct each output to a different device.

Used in conjunction with the sort's selection and formatting functions and Sortwriting features, this allows the simultaneous generation of a variety of reports, which are individually formatted and contain unique records, according to the vendor spokesman.

Release 2.5 of Syncsort OS is licensed for three years at $7,600, the vendor said.

Syncsort, 560 Sylvan Ave., Englewood Cliffs, N.J. 07632.

PRODUCTIVITY AIDS

BSC, INC.
Flexsys 4

BSC, Inc. has introduced Flexsys 4, an application generator that runs on IBM Series/1 minicomputers.

The generator features menu-driven screens, commands on each menu and screen-building capability, according to the vendor. Features include automatic changing, deleting and adding of records to a screen, sorting on any or all fields and support for subtotal, subheading, header and page-footing options.

The system consists of two modules: an application development module costs $10,000, and a customizing feature sells for $800.

BSC, 1505 Roswell Road, Marietta, Ga. 30062.

INTERACTICS, INC.
Smash Release 5.0

Interactics, Inc. has announced an enhancement for its Special Module for Application Screen Handling (Smash), an interactive Cobol screen generator that runs on Prime Computer, Inc. minicomputers.

Release 5.0 generates an audit trail in a file maintenance program and features a recovery program that rebuilds a master file, according to the vendor. The system creates documentation for a terminal user whenever an add, change or delete module is used.

A one-time licensing fee costs $5,000 with a 10% annual charge for maintenance.

Interactics, 7303 Marisol St., Houston, Texas 77063.

MANAGEMENT AND COMPUTER SERVICES, INC.
Datamacs II

Management and Computer Services, Inc. has announced that its Datamacs automatic test data generator is now available for Honeywell, Inc.'s Gcos 3 and Gcos 8 operating systems.

The software, according to the vendor, will be offered both as a stand-alone package — Datamacs II — or in combination with its Tracmacs audit path analyzer system. Datamacs II is said to facilitate the creation and maintenance of test data for software testing, and it allows quality assurance techniques to be built into programs to guarantee that they meet requirements.

Datamacs II is priced at $26,000, and Tracmacs is priced at $20,000. Discounts are available when the systems are purchased together.

Management and Computer Services, Great Valley Corporate Center, Valley Forge, Pa. 19482.

APPLICATION PACKAGES

MCBA, INC.
Release 3 accounts payable

MCBA, Inc. has announced Release 3 of its accounts payable package written in Cobol for Wang Laboratories, Inc.'s Wang VS series computers.

The enhanced package reportedly includes an interface to MCBA's Release 3 general ledger, purchase order and receiving and mailing list packages. It features a user-defined general ledger account number format allowing up to 21 characters in up to five levels.

One-time source code licenses range from $2,000 to $6,000.

MCBA, 9441 Hermosa Ave., Montrose, Calif. 91020.

SAGE DATA, INC.
Sagegraf

Sage Data, Inc., has announced a graphics product designed to enhance the performance of Isaco, Inc.'s Tell-A-Graf on IBM VM/CMS.

Sagegraf reportedly provides Tell-A-Graf users with menu-driven selection and execution of graphics, an integrated time series data base manager and error-free downloading

COMBOARD / HASP

the low overhead DEC/IBM interconnect

Your DEC computer has more important things to do than be a processor for your IBM communications. Save valuable computing capacity by handling your interconnect workload with a COMBOARD.

COMBOARD is a 16 bit CPU based single board computer that plugs into your DEC UNIBUS™. Then the COMBOARD, not the DEC host, handles all the real-time interrupts and protocol processing associated with data communications.

COMBOARD's low overhead means your DEC users still get quick response time at their terminals. Your CPU capacity is used for applications software, yet your data communications thruput remains high.

COMBOARD models 631,731 and 1231 support transfer rates from 2400 to 56,000 bps, and are the leaders in DEC to IBM or CDC interconnects.

GEOGRAPHIX, INC.
Graphix-11

Geographix, Inc. has announced that its Graphix-11 business graphics software is now available for use with all operating systems for Digital Equipment Corp.'s LSI-11, PDP-11 and VAX-11 series processors.

In addition to its original DEC RT-11 version, the vendor said, Graphix-11 can be operated with DEC's RSX-11M, RSTS/E, VMS and TSX-Plus operating systems. Graphix-11 produces line graphs, bar charts, pie charts and scatter grams using dot matrix printers.

The system either operates in an interactive question-and-answer format or is driven by a keyword file as part of a larger application, the vendor said.

The RT-11 and TSX-Plus versions of Graphix-11 are priced at $1,095, the RSX-11M and RSTS/E versions at $2,095 and the VMS version at $2,950, according to the vendor.

Geographix, 156 N. Third St., Philadelphia, Pa. 19106.

COMMERCIAL SYSTEMS LABORATORIES, INC.
CS Ware

Commercial Systems Laboratories, Inc. has announced CS Ware, which combines the company's general business accounting applications and report and inquiry program generators.

The package includes five accounting modules: CS accounts receivable; CS accounts payable; CS general ledger; CS payroll; and CS order entry/inventory.

CS Ware can run on the entire family of Data General Corp. processors utilizing DG's Interactive Cobol (Icobol) software. CS Ware may also operate under DG's AOS and AOS/VS operating systems.

CS Ware integrates user-defined data dictionary elements and Icobol copy libraries to generate inquiry and report programs in each application module.

CS Ware costs $10,000.

Commercial Systems Laboratories, 459 N. Dean Road, P.O. Drawer 2710, Auburn, Ala. 36830.

AMERICAN SOFTWARE, INC.
Application package enhancements

American Software, Inc. has announced enhancements to three of its application packages for IBM 4300 series and larger mainframes under IBM's DOS/VS operating system using Vsam.

Release 11.2 of its Inventory Management System software has been enhanced to provide better planning capabilities and more precise exception messaging and reporting, the vendor said.

The package's Inventory Evaluation Subsystem has been rewritten so that summary results showing inventory investments necessary to accomplish customer service or in-stock objectives can be produced for historical comparison.

American Software also enhanced its Sales Forecasting System, adding more user controls and greater simulation capabilities.

Its Fixed Asset Accounting System has been enhanced with an on-line security feature that allows users to assign, by password, those functions and screens each user is allowed to access, according to the vendor.

The enhancements to each package are provided at no cost to current users. The Fixed Asset Accounting Sys-

Soup up your Volkswriter.

Everybody knows Volkswriter, the word processing software package that's become synonymous with high performance. Now, there's a way to get even higher mileage out of your Volkswriter. Hook it up to a Dataproducts P Series dot matrix color printer.

The versatile P Series translates the executive class, word processing capabilities of the Volkswriter into brilliant full color charts, graphs and text. It delivers a full page of text quality print in nothing flat while its sheet feeder automatically prevents loading hassles. And the P Series uses pin feed or plain paper and has the brains to fill every appropriate line with crisp, sharp copy, even if it has to justify to do it. And the P Series color printer has dual speed capability for correspondence quality output for the Volkswriter's many word processing applications and high speed output for draft and spreadsheets.

The Dataproducts P Series color printer. Think of us as a supercharger for your Volkswriter.

For more information go to your nearest computer store and ask about the Dataproducts P Series color printer, or call Dataproducts, 1-800-258-1386.

tem is priced between $25,000 and $50,000.

The Inventory Management System is priced between $20,000 and $150,000, and the Sales Forecasting System costs between $18,000 and $150,000, depending on the modules and features selected, according to the vendor.

American Software, 443 E. Paces Ferry Road, Atlanta, Ga. 30305.

COMPREHENSIVE SOFTWARE DESIGN, INC.
Magics enhancements for System/38, System/36 users

Comprehensive Software Design, Inc. (CSD) has announced that its IBM System/34 Manufacturing, Accounting and Production Information Control System (Magics) enhancements are now available for users of IBM's System/36 and System/38 processors.

The enhancements include CSD's Multiple Warehouse material requirements planning (MRP) system, which allows manufacturers with multiple manufacturing facilities to process MRP for all manufacturing locations.

CSD's Vendor Release System will inform vendors when, where and what to ship in order to meet scheduled based on the latest MRP requirements generation.

The vendor said prices for the software packages range from $800 to $6,000.

Comprehensive Software Design, Suite 115, 22371 Swan Road, South Lyon, Mich. 48178.

AUTO-TROL TECHNOLOGY CORP.
Plan; Illustrator

Auto-Trol Technology Corp. has announced two application packages for its Advanced Graphics Workstation 32-bit computer-aided design and drafting systems for architectural design and drafting. The packages will also operate on Auto-Trol's Advanced Raster Workstation, which is designed to run on Digital Equipment Corp.'s VAX-11 series of 32-bit processors.

Plan is an architectural drafting and documentation system that will aid in creating floor plans and reflected ceiling plans, a spokesman said. It reportedly enables a designer to generate door and finish schedules automatically. It provides design symbols such as doors, windows, electrical symbols and bathroom fixtures.

Illustrator is an architectural rendering design system providing over 70 symbols, including people, automobiles and vegetation, for the designer's use in creating high-quality presentation renderings of plan and elevation views. It features figure manipulation capabilities that enable the user to create symbols.

Plan is priced at $1,750 per copy and Illustrator at $1,000 per copy.

Auto-Trol Technology, 12500 N. Washington St., P.O. Box 33815, Denver, Colo. 80233.

CREATIVE COMPUTER RESOURCES, INC.
Utility billing system

Creative Computer Resources, Inc. (CCR) recently announced a billing and file maintenance package designed for water districts utilizing the IBM System/38.

The company sells the system is a standard package that is then customized by CCR to meet the needs of individual clients, a spokesman said.

The package reportedly tracks customers' daily water consumption, generates monthly utility bills, produces individual billing forecasts and maintains records on each account in the system.

The base price of the package is $40,000.

CCR, Suite B-103, 151 Kalmus, Costa Mesa, Calif. 92626.

KENCOR CORP.
Patient Accounting System Software

Kencor Corp. has introduced Patient Accounting System Software (Pass), a medical accounting and statistical system designed for the Wang Laboratories, Inc. VS computer.

The Pass package consists of patient scheduling, patient billing and accounts receivable modules. The package maintains patient diagnoses, medical procedures and administrative information, according to the vendor. Reportedly, the package

Fill in your IBM micro/mainframe communications picture.

AST Research, the leader in IBM PC enhancement products, brightens your micro/mainframe communications picture with a full palette of economical, integrated hardware/software masterpieces. With AST Products, you can emulate IBM terminals or create PC-based Local Area Networks.

AST improves your office operating cost picture.

AST communications products give your IBM PC the flexibility to act as a terminal for your host system or as a stand-alone computer for smaller tasks. Your PC won't bog down the mainframe with unnecessary small jobs and local computing on the PC eliminates phone line charges too. Get the power of a mainframe when you need it and personal computer convenience right at your fingertips.

Applications solutions that are shadows of genius.

AST keeps pace with your ever-changing applications requirements with reliable, high quality, cost effective communications products. AST products provide support for Bisync and SNA/SDLC communications protocols as well as networking multiple PCs for sharing resources.

Choose AST products — by the numbers.

These AST communications packages are currently available:

1. ASTRIDA™ emulates a 3274/3276 controller and 3278 or 3279 display terminal using SDLC protocol.
2. AST-RJE™ emulates 2770 batch RJE and remote 3270 display terminals using 3270 Bisync protocol.
3. AST-POOL™ allows your PC to connect to an IBM 3274/3276 cluster controller via coax cable and emulates a 3278 or 3279 display terminal.
4. AST-9750™ emulates 2770, 2780, 3741, and 3780 RJE workstations using Bisync protocol.
5. AST-4361™ emulates a IBM Model 12 remote workstation connected to an IBM System 34, 36 or 38.
6. PCnet™ is the first Local Area Network designed specifically for the IBM PC or XT and the PC-DOS 1.1 or 2.0 operating system.
7. CC-285™ is a user-programmable dual-port card capable of communicating in Async, Bisync, SDLC or HDLC protocols.

Discover how well AST can fill in your micro/mainframe communications picture. For descriptive data sheets, write or call: AST Research Inc., 2121 Alton Ave., Irvine, CA 92714. (714) 863-1333. TWX: 3106781911

produces Medicare, Medicaid and private patient bills and statistical reports, including the Bureau of Community Health Services Common Reporting Requirements.

Pass costs between $25,000 and $50,000 for a one-time licensing fee. Yearly maintenance costs vary from $200/mo to $500/mo.

Kencor, 3647 All-American Blvd., Orlando, Fla. 32810.

CONTINENTAL HEALTHCARE SYSTEMS, INC.
DRG Module

Continental Healthcare Systems, Inc. has announced a modular software add-on package designed to provide automated medication recordkeeping for its Pharmakon minicomputer systems.

The Diagnostic Related Group (DRG) Module is said to integrate clinical and financial data to provide medication reports and other pharmacy management reports relating to diagnostic related groups, the disease categories carrying fixed Medicare and Medicaid fees.

The module reportedly uses DRG numbers to maintain pharmacy records by patient name, medication, physician, discharge and type of case. It is available for Pharmakon Systems 200, 400 and 1000 at a price of $5,000.

Continental Healthcare Systems, 8900 Indian Creek Pkwy., Overland Park, Kan. 66210.

HARPER AND SHUMAN, INC.
CFMS

Harper and Shuman, Inc. announced Computer-Based Financial Management System (CFMS), an interactive architecture and engineering system that runs on Prime Computer, Inc. Series 50 minicomputers.

The system features project control, accounting, financial reporting, billing, payable and multidivisional systems integrated into one application. The software requires 1M byte of main memory and 20M bytes of auxiliary storage. The system features interactive data entry, editing and reporting capabilities.

Prices for a one-time licensing fee range from $14,000 to $25,000.

Harper and Shuman, 68 Moulton St., Cambridge, Mass. 02138.

DATA BASE MANAGEMENT SYSTEMS

UNITED INFORMATION SERVICES, INC.
Catalogue

United Information Services, Inc. (UIS) has announced an enhanced data dictionary for the Digital Equipment Corp. VAX-11 version of its Seed data base management system (DBMS).

Called Catalogue, the dictionary is part of Seed's application development system and is said to offer users of the DBMS reporting capabilities for improved communication, analysis and control. Catalogue allows data to be tracked during the continuing development of a data base.

The Seed DBMS includes the application development system, decision support option and the Catalogue data dictionary. The VAX-11/730 version of Seed is priced at $24,500, the VAX-11/750 version at $35,000 and the VAX-11/780 version at $49,500.

UIS, P.O. Box 8551, Kansas City, Mo. 64114.

SYSTEM SUPPORT SOFTWARE, INC.
Quikwrite enhancements

System Support Software, Inc. has announced enhancements for its Quikwrite, an end-user report writing system.

The release is designed to provide increased functionality and greater ease of use by nonprogrammers.

The release reportedly features native support for IBM Vsam files, automatic access to table functions, additional built-in exit points for inserting user-written subroutines, a free-form dictionary maintenance program and new verbs, including attach, average and onbreak.

Quikwrite is designed to run on IBM mainframes, including the IBM 360, 370 and 4300 series, and is available now.

Quikwrite is priced at $8,500 for IBM DOS and $9,500 for IBM OS.

System Support Software, 5230 Springboro Pike, Dayton, Ohio 45439.

NATIONAL COMPUTING INDUSTRIES, INC.
Tums Release 5.0

National Computing Industries, Inc. has announced Release 5.0 of its Total Utility Maintenance System (Tums), which supports Cincom Systems, Inc.'s Total data base management system (DBMS).

The vendor said Tums is a utility maintenance system developed to support the Total DBMS when used in conjunction with IBM mainframes.

The new release supports Total Series 80 and TIS and IBM disk devices, including the 3375 and 3380 disk drives.

Vsam support has been added for count-key data and fixed-block architecture devices in addition to features designed to increase loading and unloading performance.

Tums is priced at $3,950 for IBM's DOS/VSE operating system and $4,450 for the IBM OS/MVS operating system.

National Computing Industries, 6075 Roswell Road, Atlanta, Ga. 30328.

SOFTWARE & SERVICES

LANGUAGES

INTERNATIONAL ELECTRONIC MACHINERY, INC.
Fortran-77 compiler

International Electronic Machinery, Inc. has announced a Fortran-77 compiler for Hewlett-Packard Co. series 200 desktop computers.

The compiler is compatible with Ansi-Fortran 77 compilers used on mainframe computers.

The compiler reportedly allows programmers to effectively use the graphic and I/O capabilities of Series 200 microcomputers.

It costs $1,200, the vendor said.

International Electronics Machinery, P.O. Box 1818, Fort Collins, Colo. 80522.

LOGITECH, INC.
Modula-2

Logitech, Inc. has announced a Modula-2 compiler for the Digital Equipment Corp. VAX-11 family of supermini computers under DEC's VMS operating system.

Modula-2 is a general purpose programming language with systems programming capabilities. The compiler, which was developed at the University of Hamburg, West Germany, is said to generate VAX native object code, while separately compiled Modula-2 modules are linked with the VAX/VMS linker. According to the company, the VAX/VMS Symbolic Debugger can be used to debug Modula-2 programs.

Features specific to the VAX/VMS environment are said to include four floating data types, including Byte (8-bit), Shortword (16-bit), Quadword (64-bit) and Octaword (128-bit).

The price for a single computer license is $1,500 per year with 90 days of maintenance. Additional maintenance is available for $300 per year.

Logitech, 165 University Ave., Palo Alto, Calif. 94301.

METHODOLOGIES

CARA CORP.
Cara Systems Development Standards enhancements

Cara Corp. has announced a price increase and enhancements to its Cara Systems Development Standards. The customized software and service package, customized for each client, is designed to assist organizations in systems development, according to a spokesman for the vendor.

Enhancements are said to include Cara's Epsilon automated estimating support tool, a software package designed to run on IBM mainframes under TSO; Wang Laboratories, Inc. 2200 VS80 minicomputers; and IBM Personal Computers.

Additional enhancements are said to include Cara's training program and training manual, "Heueristic/Prototyping Considerations," which deals with problem-solving by experimentation; a professional systems analyst development seminar tailored to each organization; Cara's "Software Selection Guidelines and Techniques" publication.

The price increase from $31,500 to $41,500 goes into effect March 15.

Cara, Suite 110, 611 East Butterfield Road, Lombard, Ill. 60148.

RATING from page 47

respondents and never guaranteed that all the people who completed our survey form would be bona fide users."

But although he rejects Simmons' claim that the survey presents Protos' product in a misleading light, Crow did recently offer the company an opportunity to air publicly its gripes through *Interact*'s letters-to-the-editor column. In response to the software vendor's persistent criticisms, he also recently issued a brief disclaimer advising users group members to take the survey findings with a proverbial grain of salt.

For Protos, both of Crow's attempted remedies fall woefully short of their intended mark. A general disclaimer, Simmons said, would be insufficient to counteract a misconception about a particular company's product, and a Protos-written letter of complaint would carry far less weight than a formal retraction from the group itself. In a letter sent last month to the users group's headquarters, Protos "indicated its willingness to initiate legal action if we don't do as they ask," Crow said.

The object of the six-year-old vendor's simmering discontent is the latest edition of the users group's annual membership survey, which solicits performance evaluations about the HP 3000 itself and its full range of hardware and software accessories.

Jointly funded by HP and the users group, the survey's most recent installment was mailed early last year to nearly 4,200 members, who were asked to rate their products' operation on a scale of zero to four. As defined by the survey's creators, zero represents the lowest degree of user satisfaction and four the highest. Recipients were asked to evaluate Protos' product and four competitors.

Of the almost 1,800 members who returned questionnaires, 66 gave an opinion on the Protos language, which earned an average rating of 2.67. A top rating of 4.0 indicates a "very satisfied" user, while scores of 3.0 and 2.0 correspond to "satisfied" and "neutral," respectively.

Disappointed by its product's less-than-glowing performance grades, Protos supplied Crow with a copy of its certified customer list and asked him to check its contents against the names of the 66 survey respondents. Only 33 of the names were found to appear in both sets of data, but as a whole, the subgroup of bona fide users evaluated Protos at 3.06, considerably higher than the product's official, published rating.

CINCOM from page 47

leasing the DBMS module separately, the company hopes to provide a method for users to migrate to TIS's data base structure and then add the application development facilities when it is ready to make the financial and organizational commitment.

Also look for activity in the area of network management. Cincom has long espoused the distributed data base concept and offers a vehicle to run applications written for the Digital Equipment Corp. VAX-11 superminis on IBM mainframes. The company's strength in providing systems software for a broad range of processors makes it a natural to provide some path for piecing them all together. In combination with TIS, a network management facility would be a major step in preparation for a full distributed processing system.

Notably absent from Cincom's Jan. 18 announcement of an IBM Personal Computer-CPU link was an agreement with a microcomputer vendor. Most sellers, of course, have chosen to link up with Visicorp or Lotus Development Corp. to develop routines to optimize downloading into those vendors' popular Personal Computer-based packages. Cincom has an agreement up its sleeve as well, but it won't be with Lotus or Visicorp. Officials aren't saying just who will be the lucky recipient yet, but expect an announcement soon.

Cincom may cap off all this activity later in the year with a public stock offering. With expected 1983 revenues of more than $70 million, it would be one of the largest software firms ever to do so. Cincom President Tom Nies has been a vigorous opponent of public offerings until this point, saying that stock market pressure typically prevents firms from investing heavily in any R&D that doesn't boost the bottom line. However, in a recent interview Nies indicated he has softened a good deal on the stock offering question.

DOS/VSE and CICS/VS Frustration?

BIM gets it out of your system.

BIM presents a line of proven programs that maximize your system's capabilities, saving you time, labor and expense. These program products help get the most out of your system and people.

BIM-EDIT — the editor with more than 25 significant features that ICCF can't match.
BIMSPOOL — Prints output in POWER/VSE spooling queue on local or remote 3270 terminal printers. (Received ICP Million Dollar Award 1982).
BIMSPOON — On-Line to Batch Print Spooling. Prints data passed from CICS application programs into the POWER spooling queue.
BIM-PDQ — POWER Dynamic Queuing performance enhancement. Eliminates 86% of the I/O to heavily used POWER queue.
BIM-CDIS — Comprehensive problem analysis and display of operational CICS system.
BIMTEXT — Word processing, document composition system. Create formatted documents from free-form input.
BIMSWAP — Switch local 3270 BTAM terminals between multiple CICS partitions without special hardware or additional ports.
BIMCMPRS — CICS 3270 data compression system. Reduces response time for remote terminals significantly. Available for OS/VS1 and MVS also.
BIMP3270 — Comprehensive CRT screen image print facility. Copy to terminal printers or spool queue for system printer.
BIMSERV — On-line display of library directories and entries, VSAM Catalog entries, disk VTOC's, etc.
BIMSOSLOG — Console Message File display. Used by computer operations and programmers.
BIMSCNTR — DOS/VSE System Status, Performance Measurement, and POWER Queue display.
BIMDEVC — Displays Logical Unit assignments for physical devices, to resolve operational problems.
BIMSUBMIT — On-line Job Edit and Submission facility.

BIM programs are cost-efficient, many less than $900. You can save even more with our group package offerings. Products are available on permanent, annual, or monthly leases, and shipped on a 30-day free trial basis. Product documentation is available on request.

BIM also performs systems programming consulting, with consultants based in Minneapolis and Washington, D.C. Computer time services are also available on our 4331-2 system, on-site or remote.

COMMUNICATIONS

Fiber net ties 27 Miami buildings

MIAMI — To meet this city's growing demand for communications — both voice and data — occupants of 27 buildings in the financial district talk via pulses of light over hair-thin glass fibers.

When the digital lightwave network is completed in 1985, a total of 30 buildings in the Bell Point-Brickell Ave. district of the city, which includes brokerage houses, banks and high-rise condominiums, will be a part of the most extensive lightwave installation of its kind in the world. The system will be able to handle 672 simultaneous telephone calls or equivalent amounts of data or television over each pair of fibers.

The lightwave system servicing Miami's "Wall Street" is known as a Fiber SLC (subscriber line carrier) system. It is a rugged system, specifically designed for the telephone loop — the facilities that connect a customer with a local switching office.

Financial fiber

Bell Laboratories worked with Southern Bell Telephone Co. to tailor the lightwave network for Miami, and AT&T Western Electric Co. manufactured the system for installation by Southern Bell.

"It's the right kind of system for this particular situation," said Larry Mixon, spokesman for Southern Bell. "The fiber-optic system has better applications for technology and for a financial district that transmits large quantities of data. It will afford us greater capacity to handle the kinds of things these types of customers will want — like quantity and speed."

Hub of net

The hub of the communications network is a Southern Bell switching center, which sends out three half-inch cables, each containing 144 glass fibers. One goes to the Bell Point area and two to the Brickell Ave. area, where they fan out in individual fiber pairs to the buildings.

Lightwave systems solve one of the thornier problems faced by this and other U.S. cities, which is a growing shortage of underground space for cables and electronic equipment. Fibers take up little space in ducts, and electronic and optical equipment isn't required for signal boosting within local transmission systems.

"If we hadn't gone to half-inch fiber cables for this project, we'd have had to install 20 copper cables, each of them the diameter of a fist, just to meet today's demands," said Al Naranjo, engineering manager at Southern Bell. "And to keep pace with the growth we expect, we'd have had to install two more cables each year for the next three years. Then we'd have had to dig up the streets to make room for more cable in ducts and manholes."

Naranjo expects the network's capacity will be sufficient for many years. Each pair of fibers now carries 96 simultaneous voice calls, or a combination of voice, data and private-line services. (One fiber carries incoming calls and the other outgoing calls.) Next year, Southern Bell plans to increase sevenfold the amount of calls each pair can handle by expanding the terminal equipment.

"The system is ideal for this area because of its ruggedness," said Greg Greco

PBX integration urged by voice-mail users

Private branch exchange (PBX) integration is the feature most desired by voice-mail system owners, according to a report recently released here.

The report, titled "The Voice Mail Industry: A Strategic Analysis," published by Venture Development Corp., stated that 33% of current voice-mail system users claimed that PBX integration, which provides functions like automatic telephone-answering and message-waiting notification, tops the list of desirable voice-mail system items.

These systems provide computer-controlled deposit, storage and delivery of voice messages, allowing nonsimultaneous, verbal communications between two parties located anywhere in the world.

Without PBX integration, a voice-mail system must be reached through a separate telephone number by the caller and be periodically queried for messages by its subscriber. These inconveniences can be eliminated by making voice mail a standard PBX function, the report stated.

Additional voice-mail features desired by system owners include message desk, message-waiting indicator, address verification, subscriber directory, message delivery verification, intersystem networking, user-configurable management reporting and programmable message delivery time.

The voice-mail industry, which garnered $35.2 million in combined 1983 hardware and services revenues, will experience a compounded annual growth rate of 185% through 1987, when industry revenues will total $2.3 billion. Of these revenues, $1.9 billion will come from voice-mail hardware which is integrated into PBX systems. The study is available for $3,290 from the publisher.

Venture Development is at One Washington St., Wellesley, Mass. 02181.

System installed to curb illegal textile shipments from Taiwan

EL SEGUNDO, Calif. — A communications system that is designed to curb illegal textile shipments from Taiwan to the U.S. and improve the tracking of textile imports against U.S. quotas recently became operational here.

The system was developed for the Taiwan Textile Federation (TTF) by Computer Sciences Corp., located here, and its Taiwan representative, China Data Processing Center.

According to Jim Furlong, a spokesman for Computer Sciences Corp., the system, which began functioning Jan. 1, is part of the company's network data communications service called Infonet, a worldwide data network which offers remote computing services. The data center utilizes an IBM 3083 and Sperry Corp. computer equipment.

"The way the system works is that the trade association of Taipei [Republic of China], through a computer on their end of the line, sends the information concerning authorized textile shipments via communications satellites in our network to our Infonet data center in the Washington area. We store it for the convenience of the U.S. Customs Service who then reaches over via the network and takes it into their computer," Furlong said.

As shipments arrive at U.S. seaports or airports, customs officers using remote Raytheon Co. terminals linked to the agency's IBM 3083 computer are able to verify the description, value and quantity of the goods with the information stored in the computer.

The system allows the trade association to inform the U.S. Customs Service of exactly what textile products have been cleared for shipment to this country for inclusion under the quota assigned to Taiwan by the U.S. government. Only those shipments recorded in Customs Service computers will be allowed entrance when goods arrive at the U.S. entry points.

In April and May 1983, customs reportedly seized $1.2 million worth of illegal shipments, Furlong said.

Taiwan's textile trade with the U.S. runs about $1.5 billion a year, with the TTF administering the quota on behalf of local manufacturers. Some textile traders have been known to forge TTF documents to enable their goods to gain entry to the U.S., thereby excluding legitimate shipments that arrive later and are barred from entry because the quota has already been filled.

According to James Mahan, a spokesman for the Customs Service, the Taiwanese government picks up a summary of all the visas they issue each week and to whom they were issued. "This information comes into customs' computers in the U.S. from all of its ports of entry once a week," Mahan said. "What we do is match their listing against the visa that is accompanying the merchandise to find out whether it's a false visa or not. And this is the way that we seize illegal merchandise."

The system is working very well so far, Mahan said. Future plans call for implementing satellite communications for the system to provide timely information on a daily basis, he noted.

Ansi, CSA publish first joint standard

To aid videotex/teletext growth

The American National Standards Institute (Ansi) and the Canadian Standards Association (CSA) have published a North American standard to help accelerate the commercial development of videotex/teletext services in the U.S. and Canada.

The standard provides manufacturers and those involved in supplying and transmitting text and graphics for electronic banking, shopping, news, entertainment, interoffice and other communications with an agreed-upon information interchange format for developing their products and services.

The standard sets formats, rules and procedures for encoding alphanumeric text, redefinable characters and pictorial information in many colors.

It accommodates 7-bit and 8-bit bytes, depending on implementation needs.

Videotex/teletext services are available commercially on other continents, mainly Europe, but they are available only on a limited basis in the U.S. and Canada.

The groups that developed Ansi X3.110-1983 and CSA T500-1983 point out that without a standard, hardware and software manufacturers, information providers, publishers and transaction services such as banks and retailers, have been reluctant to make the investments necessary for wide use of videotex/teletext in North America.

The Ansi X3.110/CSA T500 standard is titled Videotex/Teletext PLPS and is the first joint U.S. and Canadian standard in the information processing field.

Copies of the standard are available for $20 each.

Ansi, 1430 Broadway, New York, N.Y. 10018.

FIBER from page 57

of Bell Laboratories. "It operates flawlessly without air conditioning in the hot, damp basements of the Bell Point-Brickell Ave.-area buildings."

The Bell Point-Brickell Ave. project is one of 20 lightwave systems under construction by Southern Bell this year. But the popularity of loop lightwave systems is growing rapidly among all the former Bell operating companies.

"In 1984, about 30% of all new loop systems installed by telephone companies are expected to be lightwave," said Bob Parthum of AT&T Western Electric. "Within the next few years, lightwave should account for more than half of all new systems."

You Can Read Some of the Dumps... Some of the Time...

In the past, programmers had to slave over monumental stacks of paper to resolve abends.

Trying to convert hexadecimal numbers like four score and seven or debating over where the abend occured was as tough as splitting logs.

But then was brought forth a new notion — Abend-AID. It was a great moment in dump history. Programmers were emancipated as the drudgery of solving abends was abolished. They were free to devote their time to more productive tasks.

Abend-AID transfers the burden of debugging from the programmer to the computer. Abend-AID output shows What Happened, When it Happened, Where it Happened and supplies the necessary supporting data in an easy-to-use format that can almost fit on the back of an envelope (10-12 pages, in English).

Abend-AID is available for both IBM OS and DOS installations. Listed below are unique Abend-AID options for your specific needs.

☐ **Abend-AID/COBOL** — The first practical source level debugging tool.
☐ **Abend-AID/SPF** — 80 column "easy-to-use" viewing capability which permits programmers to interactively debug abends at their terminals.
☐ **Abend-AID/ONLINE** — 80 column CRT output for easy viewing.
☐ **Abend-AID/DOS/DLI & Abend-AID/OS/IMS** — Features special diagnostic routines for IBM's data base systems.

Free Abend-AID Product Evaluation.

For additional product information, or to arrange for your 30-day FREE evaluation of Abend-AID, just give us a call at 800-521-9353 (In Canada or Michigan, 313-540-0400), or clip your business card to this ad and mail it to: Compuware, Systems Software Division, 32100 Telegraph Road, Birmingham, Michigan 48010.

Abend-AID. The civil way to address program abends and cancels.

Datapac adds three countries

OTTAWA — Telecom Canada has added three countries to its Datapac International service and announced an option called a network-user identifier (NUI), which makes the international service more accessible.

The new additions to the service, which is provided in conjunction with Teleglobe Canada, are in Denmark, Greece and Norway. With the expansion, Telecom Canada's nationwide, packet-switched Datapac network provides access to similar networks in 37 countries.

The NUI option makes possible overseas connections for customers using Datapac 3101, which allows Ascii and teletypewriter terminals to communicate through Datapac. The NUI option allows these customers to place third-party calls from public-dial ports to foreign packet-switched networks.

The NUI can also be used to place domestic calls and calls to U.S. networks from public-dial ports.

The monthly rate for NUI is $27.80 (Canadian) each; plus $2.20 (Canadian) for each additional NUI. A one-time installation fee, per request, is $55.65 (Canadian).

COMMUNICATIONS

COMMUNICATIONS CONTROLLERS

MATROX ELECTRONIC SYSTEMS LTD.
Cem-1

Matrox Electronic Systems Ltd. has announced the Cem-1, a single-board I/O communications controller, which is plug-compatible with the IEE-P796 (Multibus).

The controller has an onboard bidirectional, 16-bit parallel port that provides interface to Digital Equipment Corp.'s DR-11W or equivalent interface card. The port allows direct communications between the Multibus-based system and DEC's VAX supermini, PDP-11 or LSI-11 minicomputer at rates up to 400K word/sec. The price is $2,495.

Matrox Electronic Systems, 5800 Andover Ave., Montreal, Quebec, Canada H4T 1H4.

KMW SYSTEMS CORP.
VP-10 Vector Processor

KMW Systems Corp. has announced the VP-10 Vector Processor, a controller that allows the connection of raster output devices to a mainframe computer.

The product accepts random vectors, symbols and other graphics information from a host mainframe, translates the data at computer speed and drives the various output devices at rated speed, the vendor said.

The VP-10 has a vector capacity of 200,000. Other features include a 128K-bit semiconductor-based memory, color support for both intensity modulated and dithered devices, diagnostics and integrated communications. Prices range from $5,000 to $10,000.

KMW Systems, 8307 Highway 71 W., Austin, Texas 78735.

COMPUTRONICS, INC.
Network version

Computronics, Inc. has introduced a version of its Network that adds support for additional automatic dialing modems.

According to the vendor, a Prime Computer, Inc. computer user can communicate with another computer using one of its existing asynchronous multiline controllers. Any system communicating asynchronously in Ascii can be accommodated. Network can be used to communicate with systems from Prime, IBM, Digital Equipment Corp., Hewlett-Packard Co., Data General Corp. and Sperry Corp.

According to the vendor, neither special software on the remote system nor a device to support communications is necessary. The price is $1,200.

Computronics, 130 N. Ash, Wood Dale, Ill. 60191.

VOICE/DATA COMMUNICATIONS

FUJITSU SYSTEMS OF AMERICA
PSC/I

Fujitsu Systems of America has introduced the Point-of-Sale Communications System/I (PSC/I) for the IBM Series/1.

The product provides an interface between store-level point-of-sale (POS) systems and central data processing sites. PSC/I supports the company's 7680 and 7990 POS terminals, its 7110 Terminal Support Processor and the TEW 2001 POS terminal. It was designed to operate exclusively on the IBM Series/1, the vendor said.

The system offers execution of data collection and reformatting, file upload/download, message distribution, POS terminal parameter maintenance/downloading and reporting, a company spokesman said. PCS/I costs $35,000 and will be available in July.

Fujitsu Systems of America, 9841 Airport Blvd., Los Angeles, Calif. 90045.

REMINGTON RAND CORP.
Serif workstation enhancements

Remington Rand Corp. has announced added data communications capabilities to its Serif workstation.

The communications features provide automatic dialing and answering and memory password recall. Other product features include access to telex networks for domestic and international communications; access to information services, airline information and other business data; and on-line connect to Westlaw for legal case data bases, the vendor said. The price is $600. Optional software costs $450.

Remington Rand, 9950 W. 74th St., Minneapolis, Minn. 55344.

Transaction Data unveils product line

Transaction Data Systems, Inc. has announced the Freedom Network System, a family of data communications products that range from single software packages to complete custom-designed, turnkey data networks.

The system software was designed to operate on Perkin-Elmer Corp.'s supermini-computer systems. These packages include Packet Network Facility for building private packet switching networks; Network File Service Facility and File Transfer Facility for network operating system services; and Micom Multiplexer Emulation Facility, according to a spokesman for the vendor.

The network system supports all IBM protocols, including Systems Network Architecture/Synchronous Data Link Control as well as Sperry Corp., NCR Corp., Control Data Corp., Burroughs Corp. and X.25 protocols.

Individual software modules range from $2,500 to $5,000. Complete network systems range from $80,000 to $3 million.

Transaction Data Systems, 5750 Major Blvd., Orlando, Fla. 32805.

COMMUNICATIONS SOFTWARE

CONTEL INFORMATION SYSTEMS, INC.
Mind/Voice

Contel Information Systems, Inc. has introduced Mind/Voice, an interactive software-based system for the analysis of telephone traffic originating at a single location.

The product is used to design optimal mixes of Wats facilities. The system considers the use of the tie lines — private branch exchange (PBX) to PBX — and Foreign Exchange lines — PBX-to-distant-city telephone company exchanges. It will also consider the tariffs of specialized common carriers, as well as AT&T's current and proposed tariffs, the vendor said.

The traffic analysis subsystem reads call-record data, organizes the information into an accessible data base and produces analytic and management reports, which give the user a profile of the existing traffic and how it is handled, according to the vendor. The license costs $3,500/year.

Contel Information Systems, 130 Steamboat Road, Great Neck, N.Y. 11024.

APPLIED VOICE TECHNOLOGY
Phonexpress; Phoneforms; Voicepak

Applied Voice Technology (AVT) has introduced three software board products that allow users to create voice-messaging and response systems on S-100 bus-based computer systems.

According to the vendor, the three voice-processing packages — Phonexpress, Phoneforms and Voicepak — can be used with proprietary software and run under Digital Research, Inc.'s CP/M 86 and MP/M 86 operating systems.

Phonexpress is a voice-mail package that digitally records, stores and plays back voice messages for up to 300 users using one to four telephone lines. It includes all software and documentation, a voice I/O processor and from one to four telephone-line cards. Costs for a single-line package are $4,500, with an additional $1,000 for each additional line card.

Phoneforms is a voice-oriented data collection and retrieval utility that allows users to create custom-voice questionnaires at the telephone.

It can be combined with Phonexpress to form a voice-messaging environment to support data collection. It is priced at $3,000.

Voicepak is a package of Pascal subroutines that handles telephone activity, processes Touch-Tone data and records and plays back speech, the vendor said.

The programs cost $750 as add-ons to the Phonexpress package or may be purchased for $2,500 as a package, which includes the necessary I/O processor and/or a telephone-line card.

Applied Voice Technology, Suite 5A, 2103 Harrison Ave., Olympia, Wash. 98502.

PRENTICE CORP.
Auto-dialing modem

Prentice Corp. has introduced a 1,200 bit/sec autodialing modem that utilizes two custom Cmos integrated circuits to achieve full-duplex, Bell 212A-compatible operation, tone sensing, voice/data control and RS-232C operations.

Features include full call-progress tone sensing of dial tone, busy tone, remote ring and voice, according to a spokesman for the vendor.

There is also a function that eliminates the need for option switches or special EIZ RS-232 cables, the spokesman said. The price for the modem is $475.

Prentice Corp., 966 Caspian Drive, P.O. Box 3544, Sunnyvale, Calif. 94088.

ANCHOR AUTOMATION, INC.
Signalman Mark XII

Anchor Automation, Inc. has introduced the Signalman Mark XII, an autodial, autoanswer modem.

Some of the product's features include manual operation through a keyboard without computer coding, or automatic operation to answer and originate calls at 1,200 bit/sec for Bell 212A compatibility and up to 300 bit/sec for Bell 103. The product also detects dial-tone and busy signals, automatically displaying dialing status on the CRT, the vendor said.

The Mark XII uses a standard RS-232 serial interface with a built-in cable, comes equipped with two telephone jacks and cord and is directly connected to a wall-telephone outlet, according to the vendor. The price is $399.

Anchor Automation, 6913 Valjean Ave., Van Nuys, Calif. 91406.

TEST EQUIPMENT

TELPAR, INC.
DCT-100 Datacomm Tester

Telpar, Inc. has announced the DCT-100 Datacomm Tester, an enhancement to the standard RS-232C "breakout box" marketed by the company.

The tester provides the industry-standard breakout panel with the additional ability to print out the received or transmitted data stream on a 20-col. thermal-printer integral with the tester.

The tester also provides verification of transmitted data and commands and time to analyse and study the data and commands. The price is $995.

Telpar, 4137 Billy Mitchell Road, Addison, Texas 75001.

AUXILIARY EQUIPMENT

PERIPHERAL TECHNOLOGY, INC.
Scat Network Controller

Peripheral Technology, Inc., a manufacturer of IBM 3270 terminal controllers, has introduced the Scat Network Controller (SNC), an expansion feature for Scat 3 protocol converters.

According to the vendor, the product allows up to 25 Ascii RS-232 communications ports under a single control-unit address. The vendor's standard protocol converters provide from three to five IBM 3270 ports per unit.

SNC may be distributed up to 4,000 feet using RS-422. The product allows distribution throughout buildings or across campuses without the expense of coaxial cabling, the vendor said.

The price for the three-port SNC is $795; the five-port SNC is $995, according to the vendor.

Peripheral Technology, 14784 N.E. 95th, Redmond, Wash. 98052.

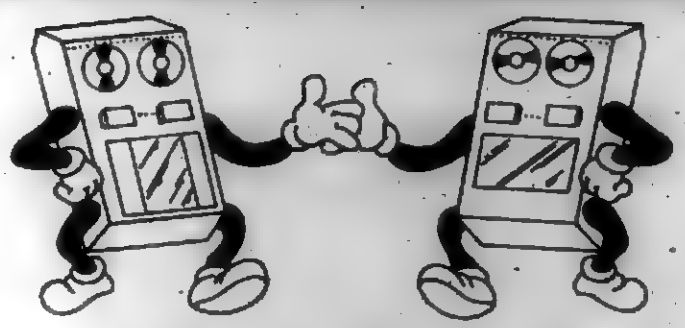
OUR SWITCHES MAKE YOUR IBM SYSTEMS WORK LIKE A TEAM!



If you have more than one IBM or plug compatible processor, Digital can help you get the most for your hardware investment. Our switches allow you to achieve backup and peripheral configuration flexibility at a fraction of the cost you're probably thinking.

Whether you have two processors or more, Digital has a switch to suit your requirements.

- Model 4101 The lowest priced matrix switch on the market.
- Model 3421 The only manually operated channel switch in the industry.
- Model 3403 A remote controlled channel switch designed for underfloor installation.

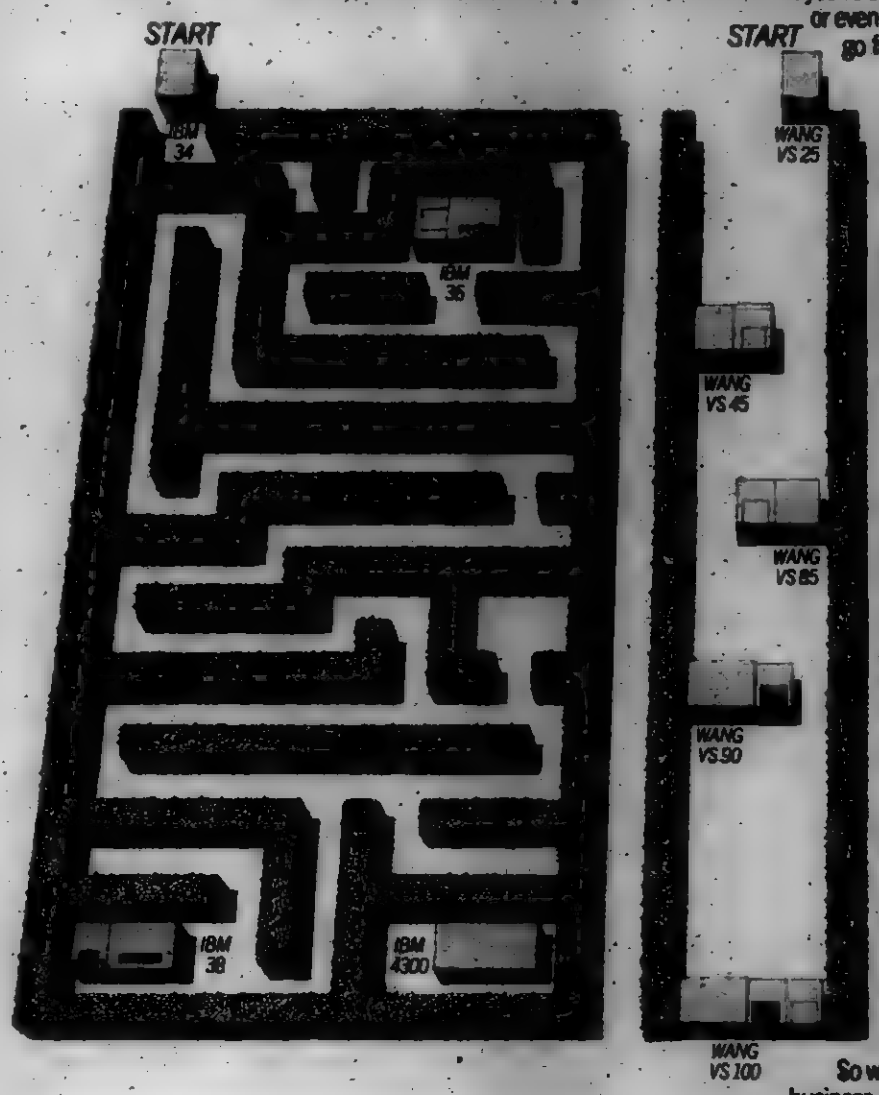
Compared to IBM, Wang has the growth path of least resistance.



If you're currently considering an IBM 34 or even a 36, consider this: where do you go from there?

To an IBM 38? Sure, if you want to spend up to 18 months converting to a different operating system, different source codes, and different software.

To an IBM 4300? The same problem again. Only magnified. Because if the IBM 34 and 36 have little in common with the IBM 38, the IBM 38 has nothing in common with the IBM 4300 (logo excepted).

Now consider the Wang VS line.

One operating system that supports the same software, utilities, and documentation. A line that's compatible from top to bottom and bottom to top. A line that's compatible with other Wang equipment as well as most mainframes, including IBM. And a line that can tie you into total office automation faster and easier than any other systems available anywhere.

But even if you only need a single computer, a Wang VS is a better choice. Because every VS offers data processing, voice, graphics, electronic mail and extensive networking. And only a Wang VS offers Word Processing Plus, feature for feature the most comprehensive word processing software in the world.

So whether you plan to buy just one business computer or a whole lot, the Wang VS line is simply the best way to go. And the only way to grow.

Compare it to IBM; it's easy to see why Wang offers the growth path of least resistance.

For a demonstration of Wang VS computers, call 1-800-225-9264. Or write to: Wang Laboratories, Inc., Business Executive Center, One Industrial Avenue, Lowell, MA 01851.

What solid-state means for you

SHOP TALK

HOWARD DICKEN

During this last year, the semiconductor industry has been promoting the new developments in solid-state memory. But what does it mean to your computer equipment or data processing capabilities?

For example, this year a half-dozen semiconductor companies announced the availability of the first samples of a 256K-bit dynamic random-access memory (RAM).

As shown in Table 1 (see page 68), these new developments have been occurring approximately every three years since 1970, and the next improvement is expected in 1986.

This increase in memory means (again referring to Table 1) the cost per bit of memory has been decreasing over 30% per year for the last 14 years. This cost improvement curve, which is expected to continue, translates into a similar cost/performance improvement for the computer hardware.

Operating speed improved

In addition to less expensive hardware, improvements in solid-state memory also improve the operating speed of processors. As a rule, the larger the number of bits that are packed onto a chip, the denser the circuits must be to access the memory.

This has a direct impact on the internal performance of computer systems, often rated in terms of millions of instructions per second. The use of higher capacity chips, particularly in large computer systems, offers several advantages.

In large systems, for example, the majority of memory takes the form of hard magnetic disks. This is still the lowest cost approach (see Figure 1 on page 68); however, the access time is much slower than with semiconductor memory.

As semiconductor costs continue to decrease, more of the computer's active

See MEMORY page 68

Study predicts microminis may finish off 16-bit minis

By Patricia Keefe
CW Staff

CUPERTINO, Calif. — The demise of the 16-bit minicomputer is a trend industry watchers have been predicting for some time. In response to sagging sales related to higher performance superminicomputers and less expensive microcomputers, makers of traditional 16-bit minicomputers have been struggling to find niche markets for their products. But now the end may truly be near.

According to a recent study, a new class of processor, the microminicomputer — sometimes called the supermicrocomputer — may pound the final nail into the 16-bit minicomputer maker's coffin. Microminis appear to do everything the older 16-bit machines could do, but are more reliable, less expensive and take up less space.

Now what happens to all the 16-bit minis? Users may find themselves holding what amounts to outdated hardware. In addition, if the proliferation of microminicomputers continues, control of corporate computing may slip through the hands of the DP department and into the laps of end users, according to consultant Andrew Allison, who prepared the report, "Managing the Microminicomputer Explosion: A Guide for Manufacturers, Users and Third Party Participants" for Electronic Trend Publications here.

Microminicomputers are one of the most significant outcomes of the confluence of a

Mirage available for DG Eclipse MV

WESTBORO, Mass. — Data General Corp. has announced that Rational Data Systems, Inc.'s Mirage system is available on DG's Eclipse MV series processors. The Mirage system, which consists of the Mirage M102 processor, lets Eclipse MV users run microcomputer software based on Digital Research, Inc.'s CP/M 80 operating system on DG's 16- and 32-bit computers.

The Mirage M102 processor reportedly can occupy any I/O slot in a standard chassis and allows Eclipse users to run programs written for the CP/M operating system. The M102 contains two Zilog, Inc. Z80A-based micros, each with 64K-bytes of random-access memory and asynchronous communications ports. The system also contains CP/M, a variety of utilities and the Mirage "server."

The Mirage system is available as a package with hardware and software for two users for $3,295. Rational Data Systems also offers the Mirage F109 Floppy Disk Subsystem as an option for $1,495.

DG, 4400 Computer Drive, Westboro, Mass. 01581.

Xerox announces 2700 II printer with SNA interface capability

EL SEGUNDO, Calif. — An enhanced model of the Xerox 2700 distributed electronic printer that can interface with IBM's Systems Network Architecture (SNA) was announced recently by Xerox Corp.

Called the Xerox 2700 II, the unit reportedly can be used for printing in an SNA environment.

Also announced were two software packages for the 2700 II, which are said to enhance the printer's capabilities for creating documents. The programs are called Remote Print Management Facility (RPMF) and Document Composition Facility-Xerox Postprocessor (DCF-XP).

Like the 2700, the 2700 II will continue to be used for remote or distributed printing or for printing directly from small business computers and minicomputers. It can store 256K bytes of memory, compared with 64K bytes on the 2700. The font capability per page was also enhanced, allowing up to 16 different fonts to be used on each printing job. Eleven foreign languages were also added to the printer, the vendor said.

The 2700 communicates in a binary synchronous mode over IBM 2770, 2780 and 3780 protocols. The 2700 II can operate as a distributed printer in IBM 3274/3276 (using the Xerox 274 interface) and 3770 networks (via the Xerox 271 communications module) using SNA Synchronous Data Link Control.

The 274 enables interactive printing in the 3274/3276 environments, while the 271 allows the 2700 II to handle batch printing jobs in IBM 3770 environments, the vendor said.

The RPMF package reportedly helps to manage the creation, storage and printing of forms and charts on the 2700 II. It is the 2700 II version of the Xerox Host Forms Description Language, used on Xerox 9700 and 8700 printers and allows most charts and forms designed for those printers to be recompiled for printing on the 2700 II, the vendor said.

The second software package, DCF-XP, is said to interface the 2700 II to the IBM Document Composition Facility, a page composition software package.

Current 2700 printer customers can have their machines upgraded on-site to the 2700 II. There is a $1,000 upgrade charge for purchased units.

Single-unit purchase price for the 2700 II is $19,995. On a two-year lease, with a monthly printing volume of 5,000 pages, the price for a 2700 II is $600/mo. Also, both software packages — RPMF ($3,870 for a single-user, one-time license fee) and DCF-XP ($6,000 for a single-user, one-time license fee) — and the 271 communications module ($2,750 purchase price) will be available in the second quarter of 1984. The 274 interface ($2,375 purchase price) controller will be available in the third quarter of 1984, Xerox said.

Xerox, 880 Apollo St., El Segundo, Calif. 90245.

Amdahl Corp. recently announced 15% lease-price increases on its 8000 series of direct access storage devices. The increases go into effect April 23, a spokeswoman said.

CLIMAX COMPUTER CORP.
Screenstor

Climax Computer Corp. recently announced a peripheral device to provide existing RS-232C-equipped terminals with off-line intelligence and memory storage.

Called Screenstor, the product reportedly links any host computer and terminal equipped with RS-232C ports to provide up to 100 pages of terminal memory with scrolling facilities, up to 100 pages of static memory storage off-line, parameter and character conversion features and translation facilities to standardize different terminals.

The device contains an auxiliary port to control a slave printer or other serial device. The unit also provides battery backup of 2K bytes of parameter storage and reportedly will operate in the same environment as the connected terminal.

The device is priced at $485.

Climax Computer, Suite 105-172, 4790 Irvine Blvd., Irvine, Calif. 92715.

SPERRY CORP.
Sperrylink Model 30 price cuts

Sperry Corp. has announced price reductions, effective immediately, for peripheral components on its Sperrylink Model 30 desktop workstation.

Under the new pricing structure, a typically configured Sperrylink Desk Station, which includes a workstation, diskette subsystem, printer and appropriate software, has been reduced to $7,869.

Additional price reductions are as follows:

- Diskette expansion — a 10% price cut from $700 to $630.
- Draft printer, 160 char/sec — a 32% price cut from $1,875 to $1,275.
- Draft printer, 160/40 char/sec — a 34% price cut from $2,125 to $1,395.
- Model 0431 Correspondence Quality Printer — a 23% price cut from $2,641 to $2,025.
- Forms tractors — a 34% price cut from $495 to $329.
- Cut sheet feeder — a 25% price cut from $995 to $745.

Sperry Computer Systems Operations, P.O. Box 500, Blue Bell, Pa. 19424.

NORTHERN TELECOM, INC.
Displayphone enhancements

Northern Telecom, Inc. announced an enhanced keyboard and other features for its Displayphone terminal.

The keyboard was designed with full-size keys that operate like a standard-size keyboard. The keyboard extends in front of the Displayphone and can be stored inside when not in use, according to the company. Also, the key caps can be changed to accommodate special key designations for other terminal types, such as an on-line IBM 3278.

Other enhancements reportedly include a cap lock function that allows the user to lock the alphabetic character keys in the uppercase mode, while leaving the numeric keys unaffected; automatic logon with password entry; a terminal identification feature that enables the Displayphone to respond to various computer systems; and an 81-number directory that allows users to designate entries as either digitone or rotary dial calls.

The Displayphone costs $1,295. Existing models can be upgraded with the new keyboard and features for $150 per unit or with just the firmware for $65 per unit.

Northern Telecom, P.O. Box 1222, Minneapolis, Minn. 55440.

PRINTERS/ PLOTTERS

XEROX CORP.
9700 Model V; 8700 Model V

Xerox Corp. has announced enhancements for its 9700 and 8700 laser-printing systems.

The 9700 Model V and 8700 Model V reportedly produce higher quality output than standard 9700 and 8700 models because of an improved imaging subsystem and an advanced Xerographic engine.

The printers were designed for use with the Xerox graphics system, which enables photographs, line art and other illustrations to be merged with text to produce publications, reportedly within hours.

In the new printers, the subsystem is said to feature a more tightly focused laser beam for better control of the dots comprising an image. Also, the Model V versions are said to use the Xerox 9600 Xerographic engine for a more efficient image transfer system.

The Model V printers are now available in New York, Chicago and Los Angeles, and will be available throughout the U.S. during the second quarter of 1984.

Purchase prices for the 9700 Model V start at $412,000, while two-year leases for printing volumes of one million page/mo start at $13,500/mo.

Purchase prices for the 8700 Model V start at $226,000, with a two-year

THE FIRST MOBILE COMPUTER.

THE COMPLETE COMPUTER FOR THE MOBILE PROFESSIONAL.

Professionals on the move in today's productivity-paced business environment have to run a little faster just to keep up.

They can easily spend half their time in airports, taxis, lobbies and hotels unable to do the work they'd like to get done.

But we have a solution.

Give them the powerful 9 pound, 16-bit computer that works when and where they do.

Give them an advanced battery-powered printer that attaches securely on the computer.

Give them an interactive human interface and operating environment that takes only 15-30 minutes to learn.

And unique field-oriented software that comes in rugged plug-in capsules.

In short, give them the Gavilan™ mobile computer.

PORTABLE TURNED PRACTICAL.

Never has there been a complete business computer system as sophisticated, yet as lightweight, as the Gavilan.

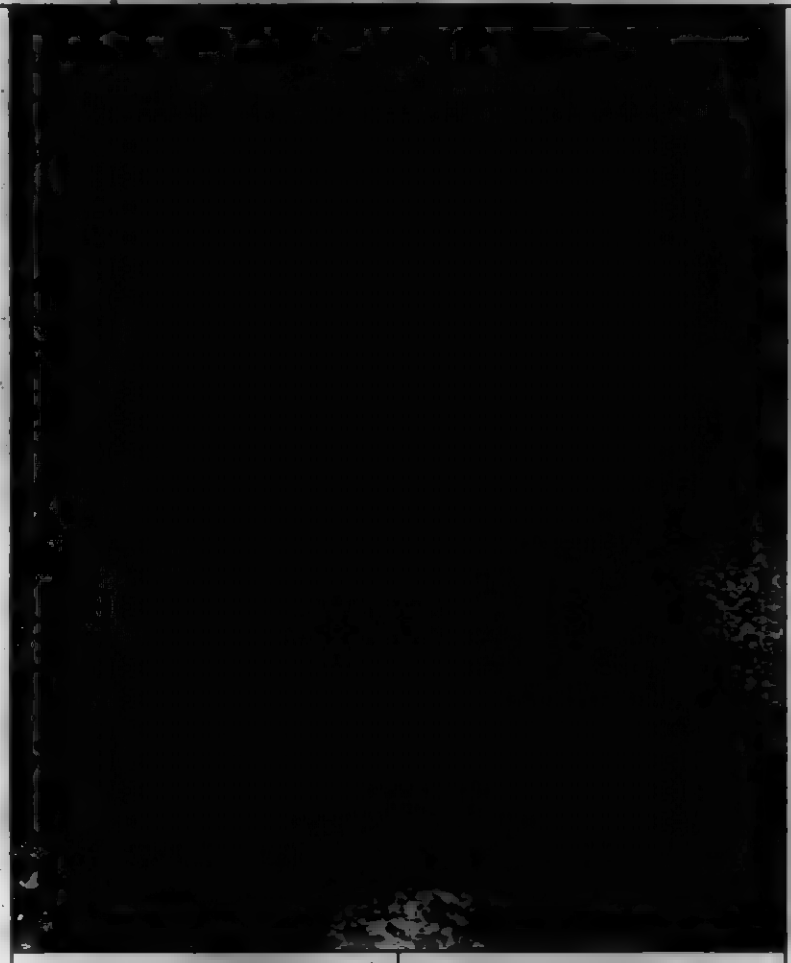
Self-contained, rechargeable 8-hour batteries free the user from external power constraints.

The 8 line X 80 character screen eliminates the need for an external monitor, although you can add one if you wish.

The full-size typewriter keyboard makes data entry as convenient as it is in desktop systems.

A built-in 3½" microfloppy disk drive and modem provide the capabilities of data handling and transmission where they never before existed.

And a 50 character per second printer gives the mobile professional in the field the immediacy of hard copy text, forms, charts, spreadsheets and graphics.



All in a compact 14 pound mobile office.

WE BUILT A MORE MOBILE MOUSE.

The success of any computer depends in part on the "friendliness" and accessibility of the user interface.

Especially in the field.

A standard mouse interface is fine for the expanse of a desktop, but not for work on the move.

So with the Gavilan, we incorporated a built-in touch panel: the first fully integrated computer mouse.

It's a pressure-sensitive pad just above the keyboard. Finger movements across the touch panel control the on-screen movements of a cursor.

But like a mouse, the Gavilan touch panel actually executes virtually all of the user commands, saving the keyboard for typing only.

Through the touch panel, users store and retrieve data. Cut and paste. Move documents. Scroll through pages of information. Zoom out for a complete look at the format of a document. Or even ask the computer what just happened and what to do next. With one finger.

SOFTWARE IN A CAPSULE.

The intuitive ease of talking to the computer through the touch panel is made possible by the unique Gavilan operating environment and software packages.

The applications packages come in durable capsules called CapsuleWare.™ They plug directly into the body of the computer, adding no additional volume. The operating software, (GO System™) then lets each of the applications communicate with each other through a common interface and a sharing of data.

The result is a completely integrated information environment that lets the user combine spreadsheets, graphics and word processing text together.

All in the same uninterrupted user mode.

OUTWARD MOBILITY FOR USERS, UPWARD MOBILITY FOR OEMs.

The Gavilan mobile computer and its CapsuleWare programs are creating vertical market demands—both in MS/DOS and the Gavilan operating environment—for software packages completely unrealized one short year ago.

That means new opportunities in applications development far beyond the typical office-bound programs. From air and sea navigation to banking services. Journalism to field auditing. Anthropology to insurance.

And that means you've got the chance to be first in your chosen field.

A position we strongly advocate.

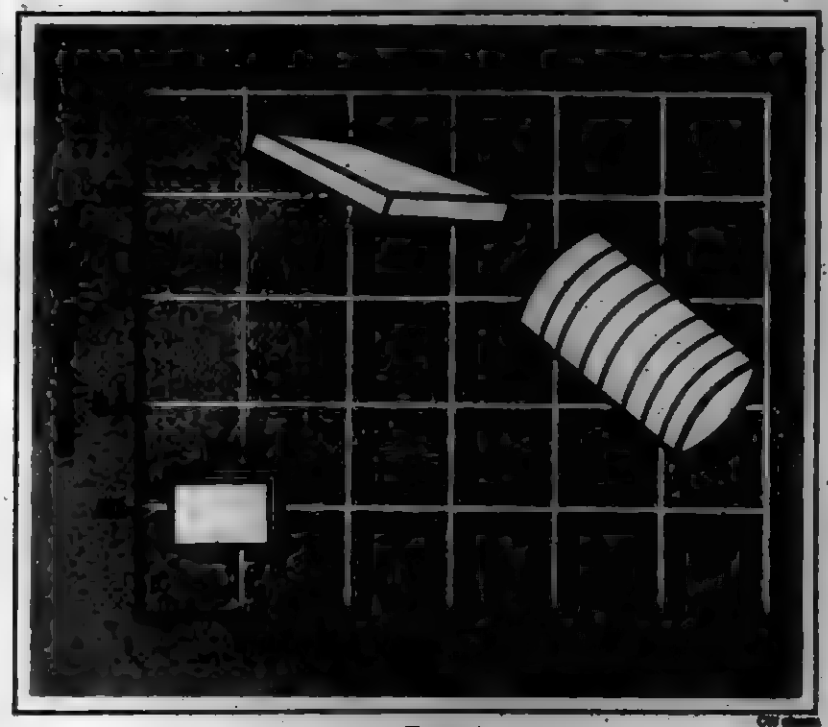

Figure 1

MEMORY from page 63

memory can be put in dynamic RAM. The result is an increase in system performance.

How much memory is needed? The words for this article were typed on a portable computer that required only 2,500 bytes of memory to store the data.

Typically, 3,000 bytes are required for one page of text. Thus, each 256K-bit dynamic RAM chip could store approximately 10 pages of written material.

The bottom line is that if present trends continue, your data processing equipment will continue to improve in performance, cost less and occupy less desk or floor space.

These same trends will also allow the benefits of various artificial intelligence computing capabilities, such as Natural Language and Expert Systems, to become cost-effective and economically viable for a wide range of business applications.

Dicken is president of DM Data, Inc., a Scottsdale, Ariz., technology research firm.

Table 1

MINIS from page 63

number of market forces said to be reshaping the computer industry, the report said. Chief among those forces are the accelerating trends in circuit density and speed and the increasing integration of computer and communications capability.

One area of predicted impact is market share. The total mini- and microminicomputer market will increase from $9 billion in 1982 to an estimated $25 billion in 1987. But the share held by 16-bit minis will decline from 66% to 18%. Use of microminicomputers, on the other hand, will increase from 6% to 48%, the study predicted.

Major Impact

For users, the major impact will be a plethora of products and suppliers capable of providing more computer and communications capability than most users can use. "Integration of these products and services into the corporate environment requires careful selection, procurement and installation planning," the report warned.

This planning should take into account overall corporate information goals and objectives, the proper role of the management information systems group and the human obstacles to widespread computer utilization. Moreover, such planning should not be left entirely in the hands of the DP staff, the report suggested.

Whether developed with the support of a management information systems group or independently, small-computer procurement policies are needed by even the smallest user, the study said.

"Failure to develop these will result in a costly proliferation of essentially similar, but incompatible, systems," the report said.

Procurement policies can be administered through the use of in-house channels of distribution such as centralized purchasing, an in-house computer store or volume purchase agreements. Product and supplier evaluation criteria should take into account the needs of inexperienced computer users.

The report costs $985 from Electronic Trends Publications, located at Suite 372, 10080 N. Wolfe Road, Cupertino, Calif. 95014.

GRAPHICS SYSTEMS

WAYNE KERR, INC.
Artworker

Wayne Kerr, Inc. recently announced Artworker, a stand-alone printed circuit board computer-aided design system.

Based on Mos Technologies, Inc.'s 6502 microprocessor, the Artworker system provides two levels of operation, according to a company spokesman: the "Designer" level, providing a computerized version of a conventional drawing board with on-screen message functions guiding the operator at every step; and for more highly skilled operators, "Designer Plus," allowing the user to input connectivity information as components are placed on the layout and to place tracks on the board exactly where desired.

The product features 16 pad sizes, ranging from .02 in. to .5 in., and four pad shapes, said to provide greater precision in the design process. The spokesman said the product also has a virtually unlimited number of package styles and pad layouts.

Eight user-definable track and line widths are reportedly visible on the screen, and 17 layers of possible design space, with each layer measuring 25 in. by 25 in., reportedly provide room for silk-screen masters, drilling diagrams and solder masks in addition to actual printed circuit board layers.

The product is priced at $24,950 and is available this month with a 30-day delivery.

Wayne Kerr, 400 W. Cummings Park, Woburn, Mass. 01801.

POWER SUPPLIES

RKS INDUSTRIES, INC.
RLM power line monitor

RKS Industries, Inc. has introduced the RLM power line monitor, a device that alerts users to power condition changes in computer equipment lines.

According to the vendor, a high proportion of computer malfunctions are due to fluctuating power conditions — dips, spikes, surges and voltage changes. With the monitor, the faceplate indicates a change to dangerously low or high line voltage and voltage spikes or drops, via a red light and alarm.

The monitor plugs directly into the wall outlet and monitors the power entering a workstation computer or peripheral. It can be used before computer equipment is installed to determine the status of power in various parts of the facility, a company spokesman said.

The RLM monitor sells for $245 per unit, with a 10% discount for quantities of five or more.

RKS Industries, 4555 Scotts Valley Drive, Scotts Valley, Calif. 95066.

TRANSWESTERN PRODUCTS CORP.
Ultraguard series

Transwestern Products Corp. has announced an uninterruptible power supply for business computers.

According to the vendor, the Ultraguard series is an ac-powered, battery backup power source for use with small computer systems and instruments that must remain operational during ac power blackouts. An indicator light gives continuous status of the power condition, and a tone alerts the user when the unit is operating on battery power.

Ultraguard provides up to 30 minutes of power to the computer system, allowing the operator to save current work in progress and shut the system down to avoid data loss or system damage, a company spokesman said.

The unit weighs 15 lb and provides 200W of uninterruptible power.

The price is $649, with volume price discounts available.

Transwestern Products, 1711 Senter Road, San Jose, Calif. 95112.

K/W CONTROL SYSTEMS, INC.
UPS inverter and controller module

K/W Control Systems, Inc. recently announced an uninterruptible power supply (UPS) inverter and controller module for its Piller 40K and 75K Vac 60 and 415 MHz frequency converters installed at sites utilizing IBM and Amdahl Corp. mainframes.

The module and an available battery package are reportedly field-installable and are said to extend the normal 500 msec power failure ride-through of the 60 and 415 MHz frequency converters up to 30 minutes or 15 minutes at full load.

The module reportedly monitors incoming utility line voltage, as well as the frequency at the terminals of the frequency converter. Upon detection of below-acceptable power levels, the controller automatically transfers the input over to the battery inverter system, according to a company spokesman.

The inverter, control package and contactors are housed in a single enclosure designed to be mounted on top of or beside the frequency-converter cabinet.

The module is priced at $15,500, and the price of the battery backup depends on configuration.

K/W Control Systems, R.D. No. 4, Box 114C, S. Plank Road, Middleton, N.Y. 10940.

DISCWASHER CO.
Spikemaster

Discwasher Co. announced Spikemaster, a multimode surge protector.

The product works in common mode and differential modes, reportedly incorporating five surge-suppression devices with a five-part filter section. Spikemaster features four sockets, a circuit breaker, an on/off switch with indicator light, 15A backup capacity and a 6½-ft cord, according to the vendor.

Spikemaster costs $79.95.

Discwasher, 1407 N. Providence Road, P.O. Box 6021, Columbia, Mo. 65205.

BOARD-LEVEL DEVICES

EMULEX CORP.
TC05; TC15

Emulex Corp. has introduced the TC05 and TC15 tape couplers to provide software-transparent storage and backup capabilities for any of Digital Equipment Corp.'s LSI-11, PDP-11, VAX-11 or Micro/PDP-11 series

HEADACHES?

GET FAST RELIEF WITH YOUR VERY OWN...

PERSONAL DATASET MANAGER

PDM is the latest addition to ASTUTE, the Data Set and Catalog Management System for MVS and VS1.

With PDM, you can:
- display information about your data sets in an easy-to-use scrollable format
- select individual data sets, and perform operations such as scratch, rename, browse, or call any program
- invoke ISPF browse or edit, or call any CLIST

Preliminary tests have shown that the use of PDM will save more than 50% of the CPU and elapsed time normally required by more traditional data set maintenance methods.

ASTUTE gives you PDM, plus over 45 other powerful and easy-to-use functions that provide complete control over your catalog and DASD environment. 45-day free trial available.

Call us today for more information!

and... ASTUTE WON'T UPSET YOUR BUDGET!

✔ DON'T MISS THIS...

Our complimentary seminar series will start this year in San Francisco on February 23, 1984. Call now for reservations.

AN EDUCATIONAL LIFELINE

"They promised me service like I've never seen.

I never saw it."

Stop the shock...with Exxon office automation.

Today, more and more companies are shocked over the time it takes to service their office automation equipment.

Shockproof your office automation

With Exxon office automation, "service shock" is a thing of the past. Because we provide service for every product we sell — quickly and efficiently.

If you ever need to call the Exxon toll-free service number, a service operator will immediately determine if your problem is operational or equipment oriented. If it's operational, a service specialist will duplicate your steps on live equipment to determine the best solution. If your trouble is with the equipment itself, a service call will be arranged instantly.

Ready where you are

The Exxon service organization covers virtually every county in America. And that means it's faster and easier for us to repair your equipment right in your office.

Computerized service system

From the time you purchase your equipment from an Exxon sales branch, our computerized service management system will maintain a complete service record of all your office equipment. So even before our field engineer arrives, we can begin to diagnose your problem.

For more information

Call 800-327-6666, or write Exxon Office Systems, P.O. Box 10184, Stamford, CT 06904-2184. We'll be happy to tell you about our basic maintenance agreement and customer service system.

Service to Exxon products is provided through the Exxon Office Systems Customer Service Organization, independent sales agents, and Western Union Telegraph Company Field Service Division.

EXXON OFFICE SYSTEMS

The future...without the shock.

SYSTEMS & PERIPHERALS

Continued from page 70

CPUs using Control Data Corp.'s Sentinel start/stop streaming ¼-in. cartridge tape drive.

Incorporating Emulex's bipolar, bit-slice microprocessor technology, the microprogrammed firmware on the board supports tape-streaming operations automatically, the vendor said.

Both couplers, when combined with the Sentinel drive, reportedly provide functional emulation of the DEC TS-11 tape subsystem, operating transparently to the standard DEC RSX-11M, RSX-11M-Plus, RSTS-E, RT-11 and VMS operating systems and diagnostic hardware. Both incorporate a 3.5K-byte buffer, are packaged on a single, quadwide printed-circuit board and require 5V at 6A. Tape transport is via a single 34-conductor flat cable.

The TC05 embeds directly into a DEC Q-bus backplane slot of the LSI-11 and Micro/PDP-11 series computers. It supports 22-bit addressing, providing a 4M-byte memory capacity on the LSI-11/23 Plus and Micro/PDP. The TC15 embeds in a Unibus SPC slot of the PDP-11 or VAX-11 CPU.

List price for the TC05 is $1,200/unit; the TC15 is $1,400/unit.

Emulex, P.O. Box 6725, Costa Mesa, Calif. 92626.

FORCE COMPUTERS, INC.
SYS68K/Dram-2; SYS68K/CPU-2

Force Computers, Inc. has introduced two memory boards, the SYS68K/Dram-2 and SYS68K/CPU-2.

The Dram-2 contains 2M bytes of random-access memory (RAM) on a double Eurocard form factor.

Standard features include byte parity checking with parity-fail indication; word and data transfers and access of 190 nsec (write) and 300 nsec (read).

The selectable base address for each of two memory banks includes mirror mode capability. The software-programmable access modes for each bank include read/write, read only, write only and no access, the vendor said.

The CPU-2 is a second-generation CPU board for the VME bus. It was designed for use in applications which require multiprocessor/multimaster capability, particularly in industrial control and multiuser micro systems.

The heart of the CPU-2 is the Motorola Corp. 68000 microprocessor. The standard board is delivered with the 8Hz version, and optional processors include the 10 MHz 68000 or the 68010 unit with virtual memory capability. The CPU resides on an eight-layer double Eurocard.

One feature of the CPU-2 is 256K bytes of dual-ported RAM. The RAM allows asynchronous, high-speed access from the local processor bus, as well as from the global VME bus. The RAM is expandable to 1M byte.

The additional I/O channels on the CPU-2 consist of a serial I/O multiprotocol RS-232C interface with software-programmable bit/sec rates; a parallel interface with 24 bidirectional I/O lines; and an on-board floppy disk controller, which can handle up to four 5¼-in. disk drives.

Operating software systems for the CPU-2 from Force Computers are the SYS68K/Coherent, a multiuser operating system, and the SYS68/Rtosk, a real-time operating system.

The unit price for the Dram-2 is $5,590; the CPU-2, including monitor, is $1,795, according to the vendor spokesman.

Force Computers, Suite 150, 2041 Mission College Blvd., Santa Clara, Calif. 95054.

ARIUM CORP.
Memory option

Arium Corp. has introduced two configurations of a nonvolatile memory option for its MLA100 logic analyzer.

The MLA100 samples data up to 32 channels wide at speeds of up to 100 MHz and has timing, state and disassembled code displays. It includes a 32-channel logic pod, the vendor said.

The basic setup memory option saves eight complete machine setups in permanent storage, even when the power is turned off, making it useful for field work and production testing, a company spokesman said.

The expanded version of the option includes the setup memory option plus an A/B memory option, which provides the ability to save, store, recall and edit a whole captured data memory set.

The basic nonvolatile memory option sells for $485, with the expanded version costing $795. Delivery is four weeks after receipt of order.

Arium, 1931 Wright Circle, Anaheim, Calif. 92806.

AUXILIARY EQUIPMENT

UNITED SOFTWARE SECURITY, INC.
Lazerlock

United Software Security, Inc. has announced Lazerlock, a hand-held decoder designed for computer security.

Lazerlock safeguards personal computers, mainframes and remote terminals, according to the vendor. Systems that use Lazerlock can insert security checks at any point in a program. Lazerlock does not use passwords or hardware encryption, according to the vendor.

Lazerlock is priced between $100 and $200, depending on the features required.

United Software Security, 6867 Elm St., McLean, Va. 22101.

MICROCOMPUTERS

Speech systems gaining ground

MICRO BITS

THOMAS MADRON

Speech systems are likely to become the major new I/O devices of microcomputing in the middle to late 1980s.

In the quest for user-friendliness, a number of devices have been proposed over the last few years. We have seen menu systems depending on key strokes, light pens, mice, touch screens and now, after 10 or 15 years of development, cost-competitive speech systems on microcomputers. Few techniques are more natural than being able to give a computer voice commands.

The ability to talk to a computer has been an image presented to us in science fiction for many years. HAL, the mentally ill computer in *2001, A Space Odyssey* by Arthur C. Clarke, depicted the computer as a villain. Then there was Mr. Spock's talking computer on board the *Enterprise* in the television show *Star Trek*. Those science fiction computers of the 60s possessed the ability to accept intelligent speech commands as well as to synthesize speech in order to respond to requests.

Fluent conversational speech recognition and response of the kind used on the *Enterprise* involve what artificial intelligence researchers have termed a "model of the domain of discourse" resulting in a recognition process called "understanding." The actual devices on the market in 1984, by way of contrast, are much simpler, using a pattern-matching technique rather than understanding.

Speech recognition can be defined in various ways. There are speaker-dependent and speaker-independent systems. HAL, in *2001*, used a speaker-independent approach — it was able to recognise the speech of all the crew members. Many of the contemporary 1984 systems are speaker dependent — they must be trained to recognize the speech of a single individual. The computers in both *2001* and on the *Enterprise* were also

See SPEECH page 74

Macintosh spurs software
From third-party vendors

By Jeffry Beeler
CW West Coast Bureau

Though officially introduced only two weeks ago, Apple Computer, Inc.'s Macintosh supermicro has already spurred the announcement of an assortment of third-party software packages and independently developed peripherals.

On the software side, the newly available Macintosh accessories include revised versions of five existing Microsoft, Inc. applications and a raft of other third-party packages, including:

- Xenix, Microsoft's Unix look-alike operating system, which will be supported by the recently introduced Lisa 2/10.
- An interactive, multitasking program development system from Creative Solutions, Inc.
- A rewrite of Software Publishing Corp.'s PFS line of information management programs.

On the hardware side, the list of independently supplied Macintosh-compatible accessories includes two peripherals from Tecmar, Inc. — a 5M-byte removable cartridge subsystem and a Bell 212A-compatible modem interface that reportedly replaces traditional telephones. Also available as peripherals with Apple's smallest 32-bit micro is a family of Davong Systems, Inc. hard disk modules capable of storing 5M to 40M bytes.

Ranging in estimated price from $1,995 to $4,500, the Davong disk systems will become available during the first quarter. Davong is located at 217 Humboldt Court, Sunnyvale, Calif. 94086. The Tecmar cartridge subsystem and phone modem interface cost approximately $2,000 and $300 to $500, respectively, and will be available late in the first quarter or early in the second from Tecmar at 6225 Cochran Road, Cleveland, Ohio 44139.

Macintosh also reportedly comes with an intelligent, front-end processor that allows the Apple micro to communicate with IBM or IBM-compatible central mainframes. Winterhalter, Inc.'s Data Talker II enables the personal computer to emulate IBM's 3200 series interactive displays as well as a broad selection of the industry giant's remote-batch terminals, according to a Winterhalter source.

With documentation, warranty and installation, the micro-to-mainframe link retails for $995 and can be obtained from Winterhalter at 3853 Research Park Drive, Ann Arbor, Mich. 48104.

See APPLE page 86

How are corporate micros working?

The dust from the corporate microcomputer boom is finally starting to settle. For many firms, the mad dash to buy and install microcomputers is giving way to developing plans for coordinating and controlling microcomputer use.

How are microcomputers working out in your organization? *Computerworld* will publish its second annual "Micros in Big Business" Special Report this April. This special section will focus on the success and failure of micros in large organizations. Included will be articles covering: micro-to-mainframe links, microcomputer networks, compatibility issues and the growing concern of security and data protection.

If you have a story you would like to share (either bitter or sweet), *Computerworld* would like to hear from you. Contributions should take one of two forms: a tutorial article discussing an issue or trend in corporate microcomputing, or a user story outlining a firm's experience with micros.

Articles must be typed, double-spaced and no longer than eight pages. Artwork, such as charts, graphs or photographs, is encouraged. Authors should also include a brief biography and a phone number where they can be reached.

The deadline for submissions is March 5. Articles should be addressed to: Donovan White, Special Reports Editor, *Computerworld*, 375 Cochituate Road, Box 880, Framingham, Mass. 01701.

IBM

IBM said it has begun volume shipments of its PCjr micro along with a dozen programs. In addition, IBM announced a free, dial-up assistance service for novice users and a $380 subscription software service that offers dial-up technical aid and a monthly newsletter.

Quality you expect, at a price you don't.

BECK DOUBLE DENSITY DISKETTES

SINGLE SIDED $2.19 ea. / $2.79 ea. DOUBLE SIDED

Our message to you is simple. If you like the quality of Dysan, Verbatim, 3M, et al, you'll like the quality of Beck soft sector

5¼" flexible diskettes. The only major difference is cost. We're less expensive. In fact, a lot less expensive.

Why does Beck cost less?

Our philosophy is: Excellent quality and reliability, at a cost that beats the jacket off other diskettes. We can do it because we (1) put our money into the product, not mega-marketing schemes and fancy packaging, and (2) sell our money-saving 25-diskette pack to you direct via a toll free order line, so you get fast, door-to-door service efficiently.

What about quality and reliability?

At Beck we take no shortcuts. You get the best because we are committed to excellence. Every diskette is manufactured to very strict quality standards.
• Full 7 Year Warranty • 100% Certified, 100% Error Free • Satisfaction, Money Back Guarantee
• Meets or Exceeds ANSI Standards

Order Now Toll Free (in New Hampshire call 924-3821)

1-800-BECK MFG

Door to Door in 48 hrs.

Order Toll Free 1-800-232-5634. Available in 25 pack only, plus freight. Double density, soft sector diskettes complete with hub reinforcing rings, Tyvek envelopes, color coded user labels, and nonmetallic write protect tabs.

SPEECH from page 73

able to recognize connected words rather than being limited to individual words separated by silence. Human speech and hearing deal mostly with the recognition and generation of connected words. Computers with the ability to recognize connected words are a reality in 1984.

The wedding of telephone technology with microcomputing is a somewhat natural outgrowth of the commercial availability of reasonably priced speech systems. Managers and other information workers spend a great deal of their time using the telephone. The ability to manage the use of the telephone, and the tools for doing so, can be an important means for productivity improvement. A major application, therefore, will likely be the use of a microcomputer as a super-intelligent telephone.

The product that engendered a certain amount of excitement for me was the introduction of the Speech Command System (SCS) for Texas Instruments, Inc.'s Professional Computer late last year. Not long after its introduction, I was able to obtain a speech command board and the associated software to review the system. At a list price of about $2,600, SCS is not an inexpensive peripheral, but it costs considerably less than many other commercial speech products.

At its inception, the SCS provided software support for three basic speech functions: telephone management, telephone sending and answering services and a transparent keyboard utility. The software package also includes a primitive daily calendar program as a throwaway since it doesn't use or depend on speech.

Part of the transparent keyboard facility is the ability to deal with the telephone through the "smartphone" option, which makes it possible to answer the phone (using a headset) with the computer. It is also possible to associate a spoken word or phrase with a telephone number. When the word is spoken, the associated phone number is dialed automatically. The numeric keyboard of the Professional can also be used as a normal telephone keypad when speech recognition has not been invoked.

Other telephone controls allow the user to transcribe a message, record it digitally on disk, then have the processor dial one or many phone numbers and deliver the message. In an office environment with several TI micros, it would be possible to set up a system of electronic mail using speech rather than written documents.

The SCS, through the use of the transparent keyboard facility, allows the association of spoken commands with characteristic keystrokes. The structure of the system is such that it uses a pattern-matching scheme, but can still cope with connected speech patterns.

Speaker-dependent system

A related set of commands are grouped together in a vocabulary. When a word is added to a vocabulary, it must first be enrolled, then trained through an updating process. It is, therefore, a speaker-dependent system. It is possible for me to speak the words, "Get me the directory on the Winchester," to obtain a directory listing. "Directory" and "Winchester" are keywords which are now accessible through the use of the SCS, but they can only be selected out by SCS when embedded in a larger document.

As implemented on the TI micro, speech recognition is limited to vocabularies of 50 words or phrases. Up to nine vocabularies can be active at any one time, depending on memory, so the 50-word limitation is not very severe. A technique is provided to go from one vocabulary to another.

While the SCS has voice synthesis capabilities, they are not implemented as general-purpose tools, although the speech playback features of the system are termed synthesis by the documentation.

TI has opted to produce a software development system that allows programmers to build new applications, but the price of that system is purported to be around $8,000. It was initially designed for the use of software developers. That price tag not only inhibits individuals from using it, but could retard development because it cuts out many small software houses.

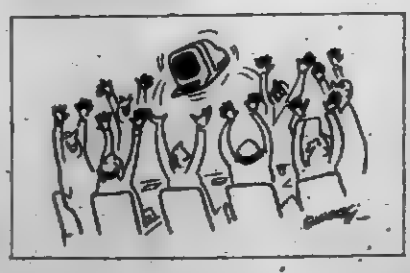
Whatever its shortcomings, the SCS is an exciting product. It is also unique in terms of the price compared with the capabilities of the system. It could be improved by providing a speech synthesis capability similar to that used by Votrax, Inc.

Keyboardless uses

In addition to providing a user-friendly computer environment, speech systems will likely find great use in situations where the user cannot be bothered by the keyboard (in some manufacturing processes, for example), for unique assistance to the handicapped and to simplify the tasks required in some jobs.

Over the next decade, I suspect that we will see speech systems become common on a wide variety of computers. The ability to talk to your computer will go a long way in providing a truly user-friendly computing environment.

Madron is manager of computer services at North Texas State University, Denton, Texas.



CUT YOUR COBOL TEST & DEBUG TIME

Our XPF/COBOL™ can slash COBOL test & debug time. XPF/COBOL is a full screen, interactive SPF-like test & debug facility, that can pay for itself in months.

Full screen debugging enables IBM MVS programmers to watch the program execute, find and change COBOL data in COBOL format, run multiple tests, and even watch the program run in reverse.

Call your nearest sales office today, or send in the coupon below, for complete information.

Send me information on XPF/COBOL.

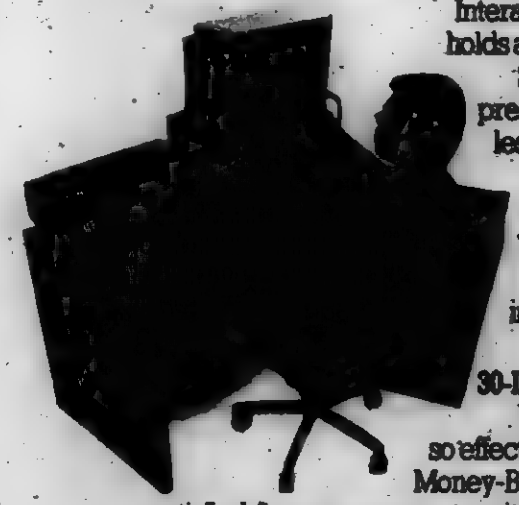
A WORD TO ANYONE LOOKING FOR UNIX™ TRAINING:

INTERACTIVE

Introducing Vision. The first UNIX Interactive Videodisc Training Curriculum.

Why interactive? Because it combines the power of the computer, the speed of a laser disc and the personality of classroom instruction. It engages; it motivates, it excites.



Interactive Videodisc Training captures and holds a student's interest in a way no other medium can.

Students learn by doing, so they learn faster, comprehend better and retain information longer. They spend less time away from the job. And are more productive once they return.

What's more, since the training is highly targeted, they learn only what they need to know to do the job. Now.

Who Developed Vision?

Vision was developed by Interactive Training Systems, the acknowledged leader in interactive video. And Computer Technology Group, a leader in UNIX training.

The result? A training curriculum that brings the concepts and language of UNIX to life.

30-Day Money-Back Guarantee.

Vision Interactive Videodisc Training is so fast, so effective and so affordable, we back it with a 30-Day Money-Back Guarantee. If you're not completely satisfied, for any reason, return it for a full refund. No questions asked.

Free Introductory Offer.

Lease all three Vision Courses for one year. And we'll give you the use of a complete interactive videodisc system. Free. You get an IBM PC, laser videodisc player, color monitor and Interactive Training System Controller. Absolutely Free.

Take advantage of our Free Introductory Offer. Send in the attached coupon. Or call us at 1-800-227-1127. And, yes, the call is Free too.

AFTER MARCH 31, 1984 OUR FREE INTRODUCTORY OFFER IS NO LONGER FREE!

☐ Please have a representative contact me immediately.

☐ Please send me more information about Vision, the UNIX Interactive Video Training Curriculum.

Figure $50 a line for programming.

When people look at business computers, they sometimes overlook a crucial consideration: the price of writing and maintaining software.

But we didn't. When we designed the HP 3000 family, we created special productivity tools to reduce the high price of developing applications software. With dramatic results.

Many HP 3000 customers now use 1/5th the amount of code writing these programs, compared with using high-level applications language. Since the average program costs you about $50 a line to develop, you can see why EDP budgets go so much further on an HP 3000.

You can use our development tools with the entire HP 3000 family. And, as all four systems are fully compatible, you can run the same, identical programs on your small branch office computer and on the big system in your regional headquarters. Without spending a penny to rewrite code or recompile.

Now divide by five.

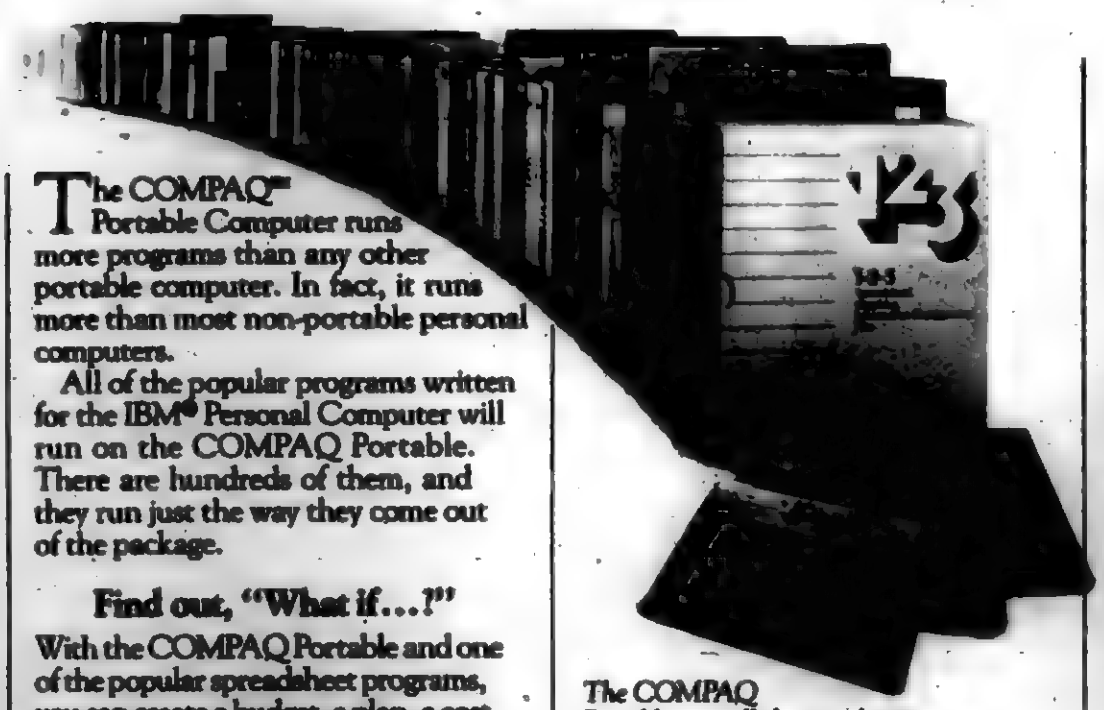
Features like these have helped many of our customers recoup the entire price of the hardware by cutting the time and effort involved in developing and maintaining the software.

So if you're looking for ways to lower your computing costs, take a look at the HP 3000. Call your local sales office listed in the white pages and ask a Business Computer Specialist about the HP 3000. Or write for more information to Tom Rappath, Hewlett-Packard, Dept. 03185, 19447 Pruneridge Avenue, Cupertino, CA 95014. In Europe, write to Henk van Lammeren, Hewlett-Packard Nederland B.V., Dept. 03185, P.O. Box 529, 1180 AM Amstelveen, The Netherlands.

HEWLETT PACKARD

Computer stores were full of programs for the COMPAQ Portable before there *was* a COMPAQ Portable.

Here's why.



The COMPAQ Portable runs all the popular programs written for the IBM Personal Computer.

The COMPAQ™ Portable Computer runs more programs than any other portable computer. In fact, it runs more than most non-portable personal computers.

All of the popular programs written for the IBM® Personal Computer will run on the COMPAQ Portable. There are hundreds of them, and they run just the way they come out of the package.

Find out, "What if...?"

With the COMPAQ Portable and one of the popular spreadsheet programs, you can create a budget, a plan, a cost analysis or an estimate. In minutes you can do updates that normally take hours. You can examine several alternatives in less time than it would take to do a single problem by hand.

Spend more time thinking and less time crunching numbers.

Money management made portable

With the COMPAQ Portable you can take advantage of financial programs for professional money management.

Receivables programs tell you who owes money and since when. Payables programs give you control of outgoing cash. General ledger programs record financial histories. Payroll programs keep records and generate checks. Inventory management programs help you control investment.

You can take computerized accounting wherever you need it and keep closer contact with your company's financial status.

Word processing to go

Imagine the power of a *portable* word processor. Choose from a wide variety of programs to meet your specific writing application with the COMPAQ Portable.

With word processing programs and an optional printer you don't have to start fresh when you need to make revisions. You can change formats, move paragraphs, and automatically search for the parts that need to be updated.

In other words, you can work smarter—not harder.

Computer conversations

There are a number of communications expansion boards and programs available for the COMPAQ Portable.

Some allow you to access a variety of central computers over the phone. You can have headquarters information wherever you travel.

With others you can pull facts from data banks on thousands of topics.

Others enable you to send electronic mail.

A world of business information is available wherever you and the COMPAQ Portable go.

...and lots of others

There are programs for designing graphs and charts, for tracking complicated schedules, and for electronic filing. There are powerful integrated programs that let you perform several tasks after entering data only once.

The wealth of programs and convenience of portability make the COMPAQ Portable the most useful personal computer on the market.

The COMPAQ Portable comes standard with one 320K byte diskette drive and 128K bytes of memory. A second diskette drive and additional memory are available.

The bottom line is this—you just can't buy a more practical, useful, productive computer.

For the location of the Authorized Dealer nearest you, call 1-800-231-0900.

Geisco joins ranks of IBM remarketers

ROCKVILLE, Md. — Continuing a trend of time-sharing vendors marketing specialized versions of IBM Personal Computers, General Electric Information Services Co. (Geisco) has thrown its hat into the IBM value-added remarketer arena.

According to a Geisco spokeswoman, the company will offer Personal Computers along with systems consulting, assistance in hardware selection, installation, testing and training on custom and package applications. The spokeswoman added that a typical configuration available through Geisco includes the IBM Personal Computer or Personal Computer XT, modem, graphics printer and communications software.

Depending on the configuration, prices begin at approximately $6,000, plus application software.

In connection with the announcement, Geisco introduced what it called four software enhancements for the IBM Personal Computer. The enhancements include the Time Sharing Interface (TSI) Version 2.0, which was described as a communications package to link the microcomputer to General Electric Co.'s worldwide teleprocessing network.

Geisco also made available Tabol, a financial management system that features a file option that enables it to read or write data files compatible with Visicorp's Visicalc package. The Tabol-Visicalc interface provides a means to consolidate multiple sets of Visicalc data, and it allows Visicalc data files to feed Tabol production application systems. Data transfer from Visicalc to Geisco's Mark III teleprocessing service is said to allow for more complex Tabol processing, reporting, consolidation, data base management and graphics.

Geisco's Fortran Subroutines Library includes hardware-related routines such as the ability to modify keystroke functions for creating boxes and windows, creating graphics and managing communications and files.

The IBM Personal Computer Hierarchical Indexed Sequential Access Method (Hisam) data base software introduced by Geisco facilitates development of applications that couple Geisco Mark III Service hosts and the Personal Computer, according to the spokeswoman.

For Geisco clients, TSI Version 2.0 is priced at $50 a copy, the Fortran Subroutines Library is priced at $495 and the Personal Computer-Hisam system is priced at $300. The Tabol Visicalc interface is included in the cost of Geisco's Mark III teleprocessing service.

Geisco, 401 N. Washington St., Rockville, Md. 20850.

Phaze unveils Gemini, boasts IBM capability

SCOTTSDALE, Ariz. — Phaze Information Machines Corp. has introduced its 3270/Business Computer called Gemini.

According to a company spokesman, the system combines the capabilities of an IBM 3278 CRT terminal with IBM Personal Computer-compatible operations and software.

Gemini can alternate between concurrent 3270 and Personal Computer modes via single keystroke keyboard commands without loss of session. The file transfer capability allows for the transfer of data from the mainframe to the personal computer for editing and for the return of that information to the host.

The extended capabilities of Gemini permit the data transfer to be performed in a number of different ways.

As a business computer, Gemini uses an array of software compatible with the IBM Personal Computer, including Lotus Development Corp.'s Lotus 1-2-3, Microsoft, Inc.'s Multiplan, Visicorp's Visicalc, Micropro International, Inc.'s Wordstar and Metasoft Corp.'s Benchmark, according to the spokesman.

Two 5¼-in. 320K-byte disk drives and 128K bytes of random-access memory (upgradable to 256K bytes) are standard features of Gemini, which will operate under MS-DOS, PC-DOS and CP/M 86.

Gemini connects directly to IBM 3274 or 3276 controllers via coaxial cable. It supports light-pen functions and has additional features such as reverse video, attribute display, automatic video shutdown and security key lock.

The Gemini uses an 87-key typewriter keyboard with 24 program function keys as standard features; other options are available, the vendor noted.

Gemini will be available for shipment the first of the year. The single-unit price is $4,250.

Phase Information Machines, 7650 E. Redfield, Scottsdale, Ariz. 85260.

Computer Communications?

Whether it's office to office, office to corporate computer or office to data base service, Polygon software delivers reliable data transfer.

We've been developing communications software for micros, minis and mainframes for over five years. Experience that has paid off with comprehensive programs, documentation and effective menus for optimum user performance.

It's simple. Whether you use a modem, direct cabling or local area networks, our software talks directly from computer to computer. One more good reason why Digital Equipment Corporation and Interlan, Inc. sell and support our communications software with their products.

So, if you want to communicate, and you want to do it economically, reliably and easily, communicate with us...we're Polygon Associates.

We have the software...

poly-TRM™ Asynchronous Terminal Emulation Software: For communication as a terminal to virtually any computer system including the Source[1], Dow Jones[2] and other commercial information services.

poly-BSC/RJE™ Bisynchronous Terminal Emulation: For Remote Job Entry (IBM 3780/2780) to IBM mainframes and compatible machines.

poly-BSC/3270™ Bisynchronous Terminal Emulation: For emulation of the IBM 3270 family of Information Display Systems, including file transfer.

poly-XFR™ File Transfer Software: For error-free ASCII and Binary file transfers among personal and minicomputers.

For all types of hardware...

Minicomputers using VMS, RSTS/E, RT-11 and RSX-11M Operating Systems[3]; Intel and Motorola development systems. Systems using CP/M[4] in a user tailorable version.

Plus we support personal computers from the following manufacturers: Apple Computers, Inc., Digital Equipment Corporation, International Business Machines Corporation, Jonos, Osborne Computer Corporation, Radio Shack/Tandy Corporation, Televideo Systems, Inc., Victor Technologies, Inc. and Xerox Corporation.

1 The Source is a service mark of Source Telecomputing Corporation, a subsidiary of the Reader's Digest Association, Inc.
2 Dow Jones is a trademark of Dow Jones, Inc.
3 VMS, RSTS/E, RT-11 and RSX-11M are trademarks of Digital Equipment Corporation.
4 CP/M is registered to Digital Research, Inc.

Fujitsu unveils Micro 16s

LOS ANGELES — Fujitsu Systems of America has introduced the Fujitsu Micro 16s, a microcomputer which incorporates both 8- and 16-bit microprocessors.

According to the vendor, the microcomputer is suited for use with the firm's 7850 and 7990 point-of-sale terminals and 7110 terminal-support processor. It incorporates interchangeable microprocessors, including an 8-bit Zilog, Inc. Z80A microprocessor and an Intel Corp. 16-bit 8086 microprocessor.

The system offers 128K bytes of memory, which can be expanded to 1M byte of internal storage. It features two minifloppy disk drives with 320K bytes of auxiliary memory on each and a 98-key keyboard, including 10 user-programmable keys and a separate numeric pad, the vendor said.

The Micro 16s comes standard with Digital Research, Inc.'s CP/M 86 operating system and is bundled with Micropro International Corp.'s Wordstar word processing program, Sorcim Corp.'s Supercalc 2 electronic spreadsheet and Digital Research's GSX graphics software.

The base system price of the Micro 16s is $3,695.

Fujitsu Systems of America, 2841 Airport Blvd., Los Angeles, Calif. 90045.

MDB Micro/32 debuts

ORANGE, Calif. — MDB Systems, Inc. has introduced the MDB Micro/32, a 32-bit computer system that features the Motorola, Inc. 68000 microprocessor and the vendor's Regulus, a Unix-compatible operating system.

The MDB Micro/32 contains a single quad-size CPU board and 512K bytes of random-access memory.

The Regulus operating system features user source compatibility with Unix V6, 7 and System III and offers support of all Unix kernel features, multikey B-tree Isam and Digital Equipment Corp. VAX/PDP-11 cross-support, according to a vendor spokesman.

The MDB Micro/32 is priced at $11,995, including a Regulus user license. Discounts for quantity purchases are available, the spokesman said.

MDB Systems, 1995 N. Batavia St., Orange, Calif. 92665.

SYSTEMS

D.J. DESANDRO & CO., INC.
Simple Librarian System

D.J. DeSandro and Co., Inc. recently announced software and hardware package designed for applications where extensive cross-referencing is desired, such as for libraries, medical offices, legal offices and so forth.

The Simple Librarian System includes an OSM Computer Corp. Zeus 4 microcomputer with a 1.2M-byte, 5¼-in. floppy disk drive and 5¼-in. hard disk drive. Storage capacities range from 6.3M bytes to 25M bytes. Also included with the system is OSM's Muse operating system with features said to be similar to Digital Research, Inc.'s CP/M and MP/M systems.

A basic package includes the Zeus 4, two CRT terminals and one letter-quality printer for $10,000. The system reportedly can support up to 10 CRT terminals.

D.J. DeSandro and Co., P.O. Box 19786, Houston, Texas 77027.

SWEDA INTERNATIONAL, INC.
9800 Retail Control System; Sweda Business System

Sweda International, Inc., a division of Litton Industries, has introduced the 9800 Retail Control System and the Sweda Business System. The two products are aimed at point-of-sale users.

The 9800 Retail Control System is said to be a general-purpose, distributed processing computing system consisting of up to 64 microprocessor-based devices integrated into a dedicated local-area network, the vendor said.

Musys Corp.'s Turbodos operating system controls the multiuser network and shares a common pool of 5¼-in., slim-line and full-height mass storage devices. Configurations from a single 320K-byte floppy disk through multiple drives with up to 600M bytes of storage are offered, the vendor said.

The 9800 series point-of-sale terminal is also programmable in higher level languages, the vendor said. The local-area network utilizes coaxial cable and operates at a data rate of 800K bit/sec., utilizing carrier-sense, multiple access/collision detection, according to a spokesman for the vendor.

The Sweda Business System was designed to integrate a range of Sweda point-of-sale devices, including the 9800 Retail Control System, with local and corporate-level processing capabilities.

The basic Sweda Business System includes an 8-MHz, 16-bit processor, 256K bytes of memory, monochrome CRT, keyboard, RS-232-C serial ports, a parallel printer port and a universal power supply. Optional

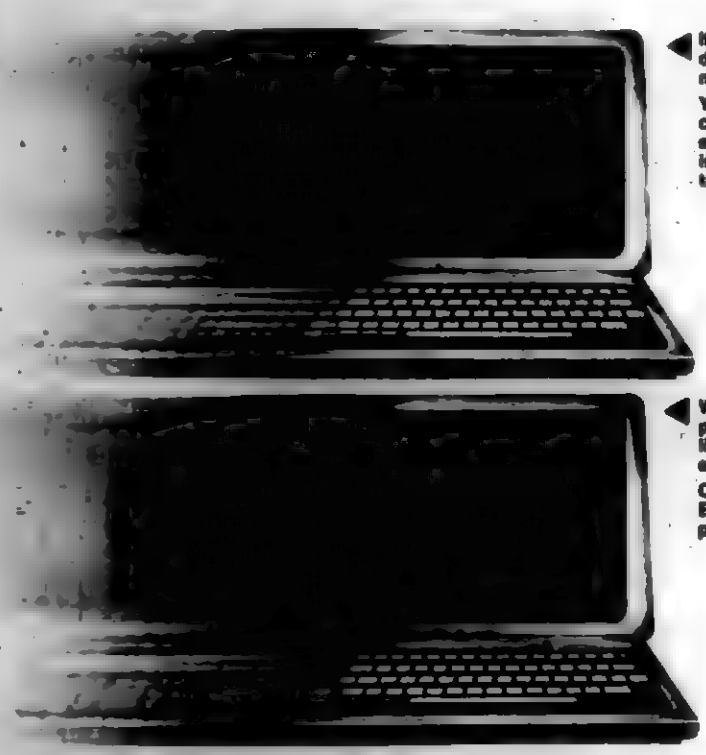
THE ENCRYPTOR™
Data Security at An Affordable Price



If your microcomputer data looks like this, it's not secure.
Your confidential reports, client or customer files, and other critical business information can be tampered with or stolen.

With THE ENCRYPTOR™ products, your data looks like this — and it's totally secure.
Only individuals with Encryptor keywords can process your data.

Please send me information about The Encryptor™ products. I'm particularly interested in:
☐ Stand-alone micro application
☐ Micro-to-micro application
☐ Micro-to-mainframe application
☐ Total system application

Futurex Security Systems™
A Division of Jones Futurex™ Inc.
9700 Fair Oaks Boulevard
Fair Oaks, CA 95628

By physically transforming data, THE ENCRYPTOR™ products provide complete protection for stored or transmitted information. They eliminate unauthorized access, manipulation, or theft of such confidential information as:
- Corporate trade secrets
- Customer or client files
- Electronic fund transfers
- Personnel records

THE ENCRYPTOR™ products are reliable, high-speed devices that can be applied to micro-to-mainframe, micro-to-micro, and stand-alone micro configurations. They comply with the national Data Encryption Standard (DES) and allow for implementation of Message Authentication Code (MAC) for electronic fund transfers.

THE ENCRYPTOR™ products offer the easy-to-use, cost effective solution to your data security problems. For more information, return the coupon or call Futurex Security Systems™ at 800-251-5112 (800-251-5111 inside California).

Communications.

How to tie things together today without being tied down tomorrow.

This April, *Computerworld Office Automation* will give you a close look at the world of communications products and services. You'll read about what's out there now and what's coming. And how to get started while leaving your architecture open for the technologies of the future. And you'll get it all from the perspective of end users who have to increase productivity *now* while making sure the their company's investment won't be obsolete in two years.

And that's not all. There'll be feature articles on:

- PBX *versus* local area networks and how they'll merge
- voice technology
- videoconferencing technology
- satellite technology
- inter and intra company communications strategies
- product evaluations and comparisons

And after we cover all the developments for you, we'll offer you strategies to link them all together into one integrated system.

Computerworld Office Automation is designed to give you OA information geared to the DP/MIS environment — in a way that no traditional office publication can. As one of *Computerworld's* 114,000 subscribers in the U.S, you'll get six issues of *Computerworld Office Automation* in 1984 — as part of your subscription! And if your users need to increase their communications links, you won't want to miss this issue devoted to Communications in the office.

If you've got office automation and office communication products our readers should know about, then you need to get your ad reservation in by March 2nd.To reserve ad space in this April 11th issue of *Computerworld Office Automation*, call one of the sales offices listed below, or Ed Marecki, National Sales Director at 617-879-0700.

To: Ed Marecki, *National Sales Director*
CW Communications/Inc.
Box 880
Framingham, MA 01701

☐ *Please send me advertising information on Computerworld Office Automation.*

☐ *Please have a sales representative call me.*

MICROCOMPUTERS

Continued from page 60

hardware components include 256K bytes of memory increments, an 8-color CRT with bit-mapped graphics, 5¼-in. floppy disk drives and various floppy/rigid disk drive combinations, the vendor said.

The Retail Control System costs $3,000, and the basic Sweda Business System costs $3,000.

Sweda International, 34 Maple Ave., Pine Brook, N.J.

MOSTEK CORP.
VME Matrix 68K

Mostek Corp. has introduced a multiuser system designed around the firm's MK68000 microprocessor.

The VME Matrix 68K combines the expandable 16-bit VME bus with the Unix operating system, meeting the requirements of current 16-bit applications. The unit can be expanded to support 32-bit applications in the future.

According to the vendor, the system features a 10-slot card cage with three slots available for system expansion, allowing the user to select those functions needed for a specific application. It has 640K bytes of main memory and five serial ports.

A 36M-byte Winchester disk drive and a 5¼-in. double-sided, double-density floppy disk drive are also supplied with the system.

The single-unit price is $16,500.

Mostek, 1215 Crosby Road, Carrollton, Texas 75006.

PRINTERS/ PLOTTERS/ PERIPHERALS

FUTURENET CORP.
D1 Plothp

Futurenet Corp. has introduced D1 Plothp, a pen-plotter interface which prints graphics created with an IBM Personal Computer on Hewlett-Packard Co.'s 7580, 7585 or 7470 plotters.

The interface works Futurenet's Dash-1 Schematic Designer and produces C- and D-size schematics for engineers, according to the vendor. The interface produces output on sheets of paper, vellum or double-matted polyester film.

The interface is priced at $600.

Futurenet, 21018 Osborne St., Canoga Park, Calif. 91304.

BLUE CHIP ELECTRONICS, INC.
Model M120/10

Blue Chip Electronics, Inc. has announced a 120 char./sec dot matrix printer designed for direct interface with the Commodore Business Machines, Inc. Commodore 64 personal computer.

The Model M120/10, now available, has a standard Centronics Data Computer Corp. parallel interface

STEARNS COMPUTER SYSTEMS CORP.
Optional 54-line feature

Stearns Computer Systems Corp. has added an optional 54-line feature to its 12-in. or 15-in. terminals. The terminals are used on the firm's desktop microcomputer.

The 15-in. terminal features full-page, white-on-black display. The 12-in. terminal uses black-and-white, green, amber or eggshell characters. A 15-in. display is also available.

The terminals, with expansion board and software, add approximately $1,300 to the purchase price of a Stearns microcomputer.

Stearns Computer Systems, 10901 Bren Road, Minnetonka, Minn. 55343.

and the capacity to accept optional RS-232C serial and IEEE-488 interfaces.

The suggested retail price for the printer is $349.

Blue Chip Electronics, 7406 E. Butherus Drive, Scottsdale, Ariz. 85260.

STORAGE

APPLE COMPUTER, INC.
Duodisk

Apple Computer, Inc. has introduced a floppy disk drive unit that contains two half-high, 140K-byte drives side-by-side in a single case.

Called Duodisk, the unit offers compatibility with Apple II software. A spokesman said the unit costs less than two separate Disk II drives. The Duodisk meets the dual-drive configuration needed for many software programs, the vendor said.

Duodisk is the same width as the Apple II and can be placed between the computer and the monitor. Technical features include a disk-ejection mechanism and an advanced head-positioning mechanism that, according to the vendor, gives a more precise reading of half-tracks.

Duodisk comes with a controller card that connects it to any Apple II, Apple II+ or Apple IIe.

Apple Computer, 10260 Bandley Drive, Cupertino, Calif. 95014.

BOARD-LEVEL DEVICES

VIRTUAL MICROSYSTEMS, INC.
Spectrum

Virtual Microsystems, Inc. has announced Spectrum, a board which transforms a Digital Equipment Corp. VT-100 terminal into a microcomputer.

Spectrum features 512K bytes of random-access memory, Intel Corp.'s 80186 and 8088 and Zilog, Inc.'s Z80 microprocessors, according to the

The 80186 microprocessor provides back-end host communications at a speed of 56K bit/sec. The 8088 provides 256K bytes of storage for Microsoft, Inc.'s MS-DOS operating system. The Z80 allows the user to run programs on Digital Research, Inc.'s CP/M operating system.

Spectrum does not include a floppy disk drive, so any microcomputer software has to be loaded by a hardware utility and accessed by the terminal.

The board costs $2,450; mainframe software prices range from $1,600 to $3,500.

Virtual Microsystems, Suite 720, 2150 Shattuck Ave., Berkeley, Calif. 94704.

CURTIS, INC.
Romdisk

Curtis, Inc. has announced Romdisk, an accessory card for the Apple Computer, Inc. Apple II that provides one full diskette of user-stored program files loaded in erasable programmable read-only memory (Eprom).

With Romdisk, a menu-builder program is provided to allow selection of the program files to be loaded, and Romdisk can automatically generate the menu or desired program file.

Romdisk may be used in on-line systems and is said to allow Apple II microcomputers to be used as workstations without handling diskettes. Up to four Romdisks can be used in one microcomputer, the vendor said.

Romdisk requires either the DOS 3.33 or Prodos operating system and will allow programs that can be copied using operating system utilities to be user-loaded into the Romdisk Eprom memory.

Romdisk is priced at $499.

Curtis, 22 Red Fox Road, St. Paul, Minn. 55110.

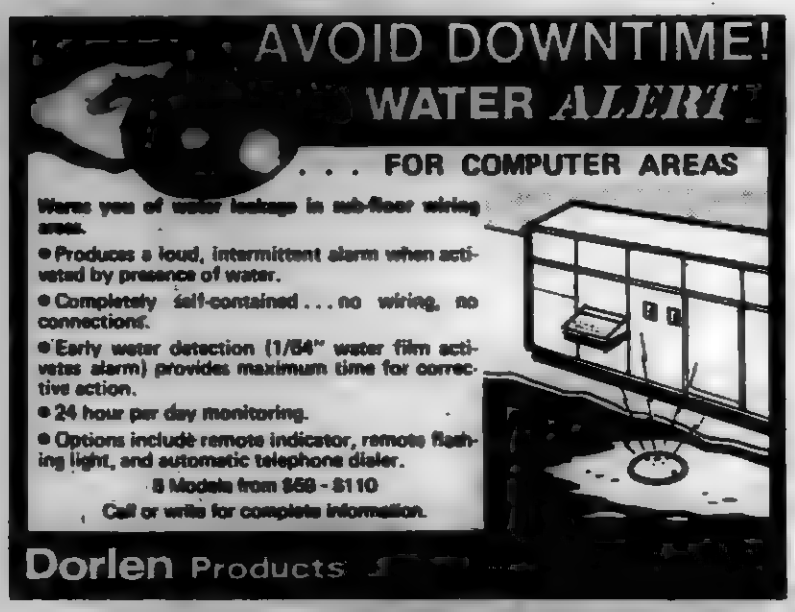
HEURIKON CORP.
MLZ-92A

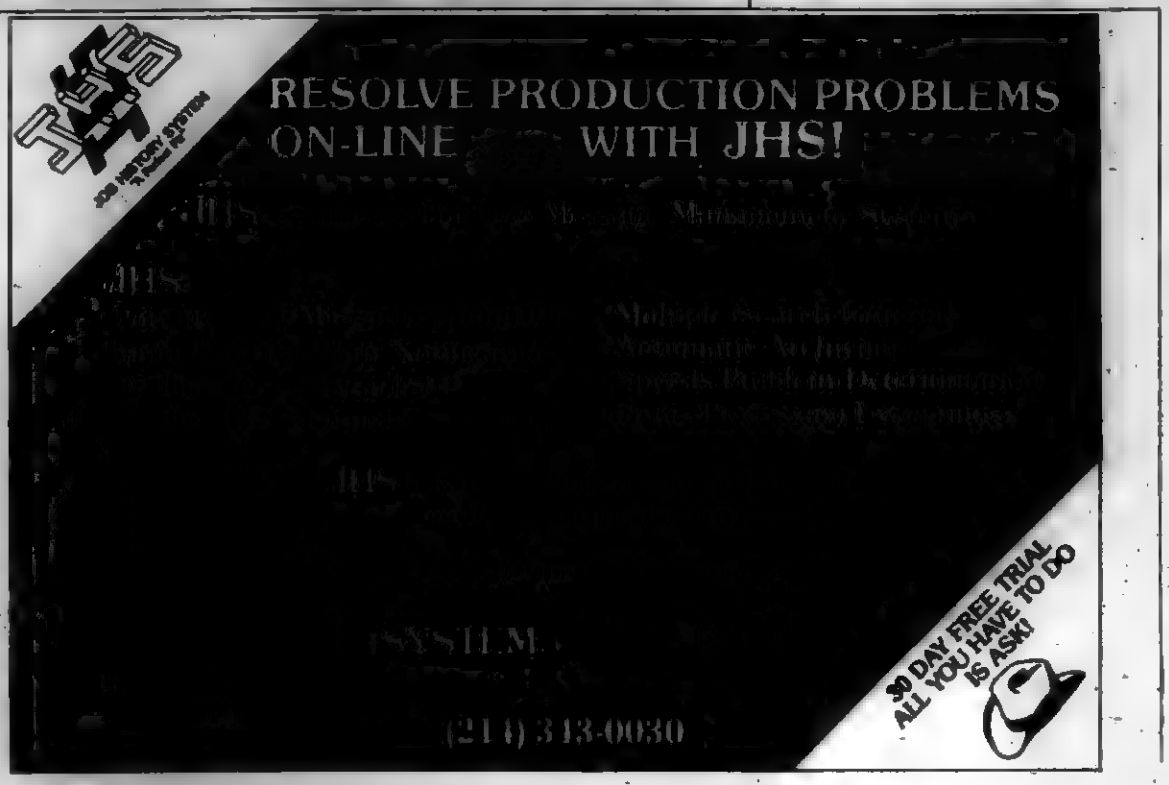
Heurikon Corp. has announced a single-board processor designed to run multiuser operating systems without additional cards on its Intel Corp. multibus systems.

The MLZ-92A is now available for OEMs and for sale as a stand-alone unit, according to the company.

The MLZ-92A features the Zilog, Inc. Z80A microprocessor and Digital Research, Inc.'s CP/M operating sys-

Continued on page 64





"The computer is down."

Every day another business goes "on line." Every day the world becomes more dependent on computers. And every day it becomes more important for the world to have a computer that won't go down, or even skip a heartbeat.

Over the past decade there have been computers designed to withstand hardware failures and eliminate downtime. However, all previous approaches depend heavily on software techniques to provide fault tolerance. A comparison of these old systems with the new Stratus/32 Continuous Processing™ System will illustrate how far we have come in one leap, by using advanced hardware technology instead of complex software.

How the Stratus Hardware Solution Supersedes the Software Solutions.

Stratus's hardware design means that fault tolerance is invisible to your application programs and users. You can even move previously developed applications to Stratus with NO CHANGES and NO PERFORMANCE LOSS for fault tolerance. In contrast, the software-based systems require complex, performance-stealing software in order to implement fault tolerance. This means that new programs are more difficult to develop, they run slower, and existing programs can't be run without major changes.

An added benefit of the Stratus fault tolerant design is that you can expand your system with additional processors as your computing needs grow. In fact, you can have up to 32 fault tolerant processors, 2000 communication lines, and 100 billion bytes of storage in a single Stratus system.

Hardware Self-checking Causes a Breakthrough in Service.

Each Stratus/32 tests itself EIGHT MILLION TIMES A SECOND while it executes your programs, so faults are detected BEFORE they corrupt your data. And when there is a failure, there's no need to rush to call your Stratus service technician. For one thing, the failed component, be it a CPU, controller, disk, or power supply, has a partner that continues operations as usual (without slowing down the system), so there's NO DOWNTIME. In addition, repairs can be made WITHOUT STOPPING THE SYSTEM. It is so easy to repair a Stratus/32 that our service is provided at about one-half the average price charged by other computer manufacturers.

$140,000, Software Included.

Our prices are competitive with "normal" systems (i.e. ones that do not provide fault tolerance), and substantially lower than the software-based fault tolerant systems. $140,000 buys you a complete four megabyte 32-bit system with 60 megabytes of disk storage, magnetic tape drive, and system SOFTWARE. If you like our hardware, you will be even more impressed with our software. (A common reaction among our users.) Briefly, our software offering includes VOS (a virtual operating system), transaction processing, networking, IBM communications, data management system, interactive forms builder, symbolic debugger, COBOL, Basic, PL/1, Fortran, Pascal, word processing...

To get more information call us at 617-653-1466.

The computer you can count on has arrived.

Stratus

CONTINUOUS PROCESSING™

Now that the world relies on computers it needs a computer it can rely on.

MICROCOMPUTERS

Continued from page 82

tem. It is said to have 128K-byte parity, protected random-access memory and the ability to access 1M byte through its 20-bit, memory-mapped multibus interface.

Off-card I/O can be accessed through the I/O map, and hardware arbitration allows communication with the multibus in the master, slave or multimaster mode, according to the company.

It features four RS-232 serial ports, two of which can be configured for RS-422, while an optional Centronics Data Computer Corp.-compatible parallel interface is available.

The MLZ-92A is priced at approximately $1,150 in quantities of 100.

Heurikon, 9001 Latham Drive, Madison, Wis. 53713.

AUXILIARY EQUIPMENT

COMPUTER LITERACY, INC.
Compututorial

Computer Literacy, Inc., an educational systems company, has introduced audio cassette training programs called Compututorial.

The first Compututorial has been developed to train users of the PFS: File program on the IBM Personal Computer. The package provides marketing opportunities for the retailer, a company spokesman said.

Compututorial is priced at $39.95.

Computer Literacy, P.O. Box 49146, Cincinnati, Ohio 45249.

MICRO LOGIC CORP.
Micro Chart No. 7

Micro Logic Corp. has introduced the Micro Chart, a plastic reference card for programming Intel Corp. 8086 and 8088 microprocessors.

According to the vendor, the card is No. 7 in a series and covers conversion of instructions to and from hexadecimal instruction descriptions, cycle time, addressing modes, flag codes and diagrams on a two-sided, two-color, full-page sheet.

Micro Chart No. 7 costs $5.95, plus $1 for postage.

Micro Logic, P.O. Box 174, 100 Second St., Hackensack, N.J. 07602.

FLIPTRACK LEARNING SYSTEMS
Audio cassette tutorials

Fliptrack Learning Systems has published audio cassette tutorials for users of the IBM Personal Computer XT using Lotus Development Corp.'s 1-2-3 financial spreadsheet package.

"How to Operate the IBM XT" was designed to teach the user how to utilize the XT's special keys and commands; load and run basic programs; format, copy and check diskettes; and copy, rename and erase individual files.

"How to Use Lotus 1-2-3" instructs the user on all the essential 1-2-3 commands and built-in functions needed to develop spreadsheets, data bases and graphics presentations. It also discusses how to sort and select entries and how to display and print results in a variety of formats, the vendor said.

Both tutorials consist of four spoken-voice cassettes that require about two hours each and may be played on any standard cassette player. The tutorials are available from the vendor for $75 each.

Fliptrack Learning Systems, Suite 200, 999 Main St., Glen Ellyn, Ill. 60137.

PRENTICE CORP.
Popcom Model X100

Prentice Corp. has announced the Popcom Model X100 communications modem for users of personal computers and microcomputers.

The voice and data-handling feature of the modem includes call-progress monitoring and detection for dial tones, busy signals, remote ringing, voice, data and line-current disconnect. The modem is compatible with 103, 113 and 212A dial-up modems and connects to all standard single- and multiline phone equipment, the vendor said.

The modem offers compatibility with currently available communications software packages and adapts to a variety of RS-232 interface cables, according to the vendor. The price is $475.

Prentice, 366 Caspian Drive, P.O. Box 3544, Sunnyvale, Calif. 94088.

MEMOREX CORP.
Type D, Type E disks; head-cleaning system; data cassette

Memorex Corp. has announced single- and double-sided 5¼-in. floppy disks, both with 96 track/in., a 5¼-in. disk drive head-cleaning system and a 15-min. data tape cassette.

The single-sided Type D and double-sided Type E disks are said to provide twice the storage capacity of standard double-density disks. The head-cleaning system is inserted as an ordinary disk for 30 seconds and may be used up to 30 times. The data cassette provides storage of up to 72K bytes and is said to provide faster data loading and access.

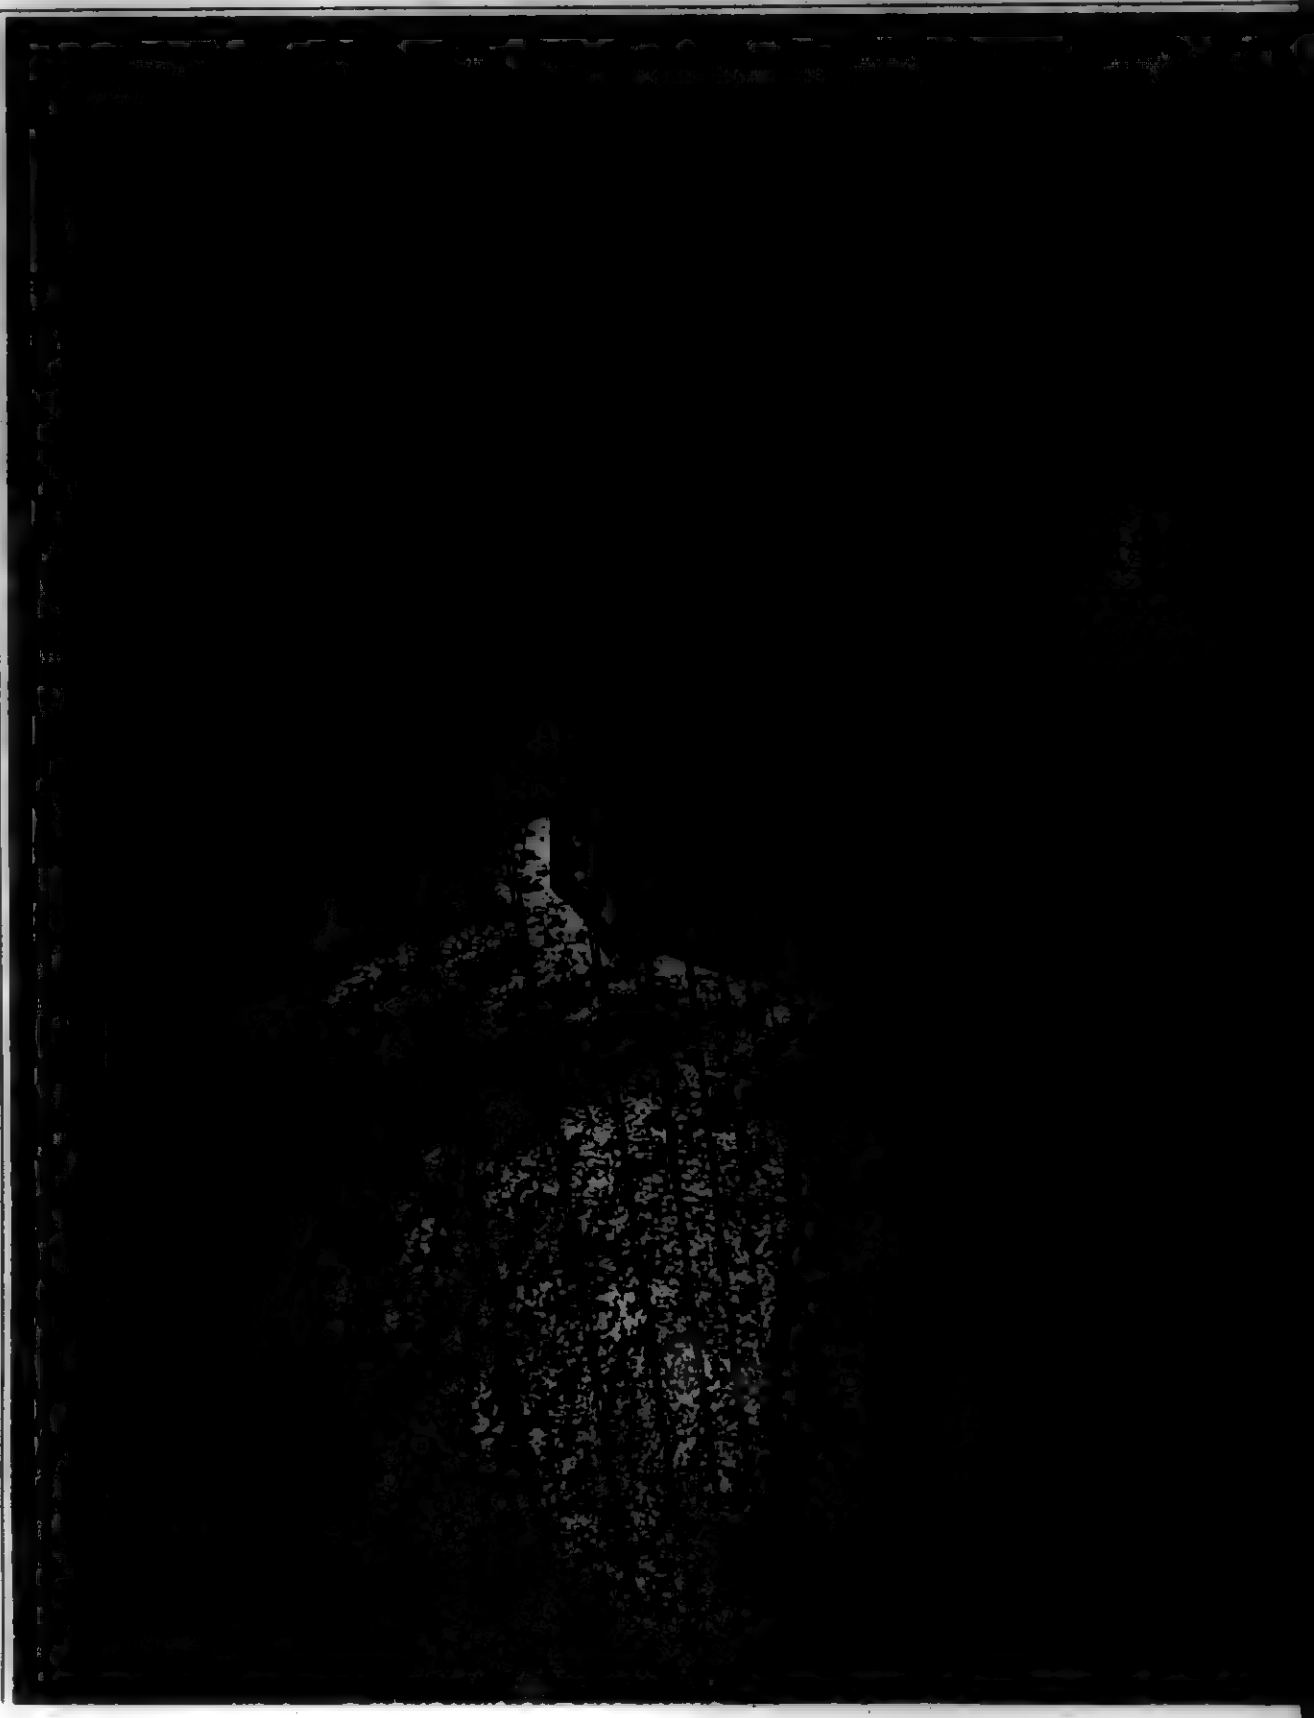
Suggested prices are: Type D disk, $49.99; Type E disk, $68.99; head-cleaning system, $21.49 for package of 10; and data cassette, $3.39.

Memorex, San Tomas at Central Expwy., Santa Clara, Calif. 95052.

MICRO SOFTWARE

SOFTWARE PUBLISHING CORP.
PFS:Access

Software Publishing Corp. recently announced a software communica-



MICROCOMPUTERS

tions package said to provide data encryption along with access to dial-up services for users of microcomputers running under Microsoft, Inc.'s MS-DOS and on Apple Computer, Inc.'s Apple IIe.

PFS:Access reportedly stores dial-up and logon sequences to connect users automatically to frequently used services, including electronic mail services provided by Western Union Corp.'s Easylink and MCI Communications Corp.'s MCI-Mail; data base services provided by Dow Jones & Co.'s Dow Jones News Retrieval, Source Telecomputing Corp.'s The Source and Compuserve Corp.'s Compuserve; and Bankamerica Corp.'s Home Banking service.

Users reportedly can select connection to a service by pushing one key. The package works with many serial interface cards and supports most popular modems with 300 bit/sec and 1,200 bit/sec transmission speeds, according to a spokesman for Software Publishing.

The MS-DOS version will be available in March for a suggested retail price of $95, and the Apple version will be available in May for a suggested retail price of $70.

Software Publishing, 1901 Landings Drive, Mountain View, Calif. 94043.

RESPONSE, INC.
PC/Coder Version 2.06

Response, Inc. recently announced an enhanced release of its program development system for the IBM Personal Computer and Personal Computer XT that reportedly includes a 20% to 25% faster program generation routine.

Release 2.06 of PC/Coder also provides function key usage and additional user-defined error trapping routines, according to a company spokesman.

The enhanced version is available to licensees of previous versions at no charge. PC/Coder is priced at $450.

Response, 606 2nd St., Jackson, Miss. 56143.

VIA COMPUTER, INC.
Micro/Prophit

Via Computer, Inc. has introduced Micro/Prophit, a financial modeling system for the IBM Personal Computer and Personal Computer XT.

According to the vendor, the system was previously only available through Control Data Corp.'s time-sharing services.

Micro/Prophit is an enhanced version of the vendor's Propfit II, expanding its power and capabilities. It is an alternative to planning tools such as Lotus Development Corp.'s Lotus 1-2-3 and Visicorp's Visicalc, a company spokesman said.

According to the vendor, Micro/Prophit uses an MS-DOS operating system with a minimum of 192K bytes of memory. The package allows users to develop model sizes of up to 9,000 lines by 126 col.

Micro/Prophit is priced at $695.

Via Computer, 7177 Construction Court, San Diego, Calif. 92121.

NOVELL, INC.
Netware/O

Novell, Inc. has announced that its network operating system software, featuring a mainframe-like file server with security management capabilities, is now available for the Cervus Systems, Inc. Omninet network.

The package, called Netware/O, allows up to 64 IBM Personal Computers, Personal Computer XTs or similar systems to share up to 150M bytes of disk storage attached to a central Netware file server.

Netware/O provides information-sharing functions to support transaction processing, record locking and direct communications between networked stations.

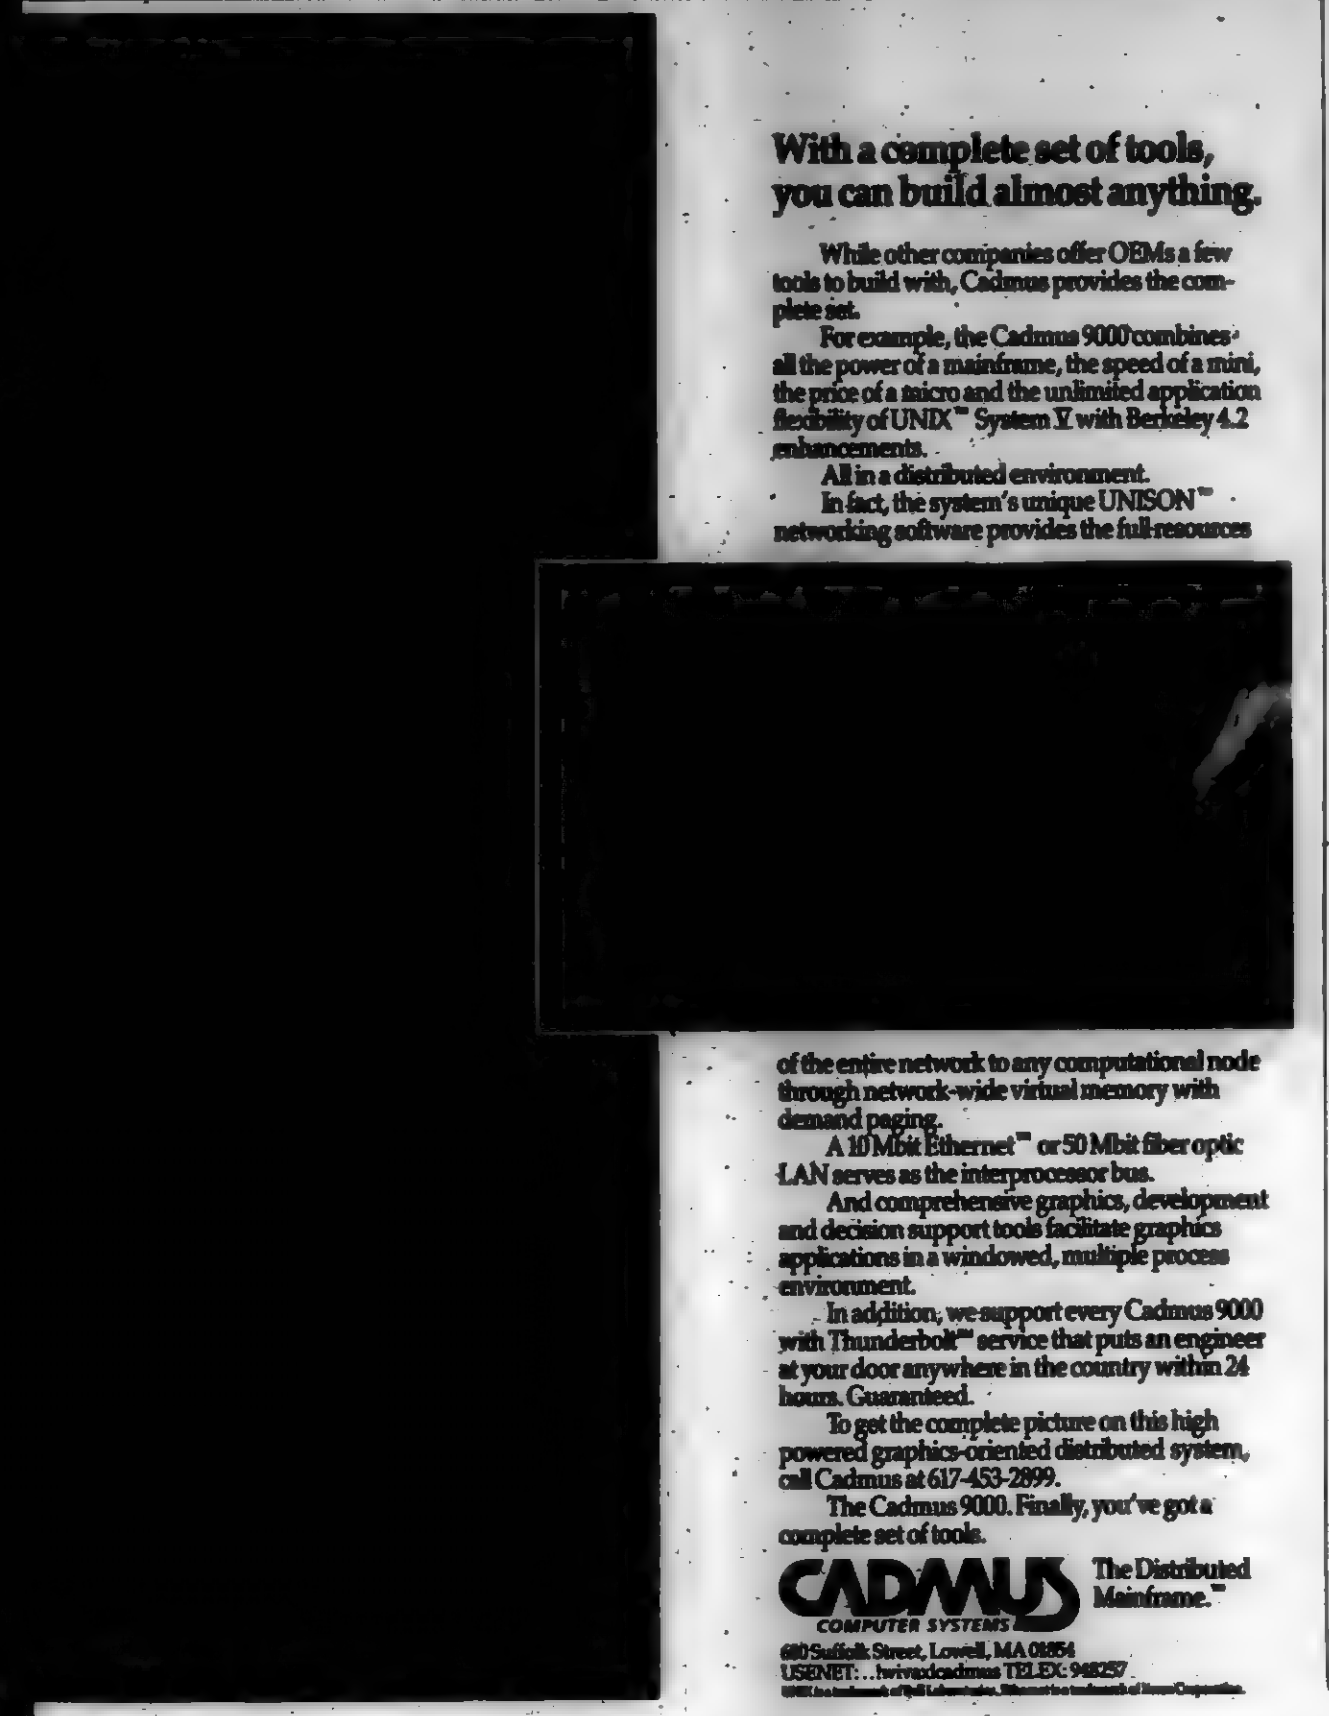
It also administers printing tasks to shared printers, maintains duplicate directories and provides utilities to recover files that are accidentally erased.

Netware/O supports IBM PC-DOS 1.1, PC-DOS 2.0 and Digital Research, Inc. CP/M 86 operating systems, all of which can be used on one network without partitioning the shared disk, according to Novell.

Each microcomputer workstation requires a minimum of 64K bytes of memory.

Netware/O costs $1,495.

Novell, 1170 N. Industrial Park Drive, Orem, Utah 84057.



With a complete set of tools, you can build almost anything.

While other companies offer OEMs a few tools to build with, Cadmus provides the complete set.

For example, the Cadmus 9000 combines all the power of a mainframe, the speed of a mini, the price of a micro and the unlimited application flexibility of UNIX™ System V with Berkeley 4.2 enhancements.

All in a distributed environment.

In fact, the system's unique UNISON™ networking software provides the full resources of the entire network to any computational node through network-wide virtual memory with demand paging.

A 10 Mbit Ethernet™ or 50 Mbit fiber optic LAN serves as the interprocessor bus.

And comprehensive graphics, development and decision support tools facilitate graphics applications in a windowed, multiple process environment.

In addition, we support every Cadmus 9000 with Thunderbolt™ service that puts an engineer at your door anywhere in the country within 24 hours. Guaranteed.

To get the complete picture on this high powered graphics-oriented distributed system, call Cadmus at 617-453-2899.

The Cadmus 9000. Finally, you've got a complete set of tools.

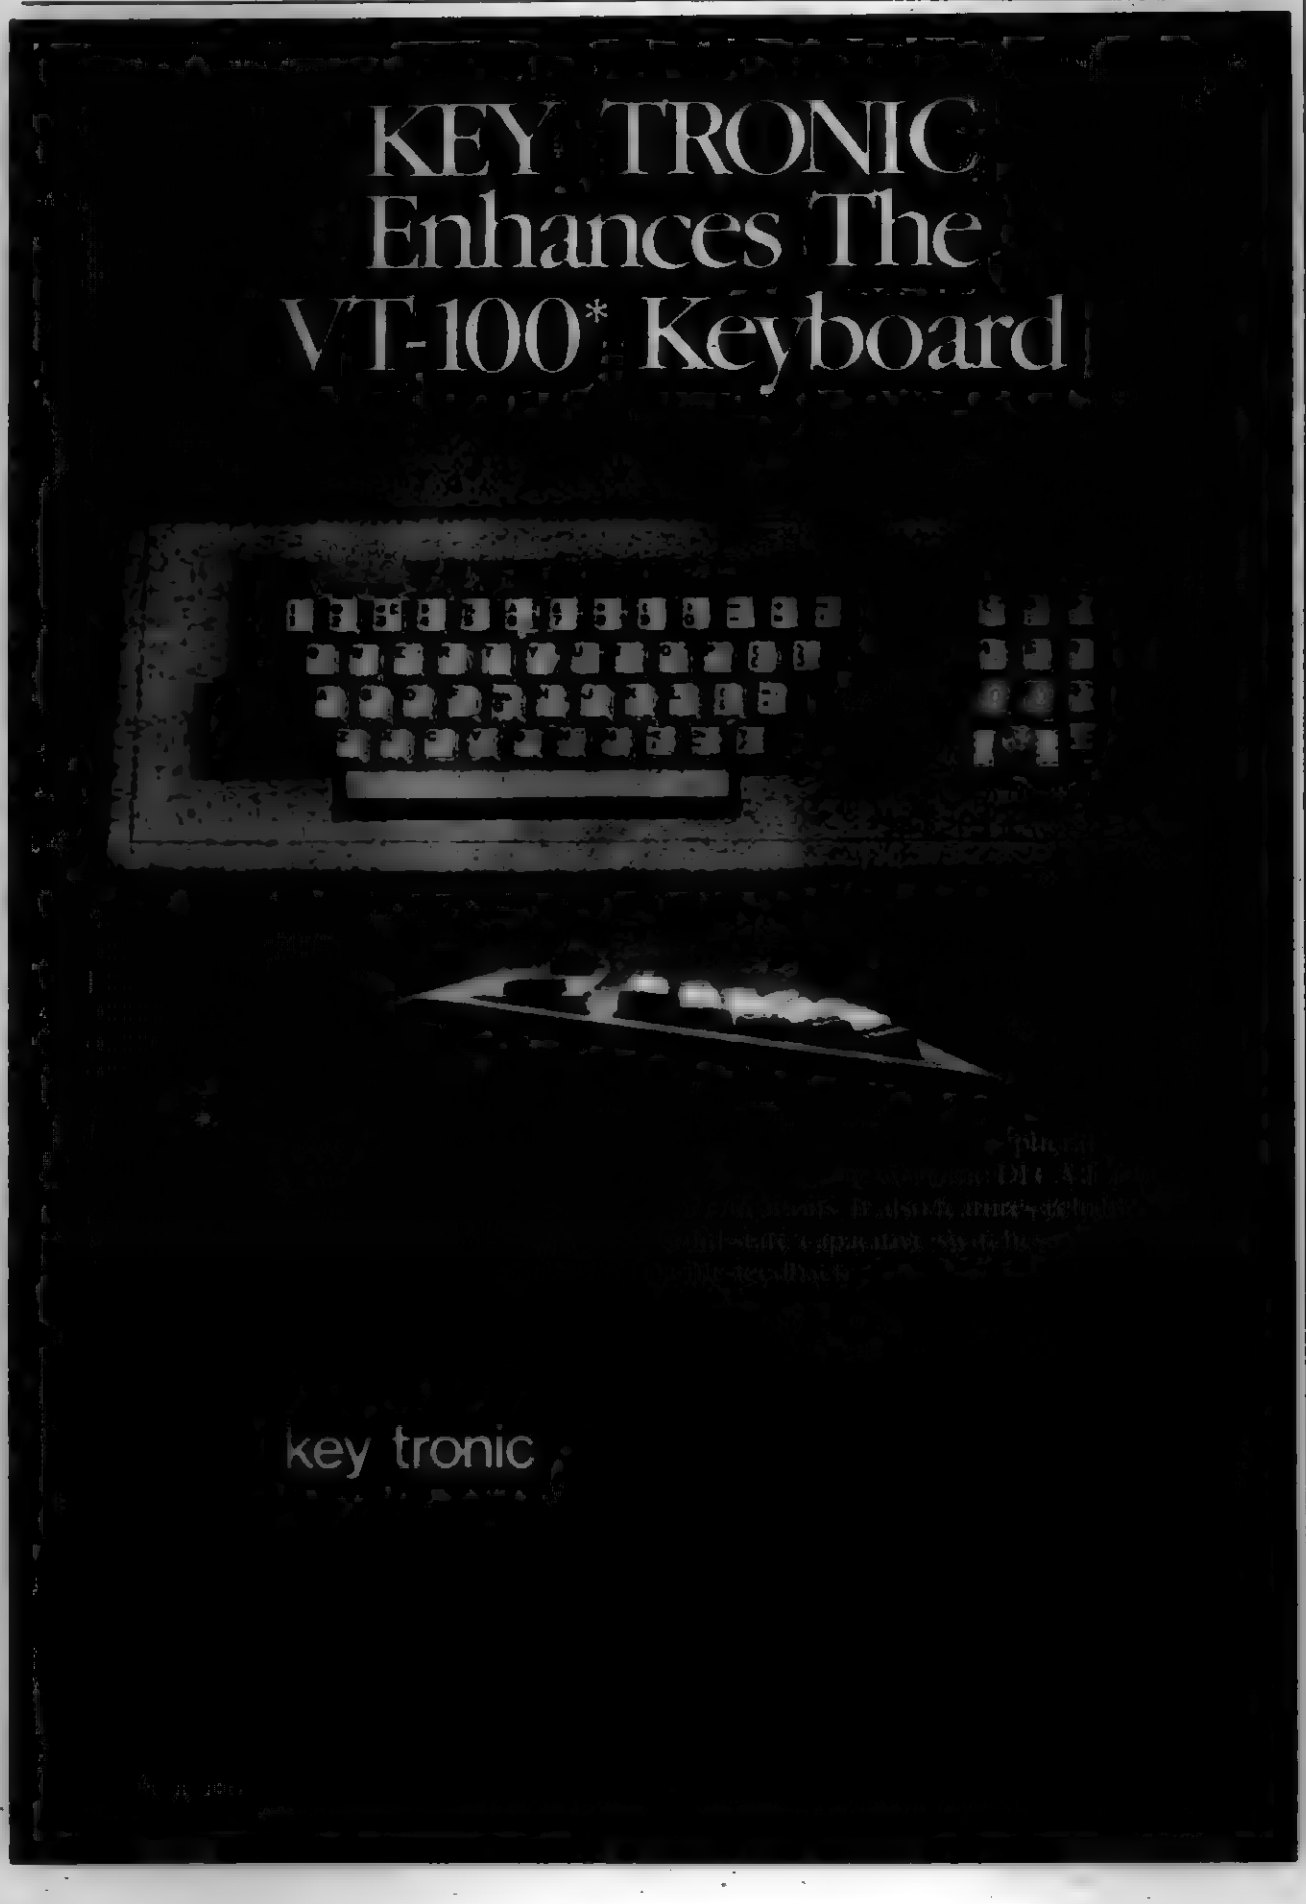
APPLE from page 73

Microsoft's contribution to Macintosh's lineup of third-party software includes its Multiplan spreadsheet package, Basic programming language, Word text processing program, Chart and File. Formally introduced at Apple's Jan. 24 shareholders' meeting, all five products have long been available with IBM's Personal Computers and have recently been modified to support all the features of Macintosh's user interface, according to a Microsoft source.

Multiplan costs $195 and like Basic, which sells for $150, is available now. Word and File also retail for $195 each but will remain unavailable until the second quarter. Sales of Chart, priced at $125, will begin in March from Microsoft at 10700 Northup Way, Bellevue, Wash. 98004.

Like its IBM-compatible predecessors, the Macintosh version of Software Publishing's PFS program line embraces PFS:File and PFS:Report. File aids information management through its filing, sorting and searching features, while Report summarizes information and performs necessary calculations. Both products retail for approximately $100 and will become available during the second quarter from Software Publishing, which is located at 1901 Landings Drive, Mountain View, Calif. 94043.

Also intended to operate with Apple's entry-level, 32-bit micro is Creative Solutions' Mac-Forth, a software development system that reportedly combines the best features of the Forth programming language with Macintosh's windowing capability, menus, mouse support and file structure. A Mac-Forth license sells for $250 from Creative Solutions, located at 4801 Randolph Road, Rockville, Md. 20852.



Third-party tools target Macintosh

Third-party software packages from smaller vendors will also soon be available with the Macintosh. These include:

■ Naru Enterprises, Inc.'s Fact Finder, which reportedly boosts information storage and retrieval productivity. It costs $100 and will become available during the second quarter from Naru Enterprises at P.O. Box 206, Deer Harbor, Wash. 98243.

■ A recent adaptation of Desktop Software Corp.'s NPL Information Management System, a fourth-generation language that purportedly allows computing novices to develop data base management applications. The NPL Information Management System is projected to cost $950 and to be released in April from Desktop at 228 Alexander St., Princeton, N.J. 08540.

■ Four standard accounting programs from BPI Systems, Inc. The packages will sell for $395 each and will start finding their way into customers' hands this spring from BPI at 3423 Guadalupe, Austin, Texas 78705.

■ Haba Systems, Inc.'s Habadex product, which is said to maintain appointment calendars electronically and simplify both telephone dialing and record keeping. Habadex will cost $195 and is to be available April 1 from Haba Systems at 15154 Stagg St., Van Nuys, Calif. 91405.

■ Think Tank, an outline-processing aid slated to cost less than $2,000 and to be released during the second quarter from Living Videotext, Inc. at Suite 232, 1000 Elwell Court, Palo Alto, Calif. 94303.

■ CRT Plus, a decision support tool that Aurora Systems, Inc. will be selling to financial institutions for an estimated $995, plus a $150 annual maintenance fee, from 2423 American Lane in Madison, Wis. 53704.

■ Human Edge Software Corp.'s series of three business strategy application programs, consisting of Sales Edge, Management Edge and Negotiation Edge, each of which sells for $295. Unlike Sales Edge, which will begin to be sold during the second quarter, the other two programs will become available in the latter half of 1984 from its developer, Haba, at 2445 Faber Place, Palo Alto, Calif. 94303.

COMPUTER INDUSTRY

Whither STC after mainframes?

INDUSTRY INSIGHT

BILL LABERIS
CW Senior Editor

Storage Technology Corp.'s (STC) recent announcement that it has scrapped its mainframe development efforts was certainly a surprise, especially to anyone who has spoken lately with Jesse Aweida, chairman and founder.

Interviewed by *Computerworld* in mid-December, Aweida boasted that STC's mainframe would compete against the offerings of IBM with success similar to what STC experienced selling its 3350-look-alike disk drives a couple of years ago.

Now it appears that STC's mainframe efforts have been torpedoed by a number of adversities, not the least of which was the perceived inability to compete against IBM's strongest suit — mainframes.

Chip failures

The official word was that very large-scale integration chip failures caused delays that "reduced the likelihood of successfully marketing the mainframe computer." The question is, what growth path will STC choose now? And what can the company do to restore some of the credibility it lost with this — the second announcement of a major project gone sour — in the last 18 months? The company in August 1982 abandoned plans to market its Virtual Storage System, a complex back-end storage system, one year after announcing the product with great fanfare.

Right now, the mainframe disk drive market belongs to IBM, which shipped an amazing 43,000 spindles for its 3380 thin film head version in 1983, while compatible vendors like Memorex Corp. and STC watched their 3380-like machines trickle out of the loading docks. The bad news for the compatibles here is that IBM will likely announce a quad-density version of the 3380 this year, a machine capable

See STC page 88

Wang eyes overseas market
Seen key to future growth

By Peter Bartoli
CW Staff

PALM SPRINGS, Calif. — "Five out of every six office workers get up, put on their clothes and go to an office that is outside of the U.S."

Additionally, 78% of the gross worldwide product is outside of the U.S.

For that reason, according to J. Carl Masi Jr., senior vice-president of international operations at Wang Laboratories, Inc., U.S. computer vendors are particularly anxious to tap the international sales market.

In a recent interview here, Masi claimed that Wang's international market is growing at a rate three times faster than its nearest competitor. But the percentage of revenues Wang realizes from foreign sales is still too low in comparison to that of other companies, he added.

Wang realizes about 35% of its total revenues from foreign sales, according to Masi, while IBM realizes about 45%. At the same conference Masi was attending here, a Prime Computer, Inc. executive said his company realized half of its total revenues from foreign sales.

When Wang reached $1 billion in revenues in 1982, the company set a new goal of reaching $5 billion by 1990, but is growing faster than that, according to Masi. "If the target is $5 billion, I'd like [international sales] to be half of that," he said.

Because of the potential user base outside the U.S., Masi added, "we're under potential. It stands to reason we should be doing more."

Wang makes direct sales through 20 different subsidiaries and sells into a total of about 100 international markets, he said. Outside the U.S., approximately 7,000 people are employed by Wang, about half of them service related; about 4,000 others are involved in exclusive sales of Wang products, according to Masi.

Wang in recent years has become more involved in foreign investment, he said. At first, the company established manufacturing facilities in "tax havens" of Puerto Rico and Ireland. More recently, it has invested in foreign countries for other than tax reasons, such as for having manufacturing facilities near the markets.

Masi

U.S. companies desiring to sell successfully in foreign countries, particularly to the large public sector, must be willing to meet those countries' demands for investment. "They want to see employment and export, and they want to see technology transfer and value added," he said.

> *'If the country has demonstrated an instable economy or political structure and there's a high chance of nationalization, you're more likely not to put in an expensive manufacturing plant.'* — J. Carl Masi Jr., senior vice-president of international operations, Wang Laboratories, Inc.

In every country where Wang has established manufacturing facilities, he added, 50% or more of its supplies come from the local economy.

"By 1990, every major subsidiary we have will have its own manufacturing facility. Eighty percent to 90% of international requirements will be developed [outside the U.S.]," he said.

Such investments require a degree of caution, he said. "If the country has demonstrated an unstable economy or political structure and there's a high chance of nationalization, you're more likely not to put in an expensive manufacturing plant," he said. "You're more likely to put in a [research and development] facility."

The bottom line, he added, is what the company expects to get out of the commitment. Balancing company expectations against the internal factors of a particular country is something he does "by feel and by gut and by talking to people." Wang has no group of international policy advisors, he said.

AT&T's profits plunge

NEW YORK — AT&T reported that fourth-quarter profits declined 68% over year-earlier figures as a result of $1 billion in reorganization costs and that a previously announced multibillion after-tax charge reduced profits for the year to a low $249 million, or 13 cents per share, compared to the previous year's earnings of $7.28 billion, or $3.40 per share.

Charles L. Brown, chairman of AT&T, said the last financial report of a consolidated Bell system would confuse investors because of the special charges. "I therefore want to stress that, in the main, they reflect one-time, one-of-a-kind events which are a consequence of the breakup of the Bell system," he said.

Taken at face value, $1.4 billion in reorganizational and other costs and $5.5 billion in after-tax charges produced a fourth-quarter loss of $4.87 billion, reportedly the largest loss ever posted by a U.S. corporation. Revenues for the fourth quarter increased over the year-earlier quarter 5.4% to $17.6 billion and for the year increased 6.6% to $65.1 billion.

Income for the quarter was $623.2 million, or 62 cents per share, and reflected one-time costs resulting from an estimated $1 billion in reorganizational costs, costs associated with last summer's strike against AT&T and $176 million paid over to Litton Industries, Inc. as the result of an antitrust judgment.

The charge-off of $5.5 billion resulted from equipment write-offs and accounting changes and was higher than the $5.2 billion that AT&T had predicted last October, reportedly because final figures showed less equipment on hand and less value.

TI down $145 million in '83

DALLAS — Losses in the home computer market and a final exit from consumer computer sales cost Texas Instruments, Inc. approximately $660 million during fiscal year 1983, the company reported Jan. 27. Even with an extraordinary tax benefit of $193 million, TI's operations overall produced a net loss of $145.4 million, or $6.09 per share.

After pulling out of the home computer business late last year [CW, Nov. 7] the company realized fourth-quarter profits of $77.5 million, or $3.23 per share, up 82% from year-earlier results. The fourth-quarter profits included "better than expected sales" of the TI 99/4A home computer, with bargain-basement prices that leveled off under $49 per unit and reductions in software prices resulting in sales producing an $11 million profit from previously written-off inventories.

Overall, the company experienced a 6% increase in net sales to $4.5 billion for the year. Excluding the consumer computer products, the company's operations produced a net sales increase of 10% and profit increase of 73%, company President J. Fred Bucy and Chairman Mark Shepherd noted.

The home computer bail-out and cash needs of other operations pulled TI's cash reserves and short-term investments down from the $420 million reported one year ago to $185 million at the end of 1983. Nevertheless, the two executives said, "We believe our current cash position and available financing sources will support TI's future growth."

The company reported accelerated capital expenditures during the

Wanted: factory automation stories

There's an automation revolution happening on the factory floor, and computerised manufacturing systems are leading the charge.

Computerworld's March Special Report will take an in-depth look at computerised manufacturing systems and how they are altering production, planning, operations and those delicate relationships between traditional DP departments and factory automation specialists.

The report will focus on computer-aided manufacturing and engineering, materials requirements planning, robotics, inventory and shop-floor control.

More importantly, the report will look at the impact of these technologies on traditional manufacturing operations.

If you would like to contribute a tutorial or application story to the report, send your three- to six-page, typed, double-spaced manuscript to Bill Laberis or Pete Bartolik, *Computerworld*, 375 Cochituate Road, Box 880, Framingham, Mass. 01701.

The deadline for all submissions is Feb. 10. Accepted articles sent with accompanying charts, black-and-white photographs or other camera-ready graphics will receive top priority.

HIGH PERFORMANCE

NOW AVAILABLE IN A THREE-SPEED

INTRODUCING THE NEW DS 220 MULTI-MODE MATRIX PRINTER

First there was the Datasouth DS180. The original high-performance printer. The printer that raised the standards of on-the-job performance to new heights. A tough act to follow.

And now, following in the same tradition, is the new Datasouth DS220. State-of-the-art performance, taken to higher levels. In a new 3-speed multimode form. Ready to run data, near letter quality and graphics output—in a single printer.

At data speed, the Datasouth DS220 leaves competitors in the dust. By using high speed tabbing to zip over blank spaces and true logic seeking to print the next available character, the Datasouth DS220 charges through printed copy at speeds rivaling more expensive line printers.

At 40 CPS NLQ speed, the Datasouth DS220 creates near letter quality output with the kind of class that might make you wonder if it was produced by a daisy wheel printer. With its fine tuned 18 x 48 dot matrix, multiple fonts are produced with the precise clarity required for word processing applications.

And for graphics, the Datasouth DS220 adds high performance style to popular microcomputer applications programs through high resolution dot addressable output. Sharp new details emerge from business charts and graphs, and engineering drawings.

And those are just its printing capabilities. Its fully instrumented dashboard allows push button programming of up to fifty features for forms control, communications and print style selection.

Best of all, the Datasouth DS220 costs much less than you might expect for a high performance three speed. Go to your nearest showroom and run a Datasouth DS220 through the gears. See how little it costs to own three high performance printers in one high performance package.

WANG from page 87

"You have to be close to it. . . . I travel about 50% to 60% of the time, and I talk to political leaders as well as other people," Masi said.

But daily operations require dependence on others, Masi continued. "Unless there are emergencies, it makes sense to have local managers running the country."

In international markets, Wang is in the top three or four computer vendors in most areas, No. 2 in some and No. 1 in others that are less mainframe-oriented, he said. "Around the world, the No. 1 competitor is IBM. Then after that it's Digital Equipment Corp. — it used to be Hewlett-Packard [Co.]," according to Masi.

TI from page 87

fourth quarter, reaching a 40% increase and a total of $478 million for the year, representing major expenditures for new semiconductor processing capacity and government electronics facilities.

Semiconductor orders and shipments grew strongly throughout the year and reached record levels during the fourth quarter, TI said.

Additionally, the company said, the TI Professional Computer experienced a positive quarter-to-quarter trend during the year, and the demand for TI's Business Systems picked up in the second half of the year.

STC from page 87

of twice the 3380 storage at less than twice the 3380 price. Having long ago recovered its 3380 research and development monies, IBM will continue to dominate this market, leaving little on the table for its competitors.

STC's tape drive sales will remain healthy, but again IBM may announce an 18-track successor to its 3420, whose priced was chopped a few months back. While an IBM announcement may actually benefit STC, rumored to have its new tape drive waiting in the wings, the question is how much.

How about STC's optical storage subsystem? Until someone comes out with a functional erasable model, optical storage will remain a pipe dream, at least for the massive installed IBM mainframe customer base.

Nonetheless, STC is well poised in the optical disk market, should it ever develop.

So where will the company look to grow from here? Good question, and one which Aweida should look to answer fairly soon. STC cannot live off IBM's 3350 mistakes forever.

Since you'll be spending millions of dollars per month on data communications networks, you want all the information you can get. Right?

Here's how to get it.

Just wait for your February 27th issue of **Computerworld.** Then read the special report on Data Communications Networks from cover to cover. You'll get it all:

- *Local area networks*
- *public packet-switched networks*
- *private branch exchange (PBX) networks*
- *teleconferencing networks*
- *satellite networks*
- *CATV networks*
- *videotext and facsimile networks*
- *voice/data network integration*

You'll get tutorials — bylined opinion/analysis pieces by experts in the field on the use of networks and the future of the networking industry. You'll get case studies of how companies have used specific networks to solve specific business communications problems. And you'll get information on lots more — with articles on everything from microwave links to how AT&T's divestiture will affect voice/data networks.

If you spend — or are planning to spend — millions on data communications networks, then you can't afford to miss the February 27th special report on Data Communications Networks in **Computerworld.**

TI, Motorola pace merchant semi world: ICE

By Robert Stahl
CW West Coast Bureau

SCOTTSDALE, Ariz. — Texas Instruments, Inc. and Motorola, Inc. remain the top two merchant semiconductor manufacturers worldwide, with Advanced Micro Devices, Inc. (AMD) and Toshiba Ltd. making major gains, according to a recently released report by Integrated Circuit Engineering Corp. (ICE).

The ICE report, "Status 1984 — A Report on the Integrated Circuit Industry," said TI remains the top merchant integrated circuit supplier, with sales estimated at $1.45 billion, out of total semiconductor revenues of $1.55 billion.

Motorola's semiconductor revenues also reached $1.55 billion, with sales of integrated circuits topping the billion-dollar mark for the first time, totaling $1.04 billion. These figures, the market research firm added, reflect increases of almost 30% for both companies during 1983.

Merchant semiconductor sales refer to chips made by manufacturers that are sold to system houses, as opposed to chips used for internal consumption. In terms of pure volume, IBM is the world's leading semiconductor manufacturer, but it consumes virtually all of the semiconductors that it produces.

According to ICE, Motorola remains the top merchant supplier of discrete semiconductors, those individual transistors capable of performing only one function, with 1983 shipments estimated at $510 million, an increase of 21% over the previous year.

TI, on the other hand, continues its exodus from the discrete market, with sales in that area down by almost 40% from 1982 levels of around $160 million, the report added.

Among the second tier of integrated circuit manufacturers, ICE claimed, AMD has climbed to No. 9 in the industry, passing both Fairchild Camera and Instrument Corp. and N.V. Philips, the Dutch manufacturer, for that spot.

Japanese suppliers also continue to show vigor, with Toshiba Ltd. passing National Semiconductor Corp. for the No. 5 position.

NEC Information Systems, Inc. remains the leading Japanese integrated circuit producer, ranking third in the top 10.

"The top two American producers managed to stave off the challenge from NEC for the No. 2 spot largely because the U.S. economic recovery led that of Japan, and the unprecedented demand for bipolar devices favored the American suppliers," said William Strauss, ICE vice-president. Strauss explainedthat bipolar devices constitute a smaller share of integrated circuit production in Japan than they do in the U.S.

Worldwide production

Worldwide semiconductor production for 1983 is estimated by ICE at $21.4 billion, (including nonmerchant, or captive, suppliers such as IBM and Hewlett-Packard Co.), a 20% rise over 1982.

Integrated circuits accounted for $16.6 billion of that figure, Strauss said, with U.S. merchant integrated circuit production pegged at $7.8 billion, a 26% increase over the previous year.

Basing its calculations on a poll of major manufacturers, ICE estimated a 29% jump in merchant integrated circuit production for 1984.

Although U.S. integrated circuit plant capacity increased 15% during 1983, ICE claimed utilization rose only 3.5%, thereby contributing to increased backlogs and delivery lead times.

According to the report, some moderate relief is in sight, with capacity forecast to increase 12% in 1984 and plant utilization expected to rise 8.3%.

The report estimates Japanese integrated circuit production during 1983 at $4 billion, a 31% jump over 1982, and ICE forecasts only slightly less growth this year, with shipments predicted to be up by 28%. Japanese semiconductor capital spending, the report added, continues to grow at a rate over twice that of the U.S., up 47% in 1983, vs. 20% for U.S. companies.

Europe behind

European integrated circuit production, the report continued, has lagged behind that of the U.S. and Japan, with 1983 sales of $965 million, up 16% over 1982.

However, the report foresees a 22% increase this year. "For the first time, European [integrated circuit] production has passed discrete semiconductor production," Strauss noted.

Among the nonmerchant semiconductor houses, IBM continues to lead the pack, with an estimated 1983 production value of $2.4 billion. Western Electric Corp. was a distant second, with a production value of $390 million.

The 152-page report is priced at $195.

Ics, 15022 N. 75th St., Scottsdale, Ariz. 85260.

IS YOUR COMMUNICATIONS NETWORK BREAKING UP?

Don't miss
"MANAGING THE COMMUNICATIONS NETWORK."
Exclusively from
Computerworld Reports.

How many vendors, how many different technologies does it take to make your network work? How many end users, how many decision makers *can* it take before something—or someone—cracks up? And does the telephone company break-up mean telecommunications tie-ups?

These are some of the critical questions posed by host John Gantz in "Managing the Communications Network," third in a lively, provocative series presented on 30-minute videocassettes and produced by DELTAK and CW Communications.

This month, you'll get the views of an industry expert, an MIS director, and a leading communications consultant. And be sure to stay tuned, because next month's Report will address another vital concern: the AT&T divestiture and its impact on information management. Watch for future Reports on subjects such as application development centers, artificial intelligence, end user training, the maturing information center, and more.

To learn all the signs of network break-up before your organization cracks up, order Computerworld Reports: "Managing the Communications Network." Call DELTAK order entry at (312) 369-3000; (416) 678-9222 in Canada.

Introducing MARK V™ for CICS users: a *unique*, 4th generation non-procedural application development system that saves you time and money at every stage of your application life cycle. See it at a free seminar near you!

Informatics just broke the productivity barrier with MARK V, an extraordinary timesaving application development system. But, MARK V is not for everyone. *It may be for you if:*

- ☑ You need help in reducing your backlog of medium to complex CICS applications.
- ☑ You use CICS with IBM-supported data access such as VSAM or DL/I.
- ☑ Your CICS system demands highly efficient application execution.

Then, MARK V can help you produce efficient compiled applications that rival the execution of well-written COBOL—in less than half the development time!

Easy application development and maintenance is just the beginning!

MARK V improves productivity throughout the application development and maintenance cycle—not just in the coding—by providing:

- Interactive application design and simulation
- Easy to use, menu-driven specification language for development and maintenance
- Transparent and complete data access/communications control
- Automatically produced application documentation

That means, with MARK V your programmer need only specify the solution. MARK V generates the *complete* application. This methodology allows you to solve more complex problems more efficiently using less highly trained personnel—*and that saves you money!*

Reserve your place at a *free Seminar* on MARK V—the simple new way to develop and maintain your medium to complex CICS applications.

As a data processing professional, you're also a professional skeptic. But the simplicity, versatility and timesaving capabilities of MARK V are easy to see—and prove. To do so, simply mail the coupon below or call toll free. We'll reserve your place at a free MARK V Seminar in a city near you. But attendance is limited. So mail this coupon or call *today*.

COMPUTER INDUSTRY

NICKELS & DIMES

Lee Data Corp. has announced third-quarter revenues of $26.4 million, a 70% increase over the same period last year. Net income for the quarter was $4.6 million, up from $3.3 million a year ago. Revenues for the first nine months were $67.6 million and earnings were $12.3 million, up 88% and 69%, respectively.

■

Bolt, Beranek & Newman, Inc. has reported net income for the second quarter ended Dec. 31 of $1.3 million, or 17 cents per share, compared with $757,000, or 11 cents per share, for the second quarter of 1983. Sales were $25.2 million, up 21% over the same period last year.

■

NBI, Inc. has reported a 24% increase in revenues, but a 13% decrease in earnings, for the second quarter ended Dec. 31. Revenues were $44.7 million, compared with $36.1 million for last year, while income was $3.3 million, or 33 cents per share, compared with $3.8 million, or 38 cents per share last year.

■

Harris Corp. has reported sales of $472 million and net income of $18.6 million, or 46 cents per share, for its second quarter ended Dec. 30, compared with sales of $434 million and a profit of $15.6 million, or 40 cents per share, for the comparable period in 1982.

■

Gould, Inc. has reported net earnings for fourth-quarter 1983 of $25.2 million, or 56 cents per share, compared with $20.3 million, or 46 cents per share, for the same period last year. Sales for the period totaled $342.3 million, a 10% increase over fourth-quarter 1982. Net earnings for the year declined slightly from $79.9 million in 1982 to $79.2 million in 1983. Discontinued operations produced a loss of $15.1 million, or 33 cents per share, against the $12.9 million, or 30 cents per share, earned in 1982.

■

Ungermann-Bass, Inc. has reported revenues for the year ended Dec. 31 of $25.4 million, up 125% from 1982. Net income was $1.9 million, or 14 cents per share, compared with $308,000, or 2 cents per share, in the prior year.

■

Micom Systems, Inc. has reported sales for the third quarter ended Dec. 31 of $34.3 million, up 62% over the same period last year. Earnings increased 63% to $5.5 million, or 35 cents per share.

■

Computer Consoles, Inc. has reported a 31% increase in revenues and a 40% increase in net income for fiscal 1983. Revenues hit $103.6 million, and net income rose to $10.4 million, or 87 cents per share, compared with $7.4 million, or 66 cents per share, for 1982.

■

Stratus Computer, Inc. reported annual sales in 1983 of $20.6 million, compared with $5.5 million the previous year, while profit for the period jumped to $2.2 million, or 13 cents per share, from 1982's net loss of $1.2 million, or 30 cents per share. Sales in the fourth and final quarter totaled $6.7 million, with earnings of $1 million.

SUPERSHORTS

Grumman Data Systems has created a new division, Systems Maintenance Services, to expand its computer maintenance and service facilities in New York. Alan R. Andrus has been named president of the division.

■

Digital Equipment Corp. has unveiled a program designed to assist universities integrate personal computers into nontraditional disciplines. With $16 million worth of DEC hardware, Partners for the Advancement of Computers in Education will aim to foster development of instructional methods and software while increasing student and faculty productivity, DEC said. Fifteen universities have been selected to participate.

■

Honeywell Information Systems and Textronix, Inc. have signed a cooperative marketing agreement under which Textronix will receive assistance from Honeywell in marketing its computer display terminals, copiers and plotters to Honeywell customers in the U.S. Textronix will be responsible for marketing and maintaining the products, which will support Honeywell's entire computer line.

■

General Electric Information Services Co. has become an IBM value-added dealer for the IBM Personal Computer.

■

Xerox Corp. and Advanced Computer Communications (ACC) will both market ACC communications software products, which enable Xerox systems products to operate compatibly with Digital Equipment Corp.'s VAX and PDP-11-based systems which use the VMS, RSX-11 and Unix operating systems.

■

AT&T Information Systems has signed a contract with American Express Co. to design, build, install and maintain an integrated voice and data information system which will serve American Express' new headquarters in New York. The value of the agreement during the first five years is in excess of $20 million.

■

National Semiconductor Corp.'s subsidiary National Advanced Systems (NAS) will provide hardware maintenance nationwide to Magnuson M80 series customers of Phoenix Leasing, Inc., a wholly owned subsidiary of Phoenix American. Under the agreement, Phoenix Leasing will provide logistical support and Magnuson parts to NAS. NAS will offer Phoenix customers the option of contracting for the NAS total support package, which includes a complete range of services for the IBM or IBM-compatible data processing center.

■

Perkin-Elmer Corp. has formed a third-party ventures group under the direction of Richard E. Dural within its Data Systems Group. According to Dural, "The charter of the newly formed organization is to complement the Perkin-Elmer supermini computer and desktop workstation line with products supplied by software houses and independent hardware manufacturers for the commercial and scientific markets."

MOST POWERFUL,

Wang buys 15% of VLSI

LOWELL, Mass. — Wang Laboratories, Inc. recently announced the purchase of 15% or 2.8 million shares of VLSI Technology, Inc. for $34 million.

The two companies recently signed a technical support and cooperation agreement whereby VLSI will provide Wang with access both to its software design technology and to its integrated circuit wafer-processing capacity.

Based in San Jose, Calif., VLSI develops and markets a series of software products and services for the design of custom and semicustom very large-scale integrated circuits and also designs, manufactures and markets custom and semicustom integrated circuits.

DOD push of Ada spawns business bonanza

OUTSIDE LINES

BOHDAN O. SZUPROWICZ

In the early 1970s, the Department of Defense (DOD) began to develop a uniform, all-purpose computer programming language in an attempt to simplify the use of a variety of computing hardware and to control its skyrocketing software costs, currently running over $10 billion a year.

The result is one of the most advanced computer programming languages, Ada, on whose development DOD has already spent about $20 million. Initial Ada compilers and software development tools are now being validated by DOD, and 1984 will probably see the emergence of a new industry dedicated to the development of Ada applications software.

Proponents of Ada see it as an advancement in the art of programming, because the new language allows use of application programs on any computer model, making programmers independent of computer hardware. Ada language is supported by IBM and Intel Corp., which gives it a lot of credibility.

On the other hand, because it is so comprehensive, it is not among the most user-friendly computer languages. Its critics believe it will never become widely used by the programming community. But if Ada is to save billions for DOD, the reluctance of present software suppliers who stand to lose lucrative contracts is expected.

Since DOD is the largest software consumer in the world, its preference for Ada is being closely watched by software companies who see a new business bonanza in Pentagon programs such as these. Some even believe that Ada will affect more software professionals during the 1980s than Cobol did in the 1960s and 1970s. Others are rushing to set up specialized shops developing Ada . . . in anticipation of a market takeoff in 1986 which is expected to reach $1 billion well before 1990.

DOD itself expects to save $24 billion by the year 2000 from use of Ada. Through its directives, DOD is also in a position to make Ada mandatory in development of embedded computer systems, whose software is expected to cost $4 billion in 1984 alone.

Latest forecasts suggest that expenditures on embedded computer systems in modern weapons platforms will increase even faster than previously reported and may reach $30 billion by 1990.

Since DOD is the largest software consumer in the world, its preference for Ada is being closely watched by software companies who see a new business bonanza in Pentagon programs such as these. Some even believe that Ada will affect more software professionals during the 1980s than Cobol did in the 1960s and 1970s. Others are rushing to set up specialized shops developing Ada programming tools, workstations and training programs in anticipation of a market takeoff in 1986 which is expected to reach $1 billion well before 1990.

Some forecasts even suggest that commercial use could demand as much as $100 billion worth of Ada software during the 1990s.

About two dozen small companies have already decided to place their bets on the Ada sweepstakes, developing compilers and workstations for use by the Ada programmers of tomorrow. Some are indistinguishable from run-of-the-mill software startups, but a few appear to be catching the eye of the venture capitalists and investment bankers who understand what is at stake.

Intelligenetics Corp. claims to be the first company to produce commercial Ada applications software and is already planning to raise $14 million through its first public offering, now being readied. The company is a minicomputer systems integrator and needs the capital to produce a microcomputer for Ada multiprocessing applications.

Computer Thought, Inc. is a 1981 start-up that combines the techniques of artificial intelligence with specialized hardware to develop a workstation for learning Ada programming. The company received two rounds of financing from leading venture capital firms. The array of smart money investors it has attracted suggests that the company's thoughts about Ada may be on the right track indeed.

Telesoft, Inc., a 1981 start-up, was among the original Ada compiler developers and has already sold over 350 units to commercial and military customers. The company is developing Ada compilers and microcomputers using the Unix operating system and has an Ada compiler for the IBM Personal Computer.

Intermetrics Corp. and Softech, Inc. are two Ada pioneers that developed compilers for the U.S. Air Force and U.S. Army, respectively. Both have grown in sales to over $20 million each. Softech is hedging its bets by developing operating systems for microcomputers that are portable from one popular machine to another.

But perhaps the most intriguing of new Ada ventures is **Alsys Microsystems Corp.**, a subsidiary of a three-year-old French company headed by Jean Ichbiah, one of the leading Ada designers and an original developer. The U.S. subsidiary is marketing low-cost Ada compilers for microcomputers and has a training system for the IBM Personal Computer. Its ambition is to become the leading Ada micro software supplier.

Martin Marietta division grabs $102 million Labor contract

WASHINGTON, D.C. — The U.S. Department of Labor has awarded Martin Marietta Data Systems, Inc., a division of Martin Marietta Corp., a $102 million contract to design, install and maintain a computerized information system for the department's Division of Federal Employees' Compensation.

The contract, to be spread over eight years, involves designing an application system to handle claims examination, financial management, rehabilitation, medical support, case maintenance, district office support and national office support for the more than 2.8 million federal employees covered by the federal compensation program.

Martin Marietta Data Systems will install IBM 4300 series mainframes to provide automation in the division's national office and in district offices across the country. The company will also train federal employees to operate the system, handle all data conversion from the current system to the new system and maintain the facilities for eight years.

Martin Marietta Data Systems has proceeded along a rapid growth path for several quarters now, exercising the financial muscle of its parent to purchase Mathematica, Inc. for $30 million last August [CW, Aug. 8, 1983]. The company's strategy remains to make applications and system software independent from the hardware, while targeting the low-end mainframe and superminicomputer offerings of IBM, Digital Equipment Corp. and Hewlett-Packard Co.

Output for '84 already spoken for: Intel chief

By David Myers
CW New York Bureau

NEW YORK — With 28 new buildings under construction, Intel Corp. is adding production capacity as quickly as it can and will catch up with its backlog of semiconductor orders "at the next recession," according to company President Andrew S. Grove.

Addressing a meeting of stock analysts here late last month, Grove said Intel's entire 1984 production volume of memory chips and microprocessors is already spoken for. New orders will not be filled before next year, he added.

"We're going to catch up at the next recession. We'll be in a precise balance of supply and demand for about 35 seconds," Grove quipped.

Grove said the semi maker's revenue growth was limited by its ability to catch up with the backlog of orders. Even so, in 1983 the Santa Clara, Calif.-based company earned $116 million, almost quadruple its $30 million profit in 1982.

Grove said Intel officers expected "a pretty good year" in 1984. He declined to be more precise, beyond saying that the company expected to contribute "several tens of millions" to its employee profit-sharing fund, while last year it contributed only around $1 million.

The chip maker's rebound from two years of lagging profits was charged by fast sales of its 8086 microprocessor, which had grabbed a 72.3% share of the 16-bit microcomputer market by year's end, according to Grove.

Pointing to a chart that showed a steep growth curve for the 8086 since its introduction in 1982, Grove said, "If we could meet actual demand for the product, that line would be vertical."

The Silicon Valley firm had introduced the 8086 and added wafer fabrication capacity during the recession in order to be ready for any upturn in the U.S. economy. "But we did not anticipate the strength of this recovery sufficiently," Grove said.

In his first speech in two years before Wall Street analysts, Grove said Intel was attempting to standardize microprocessors for the computer industry "so that we can move forward without requiring further software development." He also said that Intel would be graduating to 6-in. wafer fabrication from 4-in. wafers. Grove said 2,200 chips could be carved out of a 6-in. wafer, as opposed to 400 from a 4-in. slice of silicon.

Grove

"But we won't see the benefits of this for a long time," Grove cautioned, saying he shared it as "an indication of the type of thing we are doing beyond adding brick and mortar" — building new plants, that is.

In addition, Grove revealed that Intel is negotiating second-source licensing pacts with two different semiconductor makers in order to increase the market supply of 8086-type microprocessors. And the company is looking to work out deals to rent still other manufacturers' wafer-fabrication facilities in order to free Intel production room for 8086 manufacture, he said.

Despite a recent push of its single-board computer systems business, Grove vowed that Intel would never become "a systems-dominated company." And despite a clear lead for U.S. semiconductor makers over their Japanese rivals, Grove said, "It is important for us in this industry not to be lulled by this. I can't picture a roomful of Japanese execs saying, 'We lost this one, gentlemen. Let's go back to making motorcycles.'"

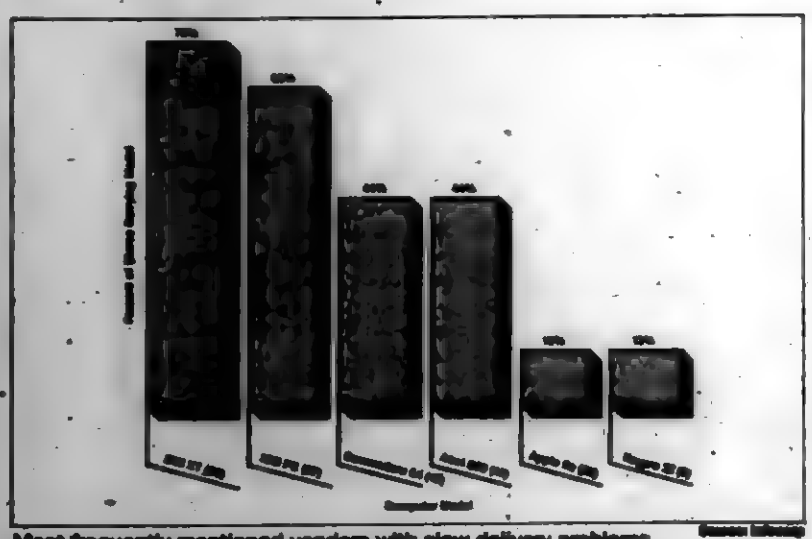
Micro dealers form group

TUSTIN, Calif. — The American Microcomputer Dealers Association (Amda) has been formed in response to a survey that indicated "a void exists in an industry that is rich in hardware technology and software development, but poor in the area of serving computer dealers directly."

Amda said it will provide services in areas of interest to resellers. Members have access to a range of financial and marketing tools through Amda/Net, a subsystem of the GTE Telenet Communications Corp. Mailnet network. Depot and on-site maintenance programs are available also through an Amda service provider.

A group health and business insurance package designed specifically for computer dealers is available to members, as are a full-service credit union and discount travel services.

Amda membership costs $195 per year from Amda at Suite 200, 17842 Irvine Blvd., Tustin, Calif. 92680.



Most frequently mentioned vendors with slow delivery problems.

Apple holds lead; IBM closes micro gap: study

CUPERTINO, Calif. — Apple Computer, Inc. has maintained and even increased its lead in terms of volume share of personal computer sales in retail stores.

But IBM, too, has increased its share of retail sales and has done so at a faster rate than has Apple or any other personal computer competitor.

These were some of the conclusions reached in a recent study of computer store sales for the third quarter of 1983 by Infocorp, which polled 322 retail outlets in its survey.

Infocorp's data established that Apple's share of retail store sales volume of microcomputers rose to 44.6% from 42.4%, despite prior predictions that the company would suffer a devastating loss in share during the third quarter. IBM's share rose to 35% from 30%, giving Apple and IBM nearly three-quarters of the retail store market share for personal computers.

At the same time, other data indicated IBM has surpassed Apple in total share of the personal computer market. Apple relies on the retail store channel almost exclusively to sell its machines, while a significant portion of IBM's micro sales are made by its direct marketing force, Infocorp said.

In addition, the survey discovered that the hottest microcomputer system in the retail chain is IBM's Personal Computer XT, with 72% of the dealers who carried both the Personal Computer XT and Apple's Lisa reporting greater customer interest in the IBM model. "This seems to further attest to the significant inroads IBM has made in the retail store channel," Infocorp noted.

The demand for IBM's micro products, however, has not been matched by adequate deliveries from the company, the survey continued. "The situation remained acute for the [Personal Computer] XT, but was alleviated somewhat . . . for the [Personal Computer]. Apple's IIe delivery improved significantly," the survey found.

Other major survey findings included:

- Microcomputers from Digital Equipment Corp., especially the Professional, and from Osborne Computer Corp. were the most overstocked machines in the dealers' inventories. Further, in a survey category dubbed "Sales vs. Expectations," DEC's machines did "relatively poorly."
- The reliability of Commodore Business Machine, Inc.'s Model 64 worsened in the period surveyed, while poor reliability reports increased "dramatically" for Kaypro, Inc.'s II and 4 models.
- Both Commodore and Osborne were rated "poor" in terms of product support.
- While the Apple IIe was rated as the machine easiest to sell to the home and school markets, IBM dominated the small, medium and large business markets, as well as professional applications.
- Apple and IBM dominated retail store sales to the government sector.

Infocorp, 20395 Pacifica Drive, Cupertino, Calif. 95014.

POSITION ANNOUNCEMENTS

Experienced Computer Sales & Marketing Representatives

Get off the sales rollercoaster with strong sales support, stability...and opportunity.

The HP Way.

If you're tired of the same old promises, consider Hewlett-Packard. We have outstanding opportunities for career-minded professionals with 2 or more years' specialized sales experience in the minicomputer field. With a degree in engineering, physics, math, computer science, business or the equivalent combination of education and experience, you could qualify for consideration.

1. Bellvue, WA
2. Santa Clara, CA
3. N. Hollywood, CA
4. Los Angeles, CA
5. Englewood, CO
6. St. Paul, MN
7. Rolling Meadows, IL
8. Novi, MI
9. Dallas, TX
10. Houston, TX
11. Atlanta, GA
12. Raleigh, NC
13. Orlando, FL
14. Lexington, MA
15. Paramus, NJ
16. Valley Forge, PA
17. Rockville, MD

and other cities across the U.S.

Careers are yours for the making.

HP offers more than a job. You can reach the top of your field right across the nation. But you'll need to be creative, enthusiastic and have the business maturity and technical know-how to interface effectively with end user decision makers.

Two areas of opportunity for Experienced Field Sales Representatives -

Technical Computer Sales

These positions are responsible for selling HP's technical computer products to scientific, technical and manufacturing customers in your assigned territory. Besides degree or equivalent, 2 years' successful CAE/CAD/CAM or manufacturing minicomputer sales experience is desirable.

Commercial/Business Computer Sales

These positions are responsible for selling large-scale minicomputers, primarily to the manufacturing market. As well as managing the existing customer base in your assigned territory. Besides degree or equivalent, 2 years' successful business computer sales experience is desirable.

Invest in your future... long term.

We rank high among major computer companies in terms of sales growth, earnings, product innovations and employee retention. This means career stability... year in and year out. It starts with in-depth training for up to 10 months, covering every aspect of the business... from learning the HP product line to the most sophisticated sales techniques. You'll quickly gain hands-on experience working with senior HP people.

With HP you'll reap the benefit of rapid production, delivery and installation, plus strong pre-and post-sale technical support. Because our credo is "productivity - not promises."

Consider the HP advantages.

Besides excellent compensation and benefits, you'll find your career progression with us a lot smoother than what you've experienced in the past. For immediate consideration, please send your resume with salary history, indicating your preferred city.

JOIN A TEAM ON THE LEADING EDGE OF TECHNOLOGY!

Computer Consoles, Inc. designs, manufactures, markets, and services a variety of minicomputer-based fault-tolerant information systems. Located in Rochester, New York, we have all the cultural and educational advantages of a large metropolitan area as well as the ambience and scenic beauty of a small, relaxed town.

CCI currently has opportunities for:

GROUP LEADER/SOFTWARE ENGINEERS

You will be responsible for the design and implementation of data base applications and utilities or fault-tolerant operation system development, including developments of a multi-processor UNIX*-compatible transaction processing system. We prefer a technical degree plus a minimum of 2 years' experience. Knowledge of "C", UNIX and data structures and experience with data bases in minicomputer Real Time or on-line environment and/or DB internals are pluses.

DATA MANAGEMENT SYSTEMS DESIGNER

You will be a member of a team responsible for designing and developing an interactive transaction data management system. This includes an integrated data dictionary, query editor and advanced files access method. A non-procedural commercial application generator and forms manager provide easy-to-use facilities for end-users. The total system is integrated into PERPOS™, CCI's multi-processor Power 5™ family of systems and office automation products. We prefer a B.S./M.S. in C.S./E.E. plus 4-5 years' experience in system design and development of data management systems. Experience with UNIX and "C" is highly desirable.

SENIOR SYSTEM SPECIALIST

You will be the lead designer and developer of advanced R&D projects that will extend CCI's Power Series of fault-tolerant systems. An advanced degree with extensive experience in UNIX operating system development are required. Additional experience with other operating systems and hardware system design is highly desirable.

*UNIX is a trademark of Bell Labs.

We offer challenging assignments, opportunities for growth, attractive compensation, and a benefits package that includes dental and profit sharing plans. Please send your confidential resume, including salary history and indicating position of interest, to:

THE SCHUMANN CONSULTING GROUP

We are a respected consulting group with approximately 250 employees. For the past 12 years, we have been providing a wide variety of services in the fields of management, organisation and data processing on behalf of important clients at home and abroad. Within the field of EDP, especially concerning system consulting, we belong to the leading companies in Europe. We are now considerably expanding our "System Consulting" section and are therefore looking for several new members of staff.

We require:

System Specialists for interesting and demanding system-related assignments, both German and International, using IBM equipment (Reference: 103).

You should have the following qualifications:

- sound theoretical training with degree or equivalent in mathematics, computer science or engineering
- wide experience in system programming and generation
- practical experience in installation and management of DB/DC systems
- detailed knowledge and several years' experience in one of the following fields:
  - Networks, especially SNA
  - MVS system programming and tuning with emphasis on VTAM
  - VM/CMS system programming and tuning with a DOS/VSE and MVS background
  - DDP, especially 8100
  - Data communications, especially CICS
- good knowledge of English and at least basic German

Successful candidates will not only have the necessary professional experience, but also the ability to apply their particular experience as skilled consultants. They will also need flexibility, willingness to undergo further training at all times, with our support, as well as the drive and ability to work as part of a team.

For the right candidates, we are offering competitive salaries and results-oriented bonuses. Please write to us, quoting the above reference, and enclosing all relevant credentials. For further information by telephone, ask for Mr. Tuechler. Tel.: Cologne 798091(-95).

All applications will be treated with complete confidentiality.

TULANE UNIVERSITY

ASSOCIATE PROVOST FOR COMPUTING

Tulane University has a major commitment to its position as a research and teaching center and is seeking an Associate Provost for Computing to provide leadership to this institutional commitment. Primary responsibilities are planning, control and evaluation of computing needs and services, establishment of and monitoring guidelines for computing services, formation of the budget, oversight of communications between user groups and the Computer Center, facilitation of computing growth and active leadership of the University's effort to stay abreast of and capitalize on advancing information technology.

Tulane computing is presently comprised of two distinct user groups: academic and administrative. The administrative units include Admissions, Registrar, Financial Aid, Student Services, Personnel, Payroll, Development, Financial Accounting, and Institutional Research.

Academic computing responsibilities involve (1) user needs assessment for both faculty and students, (2) expansion of user services, and (3) planning for personal computer networking, software development, and departmental workstations. Users include faculty in all disciplines with regular computing requirements for instructional and operational research and the teaching population.

The individual must have the technical skills which will allow for effective assessment and planning for computing needs of the University community. Managerial effectiveness will be used as an important criterion in candidate selection.

Salary: Negotiable depending on background and experience.

Qualifications: Minimum of a Bachelor's Degree (Master's degree or Ph.D. preferred).
1. Experience in planning and developing computer systems.
2. Experience in developing user-oriented relations between computing staff and the user communities.
3. Technical and administrative experience related to the management of a computer center.
4. Extensive knowledge of Information Systems used for administrative and academic computing.

Application Procedure: Applicants should submit a resume, cover letter, and names, addresses and phone numbers of five references to whom to speak about the applicant's professional abilities. The deadline for applications is March 15, 1984. Send materials to: Francis L. Lawrence, Assistant Vice President and Provost, Tulane University, New Orleans, LA 70118.

Tulane University is an Affirmative Action/Equal Opportunity Employer

---

We need DATA PROCESSING PROFESSIONALS to upgrade our '84/85 systems

(CONSIDER THE POSSIBILITIES)

American Isuzu Motors, an automotive importer/distributor was founded in 1980. Since then we have grown rapidly and are currently seeking experienced data processing professionals in the areas listed below:

LEAD SYSTEM ANALYST

We need an experienced System Analyst with a background in project management. The successful candidate will have a B.A. degree or equivalent and 2 - 4 years previous experience as a lead system analyst. Two years supervisory experience required with business knowledge of automotive industry desirable. Good written and verbal communication skills are necessary. The primary responsibility is to compile business requirements for computer system design which includes operation survey, data base and general system design, and preparation of documents for users and programmers.

SYSTEM PROGRAMMER

We seek an individual who is qualified to design, program and maintain computer software. This position requires a B.A. degree, five years system programmer experience and three years IBM DOS and IBM VTAM experience. Responsibilities include reviewing and analyzing software supplied by the manufacturer and determine optimum configuration required for the installation.

We plan to upgrade our system in '84 and '85 corresponding with the growth of our company. We offer excellent company paid benefits including all-group insurance.

Send resume with salary history to:

American Isuzu Motors Inc.

CHAIRMAN
- COMPUTER AND INFORMATION SCIENCE
FORDHAM UNIVERSITY

Fordham invites applicants with proven achievements in research and teaching to apply for the Chairmanship of the newly established department. This position will carry an 80% load. Salary is negotiable. The new Chairman will be expected to establish a major in Fordham College. Consequently leadership will be required in developing the curriculum, the faculty and ultimately a research program appropriate for computer and information science in a liberal arts environment. Fordham University has consistently attracted an exceptionally talented student body with a wide variety of backgrounds. This should together with its proximity to New York City offer a stimulating atmosphere for combining teaching, research and culture. Send VITA and the names and addresses of at least three references to:

Philip G. Clapwell, Search Committee
Chairman, Computer Services,
Fordham University,
Bronx, New York 10458.

Nominations and applications will be accepted until the position is filled. Fordham University is an Equal Employment Opportunity/Affirmative Action Institution.

SOFTWARE SYSTEMS PROGRAMMERS

The Industrial Technology Institute is an innovative, professional group working with academic, industrial, and government partners who have invested substantially to create a major intellectual center for R & D in the exciting new area of industrial automation. We have an immediate need for the following professionals:

- **Senior UNIX Systems Programmer:** A UNIX systems programmer is needed to work with researchers on the installation and development of computing facilities. Key responsibilities will be to develop, enhance, and maintain systems software, to implement network connections with various installations, and to troubleshoot system problems (hardware and software). The successful candidate must have extensive experience with UNIX system programming and structured design, and knowledge of compiler development concepts.
- **Factory Software Systems Programmer:** This professional will develop software for research projects in the area of Integrated Flexible Manufacturing Systems. Responsibilities include implementation of the Institute's Manufacturing System Control Software package for real-time control of factory environments. Considerable knowledge and maturity in the use of high level programming languages, software engineering techniques and real-time control systems is required. Experience with UNIX and either Ada or the C programming language is desirable.
- **Database Systems Programmer:** The successful candidate will develop a query-oriented user interface for the Institute's Information and Communications Center and will design and implement database-oriented applications, as well as select or help develop a bibliographic information retrieval system. Minimum of 3 years experience in user-oriented support programming role, experience with database management systems (in particular, relational), knowledge of typical database applications (financial, human resources, bibliographic, etc.), proven experience with structured programming techniques and project life cycle management. Must have excellent communication skills. Prior experience with UNIX and compiler development a real plus.

We offer a competitive salary and benefits package, and an excellent opportunity to become part of a dynamic, growing organization. If you are interested in learning more, please send resume in confidence to: J. Bob Noel, Department DSC-cw, Industrial Technology Institute, P.O. Box 1485, Ann Arbor, MI 48106. A non-discriminatory, affirmative action employer.

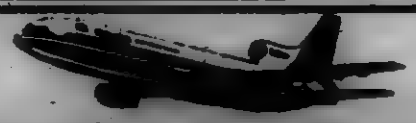
MIAMI UNIVERSITY
SYSTEMS ANALYSIS DEPARTMENT

Applications are invited for faculty positions beginning August 1984. Candidates should have expertise in computer systems (software engineering, analysis, design, database, telecommunications) or in the area of operations research, particularly as applied to the analysis of forecasting, inventory, production and/or computer systems. A Ph.D. or an M.S. with industrial experience is preferred. Duties are teaching, research, and public service. Rank and salary will be commensurate with qualifications.

Send resume to Donald Kellogh, Systems Analysis Department, Miami University, Oxford, Ohio 45056. Miami University is an equal opportunity/affirmative action employer.



COMPUTER PROFESSIONALS

JOIN ONE OF THE WORLD'S FASTEST GROWING AIRLINES (SINGLE OR FAMILY STATUS)

SAUDIA is one of the world's fastest growing international airlines, which now operates over 68 jet transport aircraft to major cities in Asia, the Middle East, Europe and North America. SAUDIA's expansion has created opportunities for key specialist and analyst positions in the Planning and Control section of its Data Services Department at its Jeddah headquarters. The processing power of multiple 3033 IBM mainframes is provided to all major functional areas of the airline, using standard IBM software products (MVS, CICS, IMS DB/DC, TSO) and well-established proprietary packages (Librarian, TOTAL).

We are now looking to appoint the following computer professionals:

SENIOR STANDARDS SPECIALIST
$2801 Per Month Tax Free*

The Standards function is responsible for establishing and maintaining guidelines for all aspects of computer systems development — functional specifications, technical designs, programming specifications, applications programs (COBOL and PL1 source code, CICS routines, and IMS DB/DC techniques), and user documentation. Senior Standards Specialists participate in Quality Review meetings to insure compliance with standards or to authorize specific waivers. SPECTRUM and YOURDAN methodologies are employed. The position requires at least eight years of practical EDP experience in software development, with a minimum of two years involvement with formal standards and structured programming practices for a large-scale IBM installation.

SENIOR INFORMATIONS SYSTEMS PLANNING ANALYST
$2801 Per Month Tax Free*

The Information Systems Planning function is responsible for the development and maintenance of SAUDIA's plans for data processing activities and facilities. A long-range Information Systems Plan (ISP) has already been developed, and the planning function is responsible for maintaining this ISP and determining the resources required to carry out the ISP. This requires the identification of the hardware, software, and staff resources necessary to satisfy the requirements of planned new projects and the maintenance of existing systems. The position requires a bachelor's degree and at least eight years of relevant experience, with a minimum of two years direct involvement in either equipment evaluation, systems software evaluation, or software development planning. Prior experience with DBMS and systems development methodologies desired, and effective writing skills required. An operations research background would also be beneficial.

SENIOR METHODOLOGY SPECIALIST
$2801 Per Month Tax Free*

The Quality Assurance function is responsible for reviewing all areas of Data Services' operations with respect to compliance with applicable policies, standards and procedures. The Senior Methodology Specialist will convene Quality Review meetings at specifically designated points in the development cycle of applications software. Specific attention is directed to project control, utilizing SPECTRUM and Nichols NS800 methodologies. The Senior Methodology Specialist should have a minimum of eight years practical experience in a large-scale commercial IBM environment, and at least two years related quality assurance experience. Prior exposure to system development methodologies and data base management systems required.

SENIOR SOFTWARE TRAINING SPECIALIST
$2801 Per Month Tax Free*

The Skills Development function is responsible for the training of both computer operations and software development staffs. The Senior Software Training Specialist will develop and deliver on-the-job skills enrichment training for applications programmers and systems analysts, primarily in the areas of structured programming, COBOL, and CICS. In addition, there is an on-going testing and programmer trainee evaluation program to administer. At least six years prior experience required, with a knowledge of YOURDAN methodology preferred.

BENEFITS

Free furnished air-conditioned housing and utilities • Paid medical insurance • 30 day vacation with positive space travel for family to and from domicile • Free or reduced rates on SAUDIA and other airlines • Retirement program (social insurance after 15 years service) • Household shipment from domicile to Saudi Arabia and back • K-8 schooling for children — out of Kingdom financial assistance for other grades • Annual service increase and eligibility for yearly merit bonus based on performance.

*The indicated salaries are available to U.S. and Canadian citizens, and have been converted from Saudi Riyals to U.S. dollars at the current rates of exchange, which are subject to fluctuation. Salaries are tax-free, subject to normal qualifications.

Positions are offered on a two-year contract. In your reply, please indicate your position preference. Send resume to:

MEET THE CHALLENGE

Hayes Hayes Hayes Hayes Hayes Hayes Hayes Hayes

. . . with Hayes in Atlanta!

At Hayes Microcomputer Products, we're challenging the future of the telecomputing industry today . . . stretching technology beyond its limits with ongoing research . . . and providing some of the top technical minds in the world with the most advanced tools available — like computer-aided engineering systems and automated assembly and manufacturing, including robotics equipment.

The Challenge is Tomorrow . . . Put Hayes in Your Future!

TECHNICAL SUPPORT ANALYST

Will conduct ongoing research and evaluation of new microcomputers, peripherals, operating systems, development languages, editors, application software, and other products as requested by management. Will prepare reports and development strategies to be used by the marketing department, design analysts, and programmers. Must have a 4 year degree in computer science, electrical engineering or related field. Should have previous experience with at least two different microcomputers, including hardware architecture, operating system, development languages and related peripherals with at least 2 years programming experience on microcomputers. Must have designed and prepared programming specifications for at least one application.

SOFTWARE DEVELOPMENT PROGRAMMERS/ANALYSTS

Responsibilities will include the development of high quality programs using Pascal and other high level languages. Should be experienced with microcomputers including operating systems, local area networks and applications programming. Should be familiar with standard design, test and documentation techniques. BS/MS Computer Science or equivalent and previous microcomputer experience required; training/experience in assembly programming beneficial.

SENIOR DESIGN/ APPLICATIONS ANALYST

Responsibilities will include the design and development of application programs for Burroughs and Personal Computers to be closely tied in a network. Applications to include Data Base, Time Management and Communications, etc. Should be experienced with microcomputers, operating systems, networks and applications. Experience with design methods, Pascal or other high level languages and good communications skills required. BS/MS Computer Science or equivalent and previous programming and design experience on the project leader or senior analyst level required.

Our Norcross location, a convenient suburb of Atlanta, offers a moderate cost of living, a mild-but-seasonal climate and a vast array of year-round cultural and recreational activities. Hayes offers a state-of-the-art working environment that affords career challenge with the fourth fastest growing private company in the nation . . . along with unlimited advancement potential. The compensation package is exceptional and includes a comprehensive profit sharing program.

To receive prompt consideration, please send resume and salary requirements in confidence to:

Programmers.

Systems Programmers

Name the company that is delivering the most powerful and reliable IBM-compatible processor in the world. Then look into National Advanced Systems career opportunities — and be a part of that company.

Systems Engineers

Openings in: NEW ORLEANS, PHOENIX, MONTREAL, TORONTO, SAN FRANCISCO, LOS ANGELES and NEW YORK CITY.

As a SE you will provide technical support for the sales effort which will include assisting the sales staff with technical studies, equipment configurations, presentation of products, software package analysis and capacity planning. You will also be involved with proposal preparation. Requirements include a minimum of eight years' experience with extensive skills in at least one major operating system (MVS, VM, DOS).

Systems Support Representatives

Openings in: LOS ANGELES, SAN FRANCISCO, PHILADELPHIA, NEW YORK/NEW JERSEY, TORONTO and GERMANY (fluency in German required).

As a SSR you will technically support our customers; provide educational support to NAS personnel and orchestrate formal classes for customers. You will also be involved in installation planning and operator training. Requirements are 10 years' DP experience with extensive skills in at least one major IBM operating system (MVS, VM or DOS). We favor skills in and exposure to areas such as: project planning and management; telecommunications; capacity planning and tuning; architecture and hardware; multiple operating systems; and major subsystems (IMS, CICS, VTAM).

Systems Support Representative — Branch Manager

Opening in: LOS ANGELES AREA

As SSR Branch Manager you will be responsible for the supervision of all software service activities in the branch office. Additional involvement will be in planning and scheduling of software support activities and overall supervision. You will set objectives, assign tasks, monitor and evaluate assignments to ensure goals are met. This position will also be responsible for the budget, headcount, equipment and supplies. Requirements include a minimum of eight years with directly applicable software systems experience; a computer science/technical degree is preferred.

If you are looking for an exciting, highly technical career, then look at NAS. We offer excellent salaries and benefits, as well as opportunities for growth and development for our staff.

For immediate consideration, please call, or send your resume to Joy Molnar, National Advanced Systems, 800 East Middlefield Road, Mountain View, CA 94043; (415) 962-6273. We are an equal opportunity, affirmative action employer.

MIS Opportunities In The Sunbelt

H.E.B. is a billion dollar corporation that is one of the fastest growing companies in the country. We present a sophisticated MIS environment; IBM3083, MVS/SP, IMS, TSO/SPF. As a result of continued expansion, we have the following needs:

DATABASE ANALYST

This is the highly visible position that reports directly to the Manager of Systems Support. You will have complete responsibility for database design and analysis. The qualified candidate must possess a Bachelors degree, with at least 3-5 years of experience in data processing. Also required is experience in database design and analysis (IMS/VS).

SYSTEM DESIGNERS

We seek skilled design professionals that have extensive background in analysis and user interface. A Bachelor's degree is strongly preferred, as is experience with IMS DB/DC. A minimum of 2 years experience in application development in COBOL programming is essential. Exposure to micro's and mini's is helpful.

We offer an excellent salary and highly regarded benefits in addition to a climate that is sunny year-round, a generous relocation plan, and no state income tax. Send your resume with salary history in strictest confidence to: Mr. Ron Ervin, H.E.B. Grocery Company, P.O. Box 19000, San Antonio, Texas 78219-0200. Or call collect (512) 828-9221.

We are an Equal Opportunity Employer.

FIELD ENGINEERS

Tymshare, a recognized leader in the management of computerized information and communications services, is currently seeking field engineers in the Los Angeles and San Francisco areas. The successful candidates will have a minimum of five years mainframe repair experience, including two or more years of DEC PDP 11 or VAX experience, and the capability to perform on-site hardware repairs. These are intermediate level positions.

For immediate consideration, please call collect or send your resume to:

Tymshare, Inc.

Seven years ago, DATAPOINT introduced the world's first local area network, ARC® (Attached Resource Computer), and ignited a revolution in business communications. Today DATAPOINT continues to lead the way in versatile hardware and advanced software designed to meet the needs of modern business.

ARC local area networks are integrated in businesses around the world, linking multifunction workstations, printers, display systems, and processors. Providing machine to machine communications, working together with systems so advanced, they could only be DATAPOINT.

Others have joined the revolution, but DATAPOINT is the undisputed leader with more than 5,000 ARC local area networks installed. More than IBM, Xerox, and Wang combined. We are a proven success that can provide a basis for your successful sales career.

We now have positions available in almost every major market across the country. If you are a degreed sales professional with a solid track record in computer sales, call our 24 hour career hotline to learn about the DATAPOINT success and how you can join this growing team of professionals.

DATAPOINT
We sparked the revolution.

The California Institute of Technology, renowned as a center of education and research of the highest caliber, is seeking experienced professionals to fill the following positions:

Assistant Director, Software Development

Working closely with other concerned members of the campus community, this individual will identify, design and implement software systems at Caltech. This will include project management, continuous review of developments in local area networking and operating systems, supervision and/or project implementation, promotion of the initial release of new products, and supervision of the development of documentation and seminars, as required. This senior-level position requires a Bachelor's in Computer Science or related field plus at least 5 years of appropriate experience or, preferably, a PhD. A demonstrated knowledge of modern operating systems, programming languages, software architecture and software management is also required.

Educational Computing Project Leader

Reporting to the Dean for Educational Computing, this individual will coordinate the integration of computers into the Caltech curriculum. In doing so, this individual will provide advice and technical support on the hardware and systems software of various equipment used in educational computing; supervise and/or author various software projects, especially the necessary graphics packages needed in the broad scientific education provided by Caltech; review, in detail, developments in networking, graphics, databases and other relevant packages developed by groups at Caltech and JPL; and maintain a broad understanding of overall developments in this field. This position requires a broad knowledge of modern computer hardware and software, as well as an expertise or interest in scientific application programming. In addition, a Bachelor's or equivalent in both Computer Science and another science, along with the ability to manage software projects and supervise students, is required.

Both positions require individuals with excellent oral and written communication skills, as well as the ability to work independently. For consideration, please send a resume with salary requirement to: Supervisor of Employment, CALTECH, Pasadena, CA 91125. *Equal Opportunity Employer M/F*

Caltech

DATA PROCESSING SYSTEMS ANALYST

Boise, Idaho

The Idaho Department of Health and Welfare is accepting applications for two positions in Boise.

These positions analyze and evaluate user problems and formulate logical statements of business problems; devise procedures for solutions of the problems which may involve the use of data processing systems and programming.

Positions require experience with documenting computer procedures, writing administrative procedures, developing program specifications, designing application systems and project scheduling when planning the development of a new project. Also requires background as a project leader and experience making presentations to users and/or management.

Salary range is $23,388 to $31,392 (negotiable) plus good fringe benefits program. For application forms, contact Joan Swanson, Health & Welfare Personnel, 450 W. State, Boise, Idaho 83720 or call (208) 334-4088. Please reply to advertisement by February 14, 1986.

There's only one name you need to know in leasing.

Greyhound.

When it comes to equipment for your company, there are a lot of decisions to be made. Decisions like whether you purchase or lease, where to actually find the equipment you need, and how to finance it.

To make those decisions, all you need to know is Greyhound Computer Corporation. Whether you decide to lease or purchase, we'll work with you to customize your equipment for your particular business. And we'll also work with you on the financing of that equipment.

At Greyhound Computer Corporation we've been leasing, servicing, refurbishing, maintaining and providing financing for computer and other equipment for over 20 years.

So the next time you have a lot of decisions to make about high-tech equipment, make them easier. Call Greyhound Computer Corporation.

MISSISSIPPI CENTRAL DATA PROCESSING AUTHORITY

Sealed proposals will be received by the CDPA, 508 Robert E. Lee Building, Jackson, MS 39201 for the following data processing equipment and services:

Request for Proposal No. 890, due 3:30 p.m., Friday, February 17, 1984, for the acquisition of a computer system capable of running the MUMPS interpreter and COSTAR application software for the Mississippi State University College of Veterinary Medicine.

Request for Proposal No. 891, due 3:30 p.m., Wednesday, February 22, 1984, for the acquisition of a LISP-based microcomputer system that will be used for artificial intelligence studies by the Mississippi State University Computer Science Department.

Detailed specifications may be obtained from the CDPA office. The CDPA reserves the right to reject any and all bids and proposals and to waive informalities.

"A COMPUTER LEASING COMPANY'S FINANCIAL STABILITY IS VITAL."

We said that in 1973, when Randolph became a subsidiary of The First National Bank of Boston . . . and we say it again, because it is still true and even more important today.

As an important part of The First National Bank of Boston, one of the nation's oldest and leading financial institutions, Randolph has a built-in financial stability that continues to be unique in the third-party computer leasing industry.

LEASING COMPUTERS IS OUR ONLY BUSINESS.

Randolph specializes in leases for IBM 3081, 303X and 4300 computer systems and peripherals . . . firm evidence that we plan to perpetuate our computer leasing activity.

Our people have an average of 18 years experience in the DP industry . . . from 360's to 3081's. They know all about alternative financing to be sure, but they also know their way around a DP department and the hardware in it.

WE SPECIALIZE IN SOLVING PROBLEMS.

Machine installed on a rental basis? Long wait for delivery? Stuck with a lease on your old machine? Own a 3081 but need cash? Whatever your problem, we can tailor a lease that will fit your exact needs and let you start saving money right away.

SAVE $80,000 EVERY MONTH FOR THE NEXT 5 YEARS.

You can lease the same 3081 that IBM rents for more than $180,000 per month from Randolph for less than $100,000 per month. If you're renting an older machine, we can save you even more—and you'll get about 4 times the throughput in the bargain.

WHEN IS THE BEST TIME TO TALK TO RANDOLPH?

The sooner the better. But it's never too late, even if you already have a machine installed.

Our 19 years in computer leasing gives added assurance that Randolph will continue as the leader in the computer leasing industry . . . continue to live up to the terms and conditions of our agreements . . . provide upgrades . . . fulfill all of our commitments.

LET RANDOLPH HELP YOU GET THE SYSTEM YOU NEED NOW, *NOW*.

We've already done it for many of the Fortune 500 companies . . . and we can do it for you. Call Joseph B. Kelly, Jr., Executive Vice President. 800-243-5382

BIDS & PROPOSALS

REQUEST FOR PROPOSAL

The City of Alexandria, Virginia, Public Schools, will receive and open proposals in the Finance Office, 3001 West Braddock Road, Alexandria, VA 22302 on March 1, 1984 at 2:00 pm for a HUMAN RESOURCE MANAGEMENT SYSTEM. The Alexandria City Public Schools reserves the right to disregard any irregularities in any proposal and to reject, without explanation, any or all proposals. Proposal information may be obtained from the City of Alexandria School Board Administration, Finance Office, 3001 West Braddock Road, Alexandria, VA 22302, between the hours of 8:30 am and 4:30 pm, Monday thru Friday. The telephone number in the Finance Office is (703) 998-2100.

John D. Johnson, III, Superintendent of Business Services and Transportation

RFP Number 83-84-005

Request For Proposal
Automated Circulation Control System

The Brooklyn, Queens Borough, and New York Public Library will be accepting proposals for an automated system to control the circulation of library materials. The total system must be capable of supporting in excess of 40 million circulation, plus related transactions entered at more than 600 terminals located throughout the City of New York. Proposals are to include the equipment for a communication network to support this system. However, vendors of communications equipment may submit proposals for these facilities separately. A Request for Proposal (RFP) for this project may be obtained by writing to Ms. Barbara Tregar, NYU Circulation Control Project, The New York Public Library, Tilden Building, 455 Fifth Avenue, New York, NY 10016. Request for a copy of the RFP must be accompanied by a non-refundable fee of $50 payable to the New York Public Library by check or money order to the New York Public Library.

"A request for information for Automated Pupil Transportation Routing System is available to prospective bidders. Contact Mr. Kevin Alworth at (212) 784-3313, extension 264 for additional information."

COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Burroughs, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 451) should be clearly typewritten. Ads may be given over the phone to our team of ad takers. The standard size is 1 column by 1 inch deep. These units may be combined to form larger sized ads. Describe the equipment very briefly, give the price and the name of the person to contact. All ads will be set up using a standard format. No borders or logos are allowed.

Cost: The price for each standard unit is $130.00 (One unit minimum and no fractional units allowed.) There are no agency commissions and no quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

SOFTWARE FOR SALE

Software Tools for the VAX and PDP-11

Evans Griffiths & Hart, Inc. offers packages for VMS, RSTS/E, and RSX-11M that save time and improve productivity

DATA ENTRY

- **KDSS**, a complete multi-terminal key-to-disk data entry subsystem.
- **TAM**, an efficient multi-terminal screen-handling facility for the development of transaction-processing applications.

RSTS/E MIGRATION TO VAX/VMS

- **BOSS/V**, a RSTS/E subsystem for VAX/VMS written in VAX-11 MACRO. Supports an extensive subset of RSTS/E monitor calls. Provides most of the standard RSTS/E features, like CCLs, send/receive, shared libraries, RSX directives, and RSTS/E-style file update mode. (Also distributed by Online Data Processing, Inc.).

DATA COMMUNICATIONS

- **DIALUP**, a comprehensive, efficient link between RSTS/E and other systems using asynchronous terminal lines. Supports CPU-efficient, reliable file transfers, virtual terminals, auto-dialing, and the use of command files and macros.
- **BSC/DV**, a device driver for the DEC DV11 synchronous multiplexer. (VMS and RSTS/E only).
- **COLINK**, a convenient, efficient link between two RSTS/E systems using DMC11s or DMR11s. Supports file transfers, virtual terminals, and across-the-link task communication.

RECORD SELECTION & SORT UTILITIES

- **VSORT & FSORT3**, extremely fast sort packages for VMS and RSTS/E.
- **VSELECT & SELECT**, extremely fast VMS and RSTS/E packages for scanning files to extract records that meet user-specified selection criteria.

Need general accounting software for IBM System/38?

We've simply solved your problem.

LAWSON ASSOCIATES has solved it with the first general accounting software specifically designed for IBM System/38. Not merely compatible, but state-of-the-art to fully utilize your computer's capabilities. Compare. You won't find a total software solution like it anywhere else.

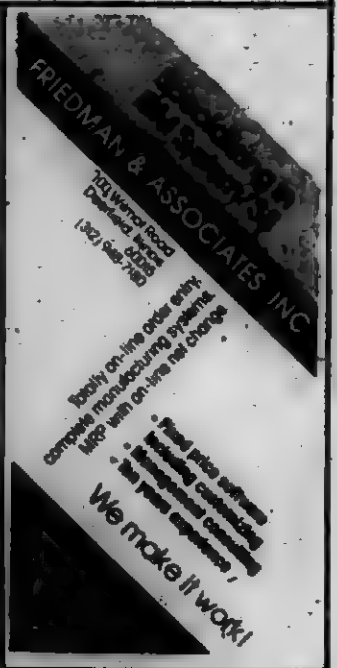
DESIGN FEATURES: They include: on line systems using data base management; menu driven, user friendly programs written in RPGIII, the System/38 language; and integrated modules. Their benefits: ease of installation and use, plus maximum employee productivity.

INTEGRATED MODULES: Those available include: General Ledger and Report Writer/Accounts Payable/Accounts Receivable/Fixed Assets/Payroll/Personnel/Purchase Order/Order Entry/Inventory Control

SERVICE FEATURES: Fully documented and supported. Onsite training and implementation. One year warranty. Available now for immediate installation.

For more information, please call or write:
Lawson Associates, 2021 East Hennepin Ave., Minneapolis, MN 55413
(612) 379-2633

LAWSON ASSOCIATES
WE SIMPLY SOLVE PROBLEMS



CURIOUS ABOUT CLASSIFIEDS?

If you are interested in advertising with Computerworld, but don't know how to do it, give us a call! We'll be glad to send you our current rate card, which explains sizes, costs, deadlines and requirements. Along with that, we'll send a demo paper which actually shows examples of ad sizes, typefaces, and prices. Our toll free number is **800-343-6474, in Massachusetts call 879-0700, just ask for Classified Advertising.** Or, you can look for our classified order form located in the classified section of Computerworld. Fill it out, attach your ad with a check, and return it to us. We're at 375 Cochituate Road, Box 880, Framingham, MA 01701. Send attn: Classified-Advertsing. We're anxious to help!

The Proven Solution

***SAFS™ Financial Systems for the IBM S/34, 36, 38**

Find out why major corporations and smaller companies alike are glad they turned to SAFS™ financial software.

Accounts Payable • General Ledger
Fixed Assets • Payroll • Word Processing

Features Include:

- use of up to 13 fiscal periods
- MAPICS conversion facility
- true multi-company design
- consolidated statements
- simultaneous multi-period processing
- data base design
- written in RPG II/RPG III

Support • Service • Custom Enhancements

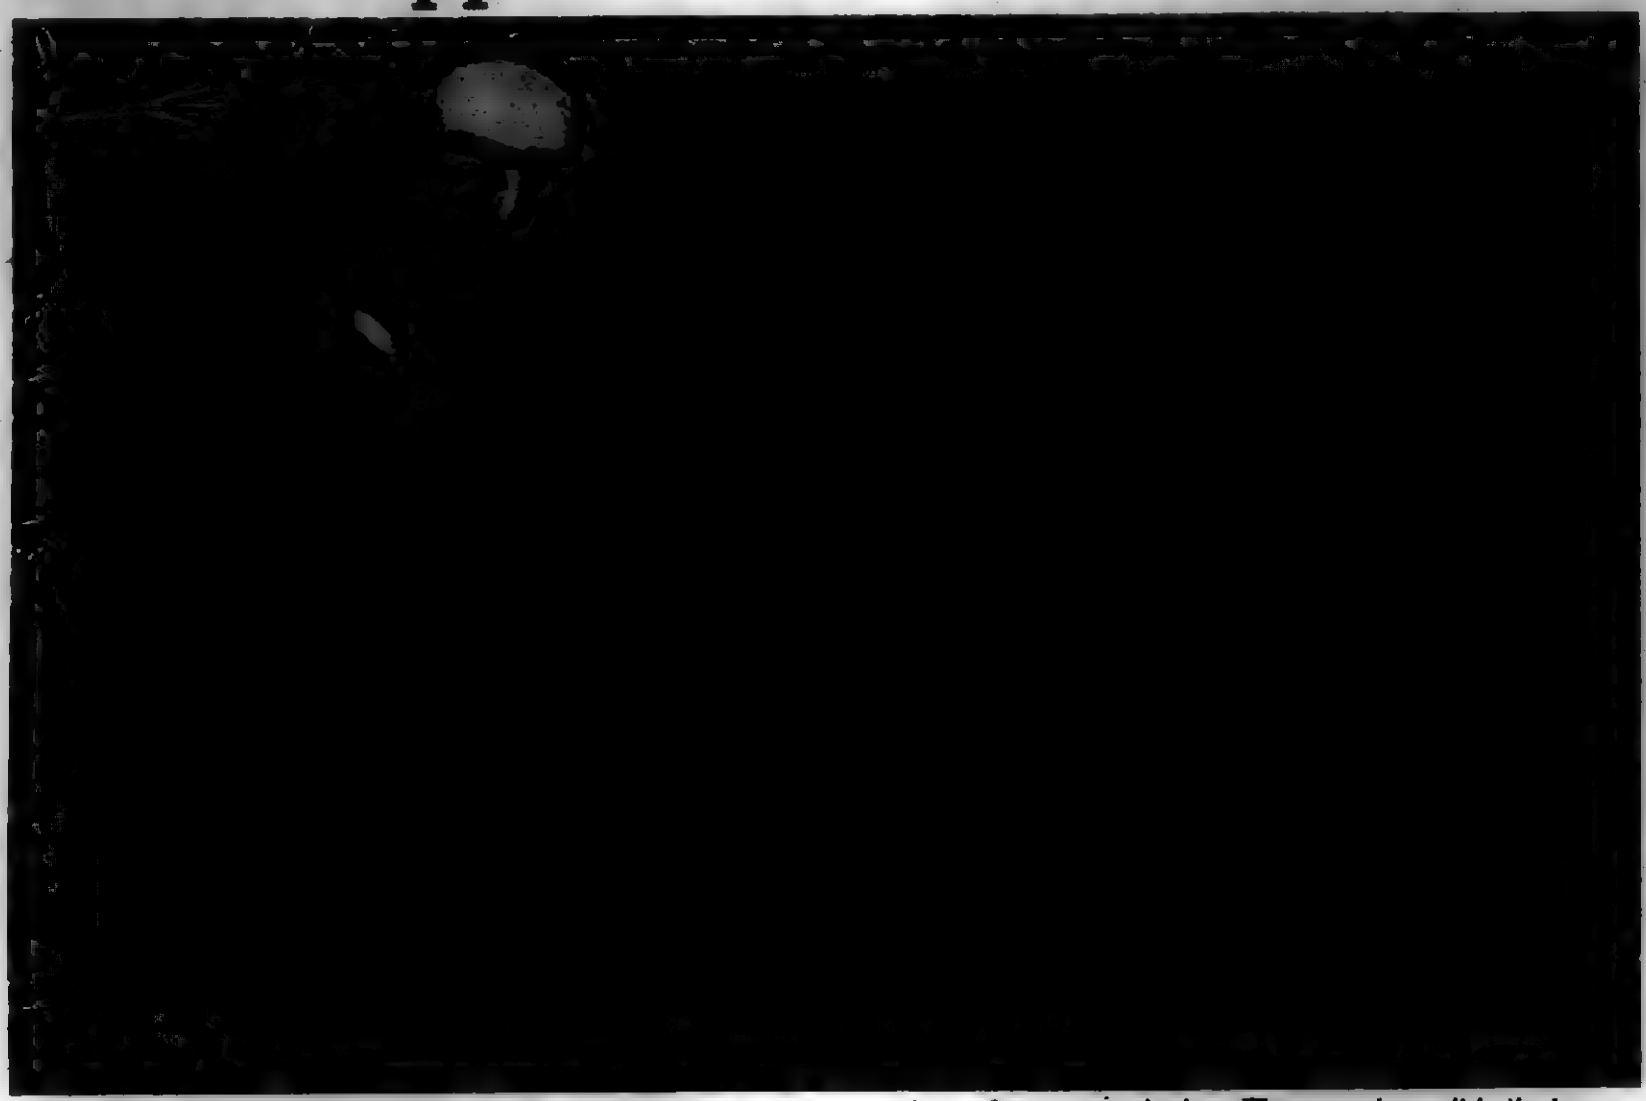
The man who taught financial software to A.B. Dick, Alberto Culver, Hershey Foods, Hartz Mountain, Howard Johnsons, Newsweek, National Steel, Philip Morris, Parker Pen, Pabst, Pillsbury, Pepsi-Cola and Dr Pepper.



He's Alan Rick, a McCormack & Dodge training instructor. A member of a teaching team which has won the reputation, hands-down, for the best hands-on training in the financial software industry.

Clients find our training schools as valuable as our software packages. Enrollment has grown from less than 300 in 1977 to over 3,000 in 1981. People have come from more than 150 Fortune 500 companies. From departments with such demanding workloads that any system but the fastest and most powerful is simply out of the question. Whether it's for accounts payable, capital projects analysis, fixed assets, general ledger, payroll/personnel or purchase order management.

At McCormack & Dodge, we work hard to make our schools—and our entire company—as user-oriented as the software we design. The usual result is that people who sit down and talk to us do more than just talk. They become customers. We'd like to show you why.

Tomorrow's software today.

Investors sue after STC ices CPU project

SAN FRANCISCO — Storage Technology Corp.'s recent cancellation of a project to develop an IBM-compatible processor resulted in the filing in federal court here last week of a class action suit charging the company with securities fraud and racketeering.

The suit, filed by the Chicago law firm of Katten, Muchin, Zavis, Pearl & Galler, charges STC with stock fraud and seeks actual damages of $10.6 million and punitive damages of $20 million. It also seeks unspecified additional damages that may be tripled under the provisions of the federal Racketeer Influenced and Corrupt Organizations Act, a statute generally used by the federal government to prosecute organized crime figures.

Donald E. Egan, the attorney who filed the suit, charged that STC had created a partnership to finance the processor project and, four months before canceling the project, obtained $10.6 million from 181 new limited partners who were given "written statements and misrepresentations of material facts that were untrue or misleading."

Also named in the suit was the investment firm of Smith, Barney, Harris, Upham and Co.

STC killed the project to develop a high-performance, IBM-compatible mainframe after citing technological problems and increasing cost estimates [CW, Feb. 6].

At press time, STC had no comment.

Supermini hits campaign trail with Cranston

CAMPAIGN '84

By James Connolly
CW Staff

WASHINGTON, D.C. — What may be the most sophisticated in-house computer system ever used by a presidential candidate is helping U.S. Sen. Alan Cranston (D-Calif.) in his try for the Democratic nomination.

Cranston, ranked as low as sixth in polls that show him more than 40 percentage points behind former Vice-President Walter Mondale, apparently is the only one of eight candidates to use a minicomputer and the first to use a supermini in his campaign headquarters.

Like the competing organizations, the Cranston campaign uses computers for mass mailings of political and fund-raising letters, for scheduling and for income and expense reports for the Federal Election Commission. But while the other campaigns use service bureaus and in-house microcomputers, the Cranston for President Committee has a Digital Equipment Corp. VAX-11/750 in its headquarters here and DEC Rainbow micros in its New Hampshire and Iowa field offices.

"We made a decision well back in 1982 to go in-house," Alex Thurber, the committee's director of information systems, said. "A campaign doesn't have the time to wait for someone else to do its processing. We

M&D offering tool to build applications

By Paul Gillin
CW Staff

NATICK, Mass. — McCormack & Dodge Corp. last week continued its foray into the systems software market by releasing as a package the system development software used to build its Millennium application series.

Millennium:SDT can be used to build IBM CICS applications that are fully integrated with mainframe-based M&D Millennium applications, including general ledger, fixed assets, human resources, accounts payable, purchase order and capital project analysis.

The package incorporates both interpretive and generative capabilities as well as reusable code, M&D said. Application definition is accomplished by creating data base records for files, records and fields, screens, queries and search fields.

M:SDT programs can call literals, variables and parameters and map them directly to the screen, eliminating CICS mapping and security, according to an M&D spokesman.

M:SDT uses M&D's procedure definition language, Millennium:PDL, to access and process data within the data bases. M:PDL uses an English-like syntax and arithmetic and logical operators to execute complex expressions.

On-line features offered with M:SDT and all Millennium products include multi-

PROFILE

He heads 'two-in-one' department

By James Connolly
CW Staff

SMYRNA, Tenn. — Logic says it is a mismatch, a marriage in which the partners have little in common and little to say to each other.

But Nissan Motor Manufacturing Corp. U.S.A. says that upon closer inspection, the "mismatch" makes sense.

Nissan merged its information systems with its purchasing department.

The apparent illogic lies in the fact that the departments cover so little common ground. But "we put the two groups together because they don't go together," emphasized Robert A. Frinier, who became vice-president of purchasing and information systems on Jan. 1.

"We think we figured out a way to have systems report to a division where it can be run without bias," Frinier explained. "Purchasing in this facility doesn't place much of a demand on the [DP] systems, at least much less than finance or production control. Our consultants said the systems organization needs a place where it can get top-level support and not be biased by the person in charge being primarily responsible to other areas."

That bias, he noted, could result in a department head tailoring information systems to his own needs at the expense of other departments or paying too little attention to information systems.

Frinier

"We think this concept might knock the computer industry on its ear," according to 42-year-old Frinier, who has a background in production control. Formerly with Ford Motor Co. in Michigan, he has been with Nissan since 1980, working with system users in production and with consultants and technical personnel in developing flowcharts for system interfaces between the new facility here and Nissan's headquarters in Japan.

Frinier heads a department of 70 people, some of whom previously worked in information systems when it was controlled by the Finance Division. Responsibility for information systems was shifted from the Finance Division on Jan. 1, at a time when company President Marvin

Victor petitions for Chapter 11

Third micro maker in six months to file

By Patricia Keefe
CW Staff

SAN JOSE, Calif. — Bowing to pressure from its many creditors and several lawsuits, Victor Technologies, Inc. last week voluntarily filed for protection under Chapter 11 of the U.S. Bankruptcy Code.

With an estimated $70 million in unsecured debt, Victor became the third microcomputer maker in six months to seek court protection.

Victor said its manufacturing unit, which is also named Victor Technologies, Inc., has consented to a separate, involuntary bankruptcy petition filed last week in federal Bankruptcy Court here by six creditors, whose unsecured claims total over $12.8 million. The latter petition sought to force the California-based manufacturing unit into Chapter 11, where it could reorganize and work out a debt schedule under court protection from creditors' lawsuits.

According to a statement released by Victor, two other units also filed voluntary petitions: Victor United, Inc., the U.S. distribution subsidiary, and Victor Technologies International Sales Corp.

The vendor's European and Canadian distribution operations are insulated against claims against the U.S. entities, Victor said.

Victor has reached an agreement with its largest secured creditor, Security Pacific National Bank, under which the bank will finance "near-term manufacturing and distribution needs," a spokeswoman for Victor said. That agreement is subject to approval by the Bankruptcy Court.

Victor said it will continue to supply an adequate amount of computers to its U.S. and foreign distribution outlets.

As part of a restructuring of operations, Victor has terminated 300 employees in the U.S., leaving approximately 570 employees worldwide, the spokeswoman said. Victor declined to comment further.

Second suit

Another suit filed last week, this one by the advertising and public relations firm of Doyle Dane Bernbach International in federal Bankruptcy Court in Manhattan, seeks $8.3 million — $3.3 million for services performed (media buying) and $5 million in damages. That suit accuses Victor of providing false financial statements that overstated the micro maker's true worth and failed to disclose losses suffered in 1982, according to spokesman Robert Frost. The suit also names as a defendant Kidde, Inc., which owns a majority share of Victor, and Kidde President Fred R. Sullivan.

Victor has had a tough two years financially, suffering losses of approximately $3 million in 1982 and $47 million to date in fiscal 1983. Its overall debt reportedly tops $100 million.

The Chapter 11 filing highlights the failure of a creditors' committee established in late 1983 to help Victor devise a plan for paying a debt then estimated at $90 million. Negotiations between Kidde and the committee reportedly broke down, resulting in a successful bid to force Victor into Chapter 11.

Access fee cut for Wats, kept for Centrex

By Phil Hirsch
CW Washington Bureau

WASHINGTON, D.C. — The surcharges for accessing the dial-up telephone network will remain the same for Centrex-CO (Central Office) users, but the surcharges for Wats and Foreign Exchange services will be modified, the Federal Communications Commission ruled earlier this month.

Immediately afterward, Jack Smith, chief of the FCC's Common Carrier Bureau, indicated he is still hoping for some reduction in AT&T's upcoming long-distance rates. He said he "would like to see something in the neighborhood of" a 5% to 8% reduction in the proposed rates for Message Toll Service (MTS).

The FCC's latest action on its access surcharge plan was taken at a Feb. 3 meeting. Specifically, the commissioners:

■ Reaffirmed an earlier decision under which Centrex-CO users whose systems were in place or on order as of July 27, 1983 will pay an access surcharge of $2/mo per line, while those using newer systems will pay $6/mo per line. The fees will begin April 3 and continue until sometime in 1985 when, depending on the outcome of an upcoming FCC study, they may be altered.

■ Converted the closed end of each Wats line from an interstate to an intrastate facility. Under the earlier scheme, a user would have paid a direct charge of $25/mo per line termination beginning April 3. Now the user will pay the local telephone company a maximum $6/mo per line access surcharge, plus a varying amount to AT&T based on Wats usage. The FCC anticipates, however, that the latter fee will be absorbed rather than passed on by the phone company, a spokesman said.

■ Restructured Foreign Exchange access surcharges so that at least some users of this service will pay less.

The commission decided that a telephone operating company providing local exchange facilities at the "open" or remote end of a Foreign Exchange circuit can charge only 45% of the MTS/Wats access fee rather than an equivalent amount. Although this change will tend to drop Foreign Exchange rates below what they would have been, the total bill is likely to go up significantly when compared with present rates because of pending increases for jurisdictionally interstate short-haul Foreign Exchange access circuits.

However, rates for similar long-haul circuits of 25 miles or more generally have not been increased and in some cases have been lowered, the spokesman said.

One problem that remains to be resolved, the spokesman added, involves local telephone companies not equipped to meter usage. In the past, they have charged each Foreign Exchange user for 4,400 min/mo of use, which forced those with lower calling volumes to subsidize those with higher volumes. The commission is studying this problem and a decision is imminent, the spokesman said.

NISSAN from page 1

Runyon instilled new vice-presidents for product control, engineering and planning and finance as well as for purchasing and information systems.

The highly automated plant has been producing an average of 7,000 light trucks a month since beginning production last June, according to Frinier.

"I don't have a very strong computer background from a technical point of view," the Nissan executive acknowledged.

He noted, "Initially, I'm spending 80% to 90% of my time on information systems, learning as fast as I can.

"I have people working for me who have been with information systems for a while. So they're teaching a newcomer," he said.

Thoroughbred

Meet the newest champion in the world's greatest sorting stable!

(SyncSort OS 2.5)

Call (201) 568-9700.

Find out why it takes a SyncSort to beat a SyncSort.

SyncSort OS 2.5

Performance Improvements
EXCPs: 35%
TCB CPU Time: 15%
SRB CPU Time: 25%

Here we go again—improving the Sorting Breed!

That sleek young thoroughbred out in our main paddock is SyncSort OS, Release 2.5. It's by SyncSort 2.4 out of that celebrated brood mare, High Technology. And it's destined to win a lot of prizes on OS/VS and MVS/XA tracks.

IMPROVING THE UNIMPROVABLE: Until now, SyncSort 2.4 was the best OS/VS sort program ever bred. It was far faster than any IBM sort. And it was easier to use, too— thanks to a tack-room full of advanced features.

SyncSort 2.4 probably could have continued to win prizes for years. There was only one catch—it wasn't good enough for us.

PICKING TOMORROW'S WINNERS: We knew that new hardware and software systems would create opportunities for evolution of advanced sort programs. Speed would still be essential. But productivity would continue to skyrocket in importance. So that's the way we bred 2.5.

FASTER SORT PERFORMANCE: We've added new sorting techniques to SyncSort 2.5 to make it the only sort that outperforms 2.4. You can expect savings in critical resources up to those shown at lower left. And that can add up to a big increase in total systems throughput.

NEW PROGRAMMER PRODUCTIVITY FEATURES: As any seasoned sort-watcher knows, there's a lot more to data handling than sorting. SyncSort 2.5 introduces a Data Utility set that applies its proven techniques to a wide range of processing and reporting jobs.

For example, with a single execution, 2.5 can sort, format and present data in virtually any form you want:

- **SortWriter**—a powerful tool that can produce extensive reports as a by-product of your normal sorting—without user exits and the associated programmer investment. Headers, trailers, total and sub-total capabilities provide flexible formatting.
- **Record Formatting**—To existing features like INCLUDE/OMIT, INREC/OUTREC, SUM and others—all of which have been expanded—2.5 adds new and useful capabilities like data conversion, editing, insertion of literals.
- **Multiple Output**—From a single sorted file, you can create multiple files and reports. Each can include the same or different data as determined by INCLUDE, OMIT, OUTFIL or OUTREC parameters.

If you're tired of betting on sort programs that empty your pockets of resources and are tough to handle, give us a call. We'll arrange to have SyncSort OS 2.5 run a few furlongs on your own turf.

DEC enters records management business

By Bill Laberis
CW Staff

Eyeing a potential $2 billion-plus market, Digital Equipment Corp. is slated to announce today that it is diving headlong into the records management business, the boldest such move to date of any major computer vendor.

DEC has committed an undisclosed but obviously substantial capital investment to state-of-the-art facilities in Burlington, Mass., and will open similarly sized facilities in Chicago, Los Angeles and Toronto by mid-spring.

The company will open an additional 20 off-site storage and recovery facilities during 1985 and another 17 the following year, giving the company the most extensive records management network in the industry. The 41-site network will place a DEC facility within driving distance of more than three-quarters of the major DP shops in the U.S., the company claimed.

"Our commitment is national. We see a very large vacuum in this area, and users are rapidly awakening to the need for such services," said David B. White, national marketing manager for DEC's Record Management Services, headquartered in Stow, Mass. "It's a question of demand-pull, and that demand is getting much stronger."

Records management and off-site storage, White said, is not practiced as a very sophisticated art at many DP shops. Storage and protection of vital tapes and disks often consists of placing the material in an on-site cabinet. White cited one Boston-area information manager who protected vital disks by taking them home at night and locking them in her bedroom closet.

"A study we undertook showed a U.S. market for off-site records storage of about $2 billion annually," said David L. Early, DEC's Records Management Services manager. "We also found there are no vendors operating in all major U.S. cities, which we will."

Early said that about half the existing market is serving its own storage needs, including those DP sites that store records in cabinets and closets. Only about 15% of the potential market is being served by outside records management vendors.

CW photo by B. Laberis

White

DEC is banking on users becoming more aware of potential disasters that could cripple both DP and corporate operations if adequate off-site storage and backup is not provided.

Through a series of seminars being conducted around the country, DEC is trying to convince DP managers that extra care should be taken to protect corporate information assets and that this extra care should be extended to off-site storage. DEC is initially targeting users in high-transaction environments, such as banking, hospital and computer-aided design and manufacturing shops.

DEC's Burlington facility is equipped with massive, climate-controlled vaults for storing either paper, hard disk or tape records. Individual records are identified only by bar coding. Each vault is protected by six levels of security before entry can be gained, and each can store 200,000 disk packs or 157,000 tapes.

The location, type and processing requirements of each record are controlled by an in-house VAX-11/750 superminicomputer paired with a series of DEC RM05 disk drives. The site, identical to the others planned for DEC's network, will feature tape and disk reconditioning equipment.

Honeywell drops some DPS 8, DPS 88 purchase prices

PHOENIX — Honeywell, Inc. recently dropped the purchase price on most of its DPS 8 and DPS 88 mainframes, lopping off as much as $200,000 from the price tag of some models. Lease and rental prices were not affected.

Highlights of the price-cutting announcement include:

■ Reductions of up to 20% on DPS 8/70 and DPS 8/62 processors using the firm's Gcos, Multics and CP-6 operating systems.

■ A 12% reduction in the purchase price of add-on processors for the DPS 8/70, DPS 8/62 and DPS 8/49 lines.

■ Price reductions ranging from 32% to 58% for upgrades on some DPS 8 models and reductions of 20% on memory upgrades for the entire DPS 8 and DPS 88 mainframe lines.

■ A 30% reduction in monthly maintenance fees for some DPS 8 models.

■ An extension of the warranty on all DPS 8/52, 8/62 and 8/70 processors from 30 to 90 days.

All of the price changes are in effect now, a spokeswoman said. For example, the purchase price of a DPS 8/62 CPU running under the Gcos operating system was cut $130,000 and now costs $550,000. The DPS 8/62M, which uses Multics, was reduced from $725,000 to $595,000, and the DPS 8/62C (the CP-6 version) was reduced from $825,000 to $695,000.

Honeywell's top-of-the-line DPS 8/70 was reduced $200,000. A central system using the Gcos operating system now costs $700,000. The Multics and CP-6 versions of the system were also reduced by $200,000; the 8/70M costs $750,000, and the 8/70C now costs $800,000, the spokeswoman said.

The prices of additional processing units for the Gcos, Multics and CP-6 versions of the 8/70 were cut 12%, from $655,000 to $575,000. The price of an additional processor for the DPS 8/62 was cut by 5%; it now costs $475,000.

The purchase price for the DPS 8/49 and 8/49C processors was dropped from $175,000 to $135,000.

The cost of migrating to larger configurations of the DPS 8 line was cut by as much as $90,000. As an example, the Honeywell spokeswoman said, an upgrade from a DPS 8/47 to an 8/49, which formerly cost $52,000, now costs $22,000.

The price cuts were made by Honeywell's Large Computer Products Division, P.O. Box 800/a-79, Phoenix, Ariz. 85066.

CRANSTON from page 1

like to have some lead time when we're working on a project, and a service bureau doesn't always allow you that."

Moreover, Thurber said, "the cost isn't comparable. It would be two or three times more expensive for us to go outside."

Cranston's system has 10 DEC VT102 terminals and two DEC LN01 laser printers. The printers produce 36,000 pages of letters and reports each week. Leased for $10,000 per month, the system includes 4M bytes of internal and 500M bytes of disk storage.

The committee's Issues Department uses the system as a word processor to develop position papers, usually drawing on stored reference materials that Cranston has built up as a senator.

Two terminals are used to process response mail, requests for position papers, campaign literature and campaign materials such as buttons and bumper stickers.

The scheduling office uses two terminals not only to coordinate the candidate's schedule, but to compile the two or more screens of data he will need for each personal appearance.

That data includes a crowd profile for political and security purposes and a list of the type of questions the candidate might be asked. The office also gathers similar materials for VIPs who might substitute for Cranston.

Other terminals are used by the campaign treasury, which compiles monthly reports for internal and FEC use on funds raised and expenses. The system tracks contributions to determine if they qualify for federal matching funds or if a contributor may have exceeded the legal limit. The data base for the fund reporting uses 50M bytes of storage and has names and other information for 31,000 active contributors.

The final two terminals are used for direct voter contact, compiling mass mailing letters and envelopes that are assembled and shipped by an off-site mail service and for updating telephone lists for the phone banks in field offices.

At any given time, the telephone banks may have access to 300,000 names of probable voters, caucus attendees and people whose backgrounds indicate they might support a Cranston candidacy. Those lists are forwarded to field offices in New Hampshire, Iowa and other early primary and caucus states. There, telephone interviews narrow the lists to identify the people Cranston targets, and the results are recorded on magnetic tape for entry into the headquarters' computer.

The people on the new list are then targeted for follow-up letters, which are sometimes personalized to reflect the concerns that were discussed with the telephone workers days before.

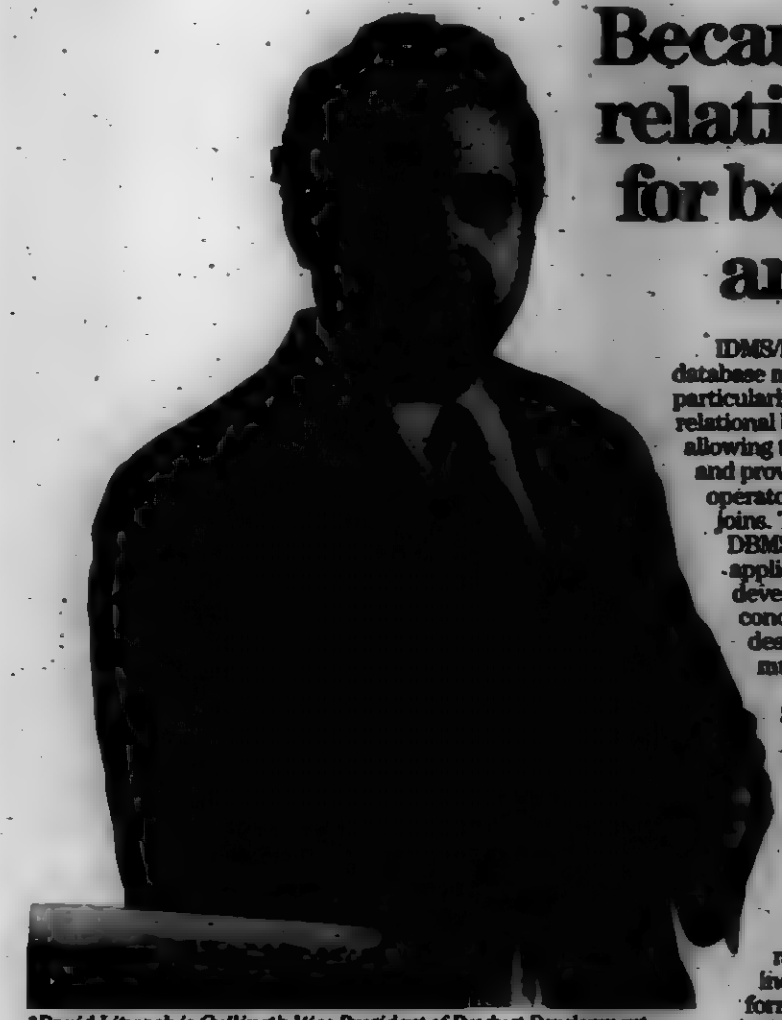
"IDMS/R represents a major advance in database technology."

Dave Litwack*



*David Litwack is Cullinet's Vice President of Product Development. Mr. Litwack has contributed significantly to the many technical advances Cullinet has achieved in database software products, including IDMS/R. Mr. Litwack joined Cullinet in 1976. He is a Cum Laude graduate of Brandeis University and holds a Masters in Computer Science from Boston University.

Because IDMS/R is the first relational DBMS designed for both the DP professional and the end user.

IDMS/R is not only a relational database management system, but a particularly powerful one. IDMS was made relational by removing all pointers and allowing the user to define data as tables and providing the traditional relational operators such as selects, projects and joins. The major benefit of a relational DBMS is the capacity to develop applications faster because the developer does not have to be concerned with the database design. IDMS/R provides this and much more.

For example, the Automatic System Facility (ASF) of IDMS/R is a major advance over fourth generation languages. The ASF is so comprehensive and easy to use that all a user need do, to develop an application, is define a relational record. The Automatic System Facility dynamically generates all necessary supporting structures including data definitions, screen formats, application processing logic, and documentation. So, the developer can witness the application being produced, literally, in seconds. This capability makes IDMS/R the perfect system for the end user.

Data processing professionals can use the ASF to help develop production applications. The ASF can be used to build a prototype that can be enhanced, using Cullinet's fourth generation language, ADS/OnLine, into a complex production application. But, when they build a complex high volume application using IDMS/R, DP professionals require outstanding performance. Typically, 5% of the data relationships (joins) in any application are accessed 95% of the time. With IDMS/R, they can simply change these relationships to predefined joins and benefit from a dramatic boost in performance. We call it Relational Fastpath. Relational Fastpath makes IDMS/R a unique DBMS and a perfect system for DP professionals' system development needs.

In addition, IDMS/R has the most sophisticated back-up and recovery capability of any DBMS, full integration with personal computers and is also integrated with Cullinet's complete line of financial and manufacturing applications.

In summary, IDMS/R was designed to satisfy the requirements of those who want to develop applications faster and those who have the responsibility of processing them.

For further information, attend a Cullinet Seminar. Mail the attached coupon or call Cullinet at 1-800-225-9930 (in Massachusetts, 617-329-7700).

M&D from page 1

less query, multilevel security, screen building and Auditrack, which maintains a history of file maintenance transactions.

The product substantially reduces I/O by creating a separate record, which includes screen formats, the spokesman said. "Once a screen is formatted, a call is issued for the data rather than the screen specifications," he explained. Data is reformatted and normalized before loading into the application.

Millennium builds a component that summarizes the screen format, bypasses CICS mapping and allows the entire screen to be retrieved as one component. "There is only one I/O and one normalizer," the spokesman noted.

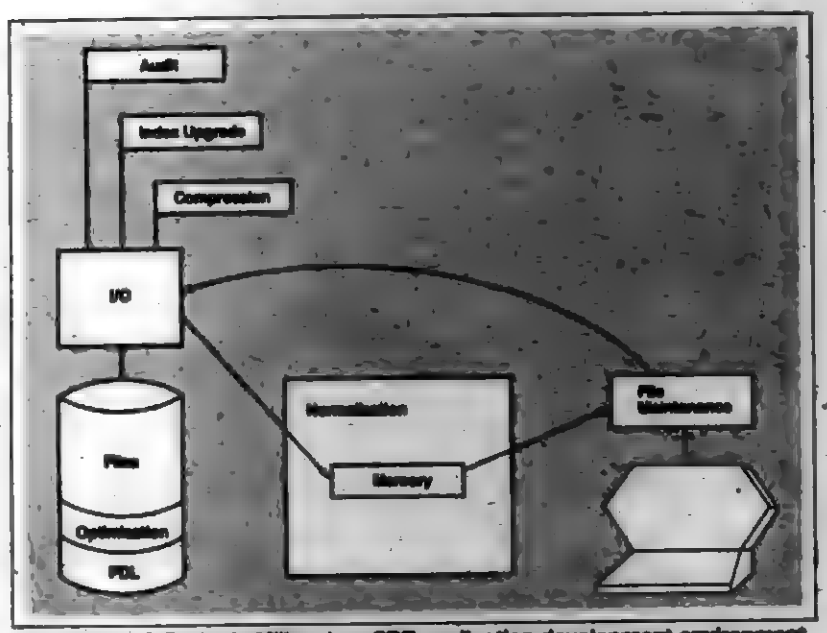
PDL uses macros to allow subroutines from Cobol or PDL programs to be loaded and linked into M:SDT applications, according to the vendor. A normalizer checks the data dictionary to handle field discrepancies within programs, and an on-line logic tester checks the logic to ensure that the code is executable.

When the program compiles, it is "normalized" as a single record, which reduces program size, the spokesman said. For example, the company's G/L Plus package consumed 900K bytes of virtual memory in its original form, but occupies only 700K bytes after normalization.

A separate index called a "key file" resides on the host and maps back to the physical data. Data can thus be presented in any logical view desired by the user.

M:SDT can be used either to develop new applications or to modify existing on-line or batch applications, according to John Landry, senior vice-president of research and development. "Millennium doesn't know one of our applications from somebody else's," he said. "It gives you the ability to retrofit existing applications using standard [IBM] Vsam files. You can be processing on-line general ledger and jump to batch, and Millennium doesn't know the difference."

M:SDT also incorporates a "screen hold" feature, which lets the user suspend a dialog with one application, start a dialog with another application and return to the original dialog. Up to 99 such "pages" can be initiated and suspended concurrently.



McCormack & Dodge's Millennium:SDT application development environment

Software developed under M:SDT is also fully compatible with M&D's Interactive PC Link connection between the IBM Personal Computer and the mainframe. Requests can be defined on the Personal Computer and data downloaded and uploaded from mainframe applications.

Available immediately, M:SDT licenses for $90,000 from M&D, 1225 Worcester Road, Natick, Mass. 01760.

ANALYSIS

M:SDT signals M&D attack on 'total solutions' mart

With its announcement of Millennium:SDT (M:SDT), a systems development tool, McCormack & Dodge Corp. (M&D) has clearly stated its intention to attack the "total solution" market already targeted by a number of systems software vendors.

The release is the company's third announcement in the past 13 months centered around Millennium, a development tool that uses a data base approach to build integrated applications.

By releasing Millennium as a product, M&D is taking a tack similar to that of Cullinet Software, Inc., which writes applications in its own Application Development System/On-Line development product, and Hogan Systems, Inc., which offers Umbrella, the development system it used to build its line of applications.

M&D officials believe the company is better positioned to attack the systems market than are vendors that are tied to an older generation data base management system (DBMS) on which applications are built.

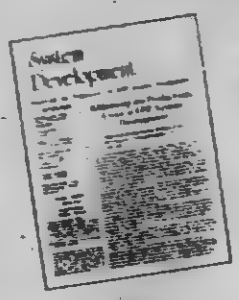
The company's Millennium development environment is organized around the inverted list DBMS, an architecture that is gaining popularity because it can offer a variety of logical user views while still providing for easy mapping through the data elements. In an expensive development effort, M&D is gradually rewriting nearly all of its applications using Millennium.

M:SDT is not intended to be sold stand-alone for customers not using M&D applications. But that does not mean M&D will not offer stand-alone systems software in the future. M&D said a separate DBMS product is within the realm of possibility, and John Landry, senior vice-president of research and development, affirmed that the company is considering releasing a version of Millennium for IBM's Personal Computer XT/370 for use primarily as a development tool.

How to improve productivity in EDP system development

System Development

The Newsletter for Improving Productivity in EDP System Development



Each issue of System Development contains the latest ideas and developments to help you ensure the timely completion of system projects, reduce growing development backlogs, and control development backlogs, and control development costs at all levels. We continuously survey the field and highlight the most practical ideas for productivity improvement from user experiences, conferences, the literature, and products. You get a concise, monthly review of the best ideas and methodologies in use.

- Save time each month in reading and research—we bring it all together
- Just one important idea could save you thousands in development costs

$75.00/Year

☐ Please enter my trial subscription to System Development and send me the first month's issue FREE. If I wish to keep System Development coming for the next year I will honor your $75 invoice.

Sperry to teach quality circles

PRINCETON, N.J. — Sperry Corp. is taking its internally developed quality circles program public via two five-day facilitator training sessions scheduled for Feb. 27-March 2 and March 26-30 at the Nassau Inn here.

The program was developed by Sperry's Computer Systems Education Center and facilitators throughout the company. It consists of three levels of training, including special programs for facilitators, leaders and group participants.

A quality circles facilitator trains the leaders and acts as a coach, communicator and overall coordinator of the circles.

The sessions run from 8 a.m. to 5 p.m. Registration for both training sessions is limited to 24 participants. Each session costs $795, which includes handouts and manuals, but not hotel accommodations.

More information is available from Sperry through P.O. Box 1110, Princeton, N.J. 08540.

The problem you may not know you have

There is a bug in every Cobol program in your library.

You probably don't know about it, and you almost certainly haven't had to worry about it yet. But when it shows up, it will hit your entire shop, reducing data entry procedures to a mush of error messages.

By Paul Gillin
CW Staff

NOVI, Mich. — When systems analyst William Schoen has presented DP managers with that pitch, he has understandably piqued their interest. But he has had trouble getting them to take his case seriously when they find out what the bug is.

The problem is the year 2000. The turn of the calendar presents a procedural issue that is acknowledged occasionally in trade conference jokes and DP shop banter but has attracted little serious attention in the industry.

The root of the issue is the industrywide standard of using two-digit date fields in Cobol programs. Error-checking procedures typically rely upon dates proceeding sequentially, with one year's date being greater than that of previous years.

However, programs will be thrown for a loop after the turn of the century when they have to cope with the two-digit date field "00" being greater than "99." Schoen ticked off the problems that will arise if the issue is not dealt with: "Program logic is going to malfunction all over the place. Sequential data processes are going to abend. A great many on-line modules won't accept the new dates because they include sequence checks. Most sorts won't work, and a great many literals won't work."

200???
S M T W T F S

Perhaps understandably, the issue has received little serious attention from a DP community that is concerned with more immediate problems. But Schoen claims data processing should start paying attention now to the problem of making programs "year 2000-compatible" in order to avoid headaches when the time of reckoning draws near.

He rationalizes that most large firms maintain a library of thousands of Cobol programs, most of which have at least one date field. In addition, many of those programs have literals, sequence processes and error checks interspersed throughout, meaning that they will require modification in several places.

"You can't assume every date field has the word 'date' in it," Schoen said. "You also can't assume every field that looks like a date field is a date field. You're going to have to look at every program and figure it out."

For that reason, he said, the "black box" approach of simply running every program through a modification routine is impractical. Some date fields are bound to be missed.

See 2000 page 8

Manager gets 16-year jump on Cobol bug

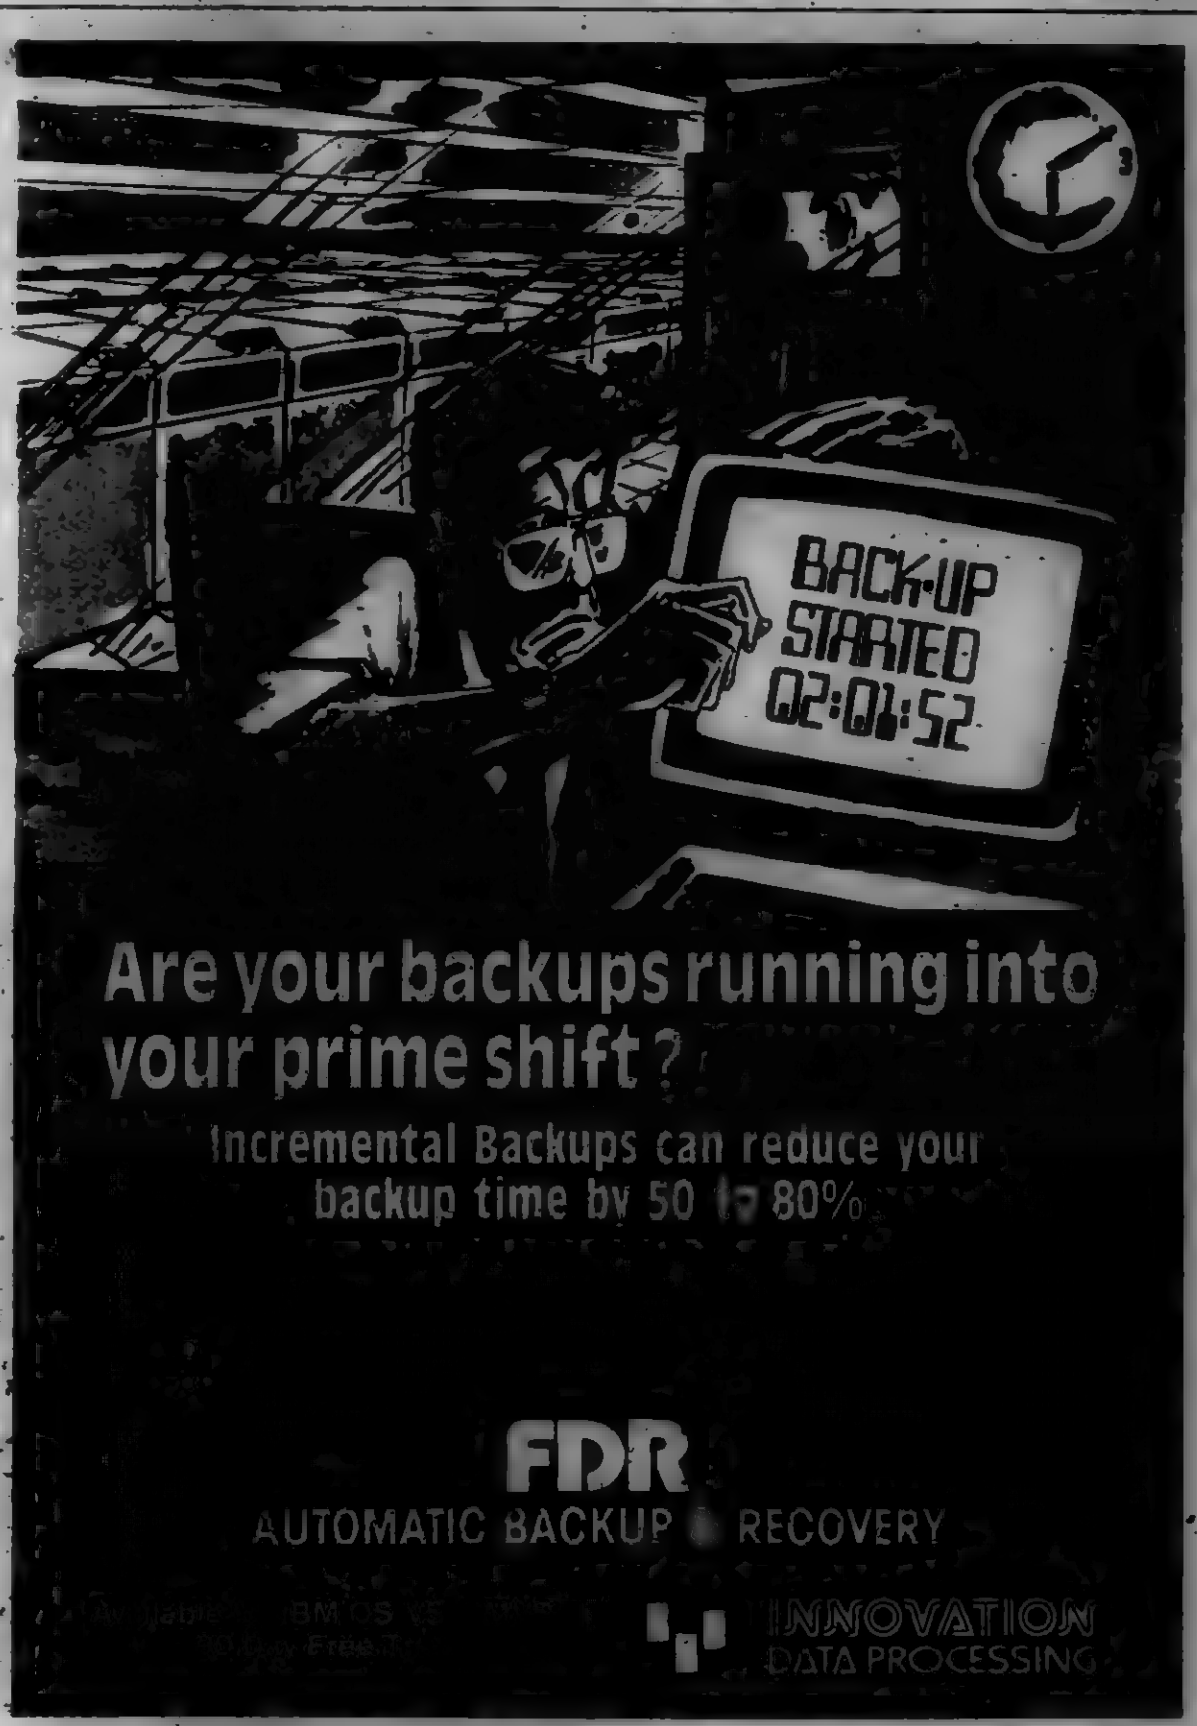
TOLEDO, Ohio — Although he agrees that making Cobol programs "year 2000-compatible" is not an issue of immediate concern, a DP manager here has elected to become the first user of a set of subroutines designed to make the transition to the new millennium a smooth one.

Michael Ehrick, director of computer services at Libbey-Owens-Ford, Inc., became interested in preparing Cobol programs for the inevitable march of time after he received a direct mail advertisement from William Schoen, a systems analyst based in Novi, Mich.

Schoen's Charmar Enterprises, Inc. markets a product that addresses the problems that may emerge when the year 2000 arrives and plays havoc with date fields in existing Cobol programs (see related story). His product is "a subroutine that does some elegant arithmetic routines that let you compare date fields with two-digit years in such a way that the year '00' is greater than the year '99,'" Ehrick said. Schoen also offers an approach to sorting so that the same end is achieved, according to Ehrick.

Ehrick put Schoen in contact with Libbey-Owens-Ford's manager of application development. The company expects to begin including the subroutine in new applications as soon as the next development project is undertaken.

The subroutines are "nothing an advanced computer science major couldn't do," Ehrick said. But, he added, "a lot of creative thought went into this, along with a lot of dogmatism."



New Zip+4 rules ease access to discounts

By John Gantner
CW Washington Bureau

WASHINGTON, D.C. — The U.S. Postal Service (USPS) has issued new regulations to make it easier for mass mailers to obtain discounts by using nine-digit Zip Codes. The post office hopes the regulations will greatly increase participation in the new postal automation program.

The Zip+4 program went into effect late last year after several years of controversy. However, the hoped-for success of the program, designed to bolster USPS productivity through greater automation, has been slow in developing, in part because mailers have had problems converting their address files to the longer Zip Codes.

The new regulations, published Jan. 31, should make it easier for firms to qualify for the one-half cent discount for every piece of mail that carries a Zip+4 code while phasing in full conversion to the new numbers, according to USPS and postal experts.

Postal regulations allow mailers to obtain a three cent discount for each piece of first-class mail delivered to a post office in bundles presorted by five-digit Zip Codes. Before the rules were modified, 100% of those letters had to carry a nine-digit code in order to qualify for the additional one-half cent discount.

But problems with the computerized Zip+4 data base tapes available from USPS and private sources have made it very difficult to convert all files to the Zip+4 program.

These difficulties have not deterred the USPS from expanding its use of new automated reading and sorting equipment needed for the Zip+4 program. At a recent USPS Board of Governors meeting, postal officials said the machines are reliably sorting approximately 50% of the mail they handle — far above the break-even point, they said. The board then approved the next phase of equipment procurements, totaling $450.2 million in machinery.

The new regulations . . . should make it easier for firms to qualify for the one-half cent discount for every piece of mail that carries a Zip+4 code while phasing in full conversion to the new numbers.

To prod more mailers to use the longer Zip Codes, the new postal regulations allow comingling of five- and nine-digit Zip Coded mail in presorted bundles of 500 letters. Only the letters with the nine-digit codes will qualify for the extra one-half cent discount but, on a temporary basis, mailers will not have to separate mail into the two presort categories.

By having to separate the two categories, mailers would have had to forfeit the three cent discount in order to qualify for a one-half cent discount, which understandably limited Zip+4 participation. Under the new rules, until Feb. 1, 1985, at least 85% of the pieces in the combined batches must have Zip+4 numbers. From then until Oct. 1, 1985, at least 90% must bear those numbers. Thereafter, no comingling will be allowed, and presorted five- and nine-digit Zip Coded mail must be bundled separately. Reacting to these changes, James E. Pehta, vice-president of List Processing Co., Lombard, Ill., said the rules will bring into the Zip+4 program many of the largest mailers, whose participation "is key to the success of the [Zip+4] program," but who have been "sitting on the fence" because of the problems they have had in qualifying for the discount.

Pehta, whose firm offers automated Zip Code services, is a member of the USPS Mailers Technical Advisory Committee, which represents private sector views to the agency and which helped to develop the new regulations.

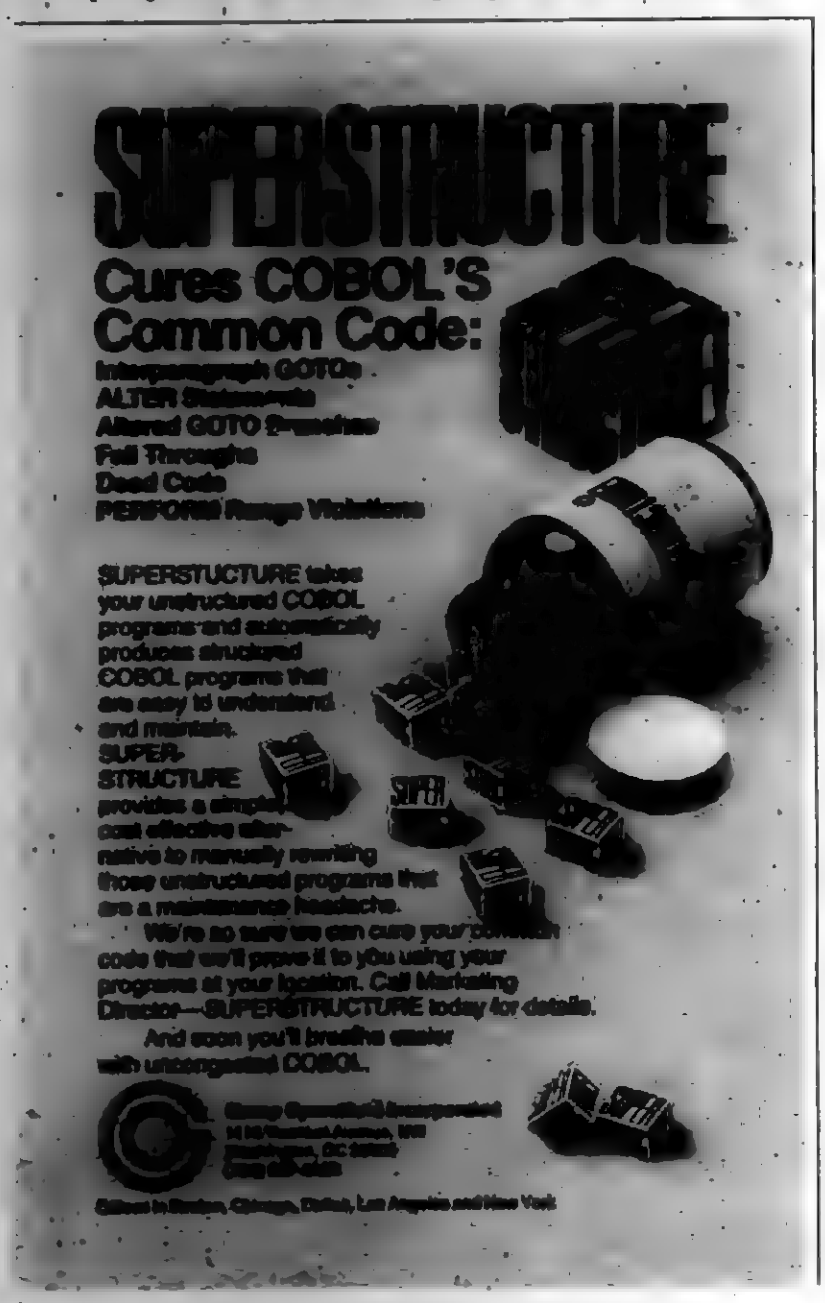
According to Pehta, of the 67 billion pieces of first-class mail delivered in fiscal 1983, 13 billion were presorted.

About 4,000 of the largest mailers in the U.S. produce approximately 40% of the mail, he added.

Pehta predicted that as a result of the new regulations, the amount of mail with nine-digit Zips might hit two billion pieces in the first year, up from an estimated 300 million that could have been expected without the more relaxed regulations.

He also noted that the new regulations contain provisions mailers must follow to certify that their mail meets requirements of the new rules. These will help the USPS track use of the Zip+4 numbers.

The USPS can use this statistical data to support requests for even larger Zip+4 discounts, according to Pehta, who said a three to five cent discount for machine-readable Zip+4 coded mail within four to five years is possible.



Burroughs releases laser printer

DETROIT — The North American release of the first laser printer for Burroughs Corp. mainframes was announced by the company last week. The B9290-30, a 30 page/min intelligent laser printing system that operates on-line with Burroughs systems, was first introduced in France seven months ago.

The B9290-30 is compatible with Burroughs B2900, B4900, B5900, B6900, B7900 and the recently released B9 mainframes. Running in a continuous print mode, the laser printer reportedly operates under both printer and host system software control.

Burroughs said the printer allows flexibility in the design of printed forms (printing logotypes and signatures), the placement of data on the forms and the assembly of completed reports. Images are created by a laser diode with a resolution of 57,600 dot/sq in.

The B9290-30 can print on two sides of uncoated, 8½- by 11-in. plain bond paper in either the portrait (standard text) or landscape (columnar) format with no loss of speed and completely collate and stack completed reports in distribution order, the vendor said.

The B9290-30 is priced at $65,000 from Burroughs, 1 Burroughs Place, Detroit, Mich. 48232.

2000 from page 7

The only real solution is to write all new programs to be year 2000-compatible.

Not surprisingly, Schoen has developed a method to do that. The Charmar Correction is a package consisting of two Cobol subroutines that can be inserted into new programs to resolve the problem. The $995 purchase price also includes an analysis of the problem and a methodology to deal with it.

Programs made to work

"They make programs work right, and they include directions to make sorts simple," he said.

Schoen has done some calculations to show why it makes sense to tackle the problem today. He figures it costs $300 to modify a program, and there is a minimum of 50 programs per programmer in the average corporate library. Assuming that half of those programs will need to be modified, that comes to a cost of $7,500 per programmer if the conversion is left until the last minute.

Based on scans of existing libraries, Schoen has decided that if firms begin implementing the changes now, by the year 2000 less than 2% of their programs will require modification. If they wait just six years to begin the process, the figure balloons to 25% to 30% of their library.

"Why should companies continue to write software that is not year 2000-compatible when it's just as easy to do it the right way now?" he reasons. Not many DP managers have bought his argument so far. He has been escorted out of buildings by security officers more than once, Schoen said.

Schoen's Charmar Enterprises can be reached through P.O. Box 702, Novi, Mich. 48050.

Recruiter says DP paychecks much fatter

Computing systems managers earning $41,500 to $66,800

By Peter Bartoli
CW Staff

MOUNTAIN VIEW, Calif. — Salaries in the computer profession are up sharply from six months ago, and there is an expansion in demand for various types of computer skills, according to a survey just released by Source EDP.

In its "1984 Computer Salary Survey and Career Planning Guide," the recruiting firm reported median compensation levels, along with high and low ranges, based on an analysis of more than 44,000 computer professionals who used the company's services during 1983.

"Salaries throughout the computer profession are on the rise, with most of the increase occurring during the last six months," the company reported. "In comparison with data available just six months ago, salaries are up sharply."

The report listed salary data for 11 nonmanagement positions at various levels of experience, four management positions at small, medium and large DP operations and three sales positions.

Changing technology

Changing technology is greatly impacting the hiring outlook for professionals in the DP industry, according to the report. "While it was once cost prohibitive for smaller companies, today, sophisticated computing power is being realized by even the smallest business establishment," according to Source EDP.

At the same time, "Large corporations are finding more uses for computing." The implications for career planning are twofold, according to the report: "Professionals in the user environment should broaden their exposure to such areas as distributed processing, end-user information center products, networking and communications in order to stay in the mainstream of career development."

Secondly, "new opportunities will develop in key disciplines within vendors of mini and microcomputers in the areas of software development, commercial and scientific systems development, programming, marketing and marketing support and within service organizations that support manufacturers' systems by providing time-sharing, turnkey applications, consulting services and more."

The report also said the career opportunities in the area of industrial automation may be the most exciting as the shift to automation, "only in its infancy," increases demand for computer-aided design and manufacturing systems designers and programmers and others.

Median salary ranges

Median salary ranges for managerial positions at small to large operations, Source EDP said, are: technical services managers, $40,800 to $54,900; systems and programming managers, $40,800 to $51,300; operations managers, $29,000 to $42,000; and computing systems managers, $41,500 to $66,800.

The highest median salary level for computer professionals in nonmanagerial positions and with two years' or less experience was $29,100 for systems programmers, closely followed by data communications programmers and programmer analysts at $28,800 and data base specialists at $28,400.

Other nonmanagerial positions with two years' or less experience were senior analysts, project leaders and consultants, $26,200; DP auditors, $25,500; software engineers, $25,300; mini/micro programmers and programmer analysts, $22,000; engineering/scientific programmers and programmer analysts, $21,100; commercial programmers and programmer analysts, $20,800; and computer operators, $15,000.

Median salaries for those positions with more than four years' experience (six years for software engineers and senior analysts) were data base specialists, $42,900; systems programmers, $41,500; senior analysts, $41,400; data communications programmers and programmer analysts, $40,700; DP auditors, $40,300; software engineers, $38,200; mini/micro programmers/analysts, $36,800; engineering/scientific programmers/analysts, $35,100; commercial programmers/analysts, $33,800; and computer operators, $23,700.

Median salaries for sales positions ranged from $25,000 for sales/technical support representatives with one to two years' experience to $55,300 for sales managers.

Source EDP's report is available free to computer professionals from Source EDP, Department DX-400, Box 7100, Mountain View, Calif. 94039.

Just published:

CICS for the COBOL Programmer Part 1: An Introductory Course

If you work with CICS...as a manager, a trainer, or a COBOL programmer...you should get a copy of *CICS for the COBOL Programmer, Part 1: An Introductory Course.*

Why? Because this new book zeroes in on the basics of CICS, leaving aside the features you won't use right away.

So beginners can use it to learn CICS without getting bogged down in a lot of detail. Experienced CICS programmers can use it to gain a better understanding of CICS that will help them produce more efficient programs. And everyone in your shop can use it as a reference manual to save time and coding errors.

Here's just some of what you'll find in this book:

- the meanings of the critical terms and concepts that apply to CICS
- how to use basic mapping support (BMS) macros to create a mapset...the special assembler program that defines screen formats for a CICS program
- 4 CICS terminal-handling commands that let COBOL programs communicate with 3270 terminals
- 5 CICS file-handling commands that let COBOL programs access VSAM key-sequenced (or ISAM) files
- 3 CICS program-control commands that let you transfer control from one COBOL program to another
- pseudo-conversational programming ...what it is, why you have to use it, and how it complicates the logic in a COBOL program
- why program efficiency is vital under CICS...and how to write programs that make the best use of your computer's resources
- how to design a *structured* CICS program
- how to test CICS programs using top-down testing
- how to debug CICS abends using either the Execution Diagnostics Facility (EDF) or a storage dump

4 reasons why this book works

1. To learn CICS programming, you have to grasp several complex concepts all at the same time. This book works because the author, Doug Lowe, carefully explains how each of these concepts relates to the whole.

In contrast, most courses present each CICS element separately, without showing relationships. No wonder so many people are baffled by CICS!

2. Doug spent a lot of time choosing a usable—and teachable—subset of CICS for this book. As a result, you won't learn *every* CICS feature...just the most useful ones. And you'll build a solid foundation for learning the additional CICS elements ...like alternate indexing, queue management, and terminal paging...that will be covered in *Part 2: An Advanced Course* (available late this year).

3. Doug gives you plenty of coding models in this book...for CICS elements, common COBOL routines, and BMS map definitions. I'm convinced these examples, more than any other factor, will help you understand how the new elements and routines work. And I know your productivity will go way up if you use these models when you write your own CICS programs.

4. Although effective program design is critical to the success of any programmer, I've yet to see a CICS course that deals adequately with the subject. In fact, most of them don't say anything about design at all.

In contrast, this book stresses effective, structured design. So you'll learn to break programs down into logical units that are easier to code, test, debug, and maintain.

Why wait? Get a copy TODAY

If you want to know more about how to develop CICS programs...or you need a practical, easy-to-use reference with plenty of examples...get *CICS for the COBOL Programmer, Part 1* TODAY. I think you'll be surprised at how much knowledge and reference material you can get for $25!

Our unlimited guarantee

You must be satisfied. Our books must work for you, or you can send them back for a full refund...no matter how many you buy, no matter how long you've had them.

To order, call 1-800-221-5528 / In California, call 1-800-221-5527 (8 to 4 Pacific Std. Time)

OR Mail the coupon below

Do you have some questions about VSAM file handling in COBOL?

If so, get a copy of *VSAM for the COBOL Programmer*. This practical, how-to guide will teach you all about using VSAM files in COBOL programs

That means you'll learn: the COBOL elements for handling key-sequenced, entry-sequenced, and relative-record VSAM files; why error processing is a must for VSAM files; how to use the IDCAMS utility; how to code the DOS or OS JCL for programs that use VSAM files; and more!

Little fear of DP glitches on 'Challenger'

IBM diagnoses 'Columbia' malfunctions to prevent recurrence

By Peter Bochnik
CW Staff

CAPE CANAVERAL, Fla. — Despite the many problems experienced last week during the mission of the space shuttle *Challenger*, there was little fear that the computer malfunctions experienced during *Columbia's* previous mission would recur.

At the end of *Columbia's* mission in December, two of the four IBM Advanced System/4 Pi Model AP-101 computers shut down [CW, Dec. 19]. When the firing of thrusters aboard *Columbia* jarred the ship, the No. 1 computer shut down, and its guidance and navigation tasks were assumed by the No. 2 computer. Five minutes later, after another thruster firing, the second computer also shut down. That computer was restarted, but failed again during the landing.

Following the flight, IBM removed the computers and stripped them down to pinpoint the problems. Both failures were believed to have been caused by objects floating around in circuit boards and causing electrical shorts. IBM implemented an additional testing procedure to ensure the problems would not occur in the future.

In the No. 2 computer, according to a spokesman for the National Aeronautics and Space Administration (Nasa), "a microscopically small solder ball loose in one of the circuits escaped detection in quality checks. In zero gravity it would drift over and short out the circuits."

In the No. 1 computer that could not be restarted, "a small flake of gold-plated carbon, scrap from the circuit board, jammed into circuits and caused a permanent short."

Joseph Melitano, spokesman for IBM's Space Shuttle Program, said the causes were "identified with a high degree of certainty," but not 100% certainty because during attempts to recreate the failures, the computers "did not re-abort out."

Nasa spokesman Terry White said, prior to *Challenger's* launch, that there was little concern about a recurrence during the latest mission, even though *Challenger's* computers were not stripped down, because the computers aboard that shuttle "have flown on three previous flights with no problem at all." Melitano said the *Challenger* computers were subjected to standard tests.

According to Melitano, IBM has initiated additional testing procedures called particle impact noise detection (Pind). A "highly sensitive audiovisual system is placed against the computer, which is given a jolt to see if the [Pind] system can pick up any movement," he explained. "If [engineers] hear any noise, they'll take the component apart or even take the computer away."

During the Pind test, the computer components are vibrated and then shocked to determine if any objects are loose within them.

Equipment designed for use in space is designed to exacting military specifications and subjected to rigorous testing that has no comparison in the production of commercial equipment, Melitano said. "The equipment is built and tested to withstand the shock of lift-off and the heat of reentry and to operate in a weightless environment. Redundancy is the key ingredient. All these systems are designed to take the impact of any number of failures."

The space shuttle 'Challenger'

Ifip schedules security meet

TORONTO — The International Federation for Information Processing (Ifip) has scheduled its second International Congress and Exhibition on Computer Security Sept. 10-12 here.

The theme of the congress will be "Computer Security — a Global Challenge." Sessions will cover computer security, contingency planning, data and facility protection and implications of systems security.

Registration costs $442 prior to May 30, $479 prior to July 30, $516 before Sept. 1 and $553 for late registration from the International Security Congress, Inc., 160 Duncan Mill Road, Don Mills, Ont., Canada M3B1Z5.

Failed orbit sinks use of $75 million satellites

By Lynn Weiner
CW Staff

CAPE CANAVERAL, Fla. — Two $75 million communications satellites launched by the space shuttle *Challenger* failed to achieve orbit, rendering them useless as transmitters of voice, data, video and facsimile traffic.

Launched on Friday, Feb. 3, from *Challenger's* cargo bay, the *Westar VI* communications satellite, owned by the Western Union Co. of Upper Saddle River, N.J., ran into problems "some time late that afternoon," according to a spokesman from Western Union.

The second satellite, the *Palapa B-2*, owned by the government of Indonesia, failed to achieve proper orbit after it was launched last Monday, Feb. 6.

Both satellites were built by Hughes Aircraft Co. and were to be boosted into high Earth orbit by a payload assist module made by McDonnell Douglas Corp. Each satellite was insured for about $100 million.

According to a National Aeronautics and Space Administration (Nasa) spokesman, a malfunctioning booster rocket may have affected the proper positioning of the satellites. The *Westar VI* was supposed to have reached geosynchronous orbit — the point in space where the orbit of the satellite matches the rotational speed of the Earth — at an altitude of 22,300 miles.

The launching of the *Westar VI* was to have marked Western Union's first decade in space and the 10th anniversary of the first launch of a U.S. domestic communications satellite. The initial launch took place in April 1974. Western Union currently has four domestic communications satellites in space, the *Westar II, III, IV* and *V*.

The *Westar VI* was a 24-transponder C-band satellite, similar to *Westar IV* and *V*. As a future customer of *Westar VI* services, Vitalink Communications Corp., a three-year-old company partially owned by Western Union and General Electric Co., had purchased two of the transponders. Vitalink was "well insured" for the loss, a Vitalink spokeswoman said.

Vitalink currently leases two transponders on *Westar IV* and intended to move its customers from *IV* to *VI*. "In terms of Vitalink's operation, our customers will feel absolutely no interruption in service," the spokeswoman said. "We plan to extend our leases on *Westar IV*, and with our coverage for the space we owned on the *VI*, we will be pursuing the lease or purchase of new transponder space."

The spokesman for Western Union confirmed "business as usual" for customers on the existing four satellites. Some of the print media customers, which use the satellites to transmit facsimile communications traffic to their various regional printing plants from which local distribution takes over, include the *Wall Street Journal, U.S. News and World Report, Time, Sports Illustrated* and *People Magazine*.

According to a Western Union spokesman, the firm will explore ways to utilize its integrated satellite and terrestrial microwave network to handle the communications traffic slated for *Westar VI*. The firm is also exploring the possibility of leasing capacity from other carriers.

Construction and planning for *Westar VII* are already under way, with a projected launch date for fall 1985.

Because of the *Westar VI* launch failure, Western Union will attempt to move that date up, the spokesman said.

Will mishap hike insurance rates?

NEW YORK — The insurance industry is feeling repercussions from the failures to properly launch two $75 million communications satellites from the space shuttle *Challenger* this month.

The *Westar VI* communications satellite owned by Western Union Co. was insured for $105 million; Western Union had paid a premium of about $5.5 million for the policy. Alexander & Alexander Services, Inc., a New York brokerage company, was the underwriter for the policy, according to a Western Union spokesman.

The anticipated increase in the use of communications satellites and, therefore, the increased likelihood that other launches could go awry may elevate the cost of insuring such ventures, according to insurance industry experts.

The Western Union spokesman refused to speculate on how an increase in insurance rates would affect satellite customers. "I'd say it's premature to say what effect increases in insurance costs will have for us. This is a situation where we're just going to have to wait and see what happens in the future."

YOUR PHONE BILL.

If you're running 212 modems in a dial-up network, Codex has a new product that can significantly reduce your phone bills.

It's the Codex 224 modem.

At 1200 bits per second, the Codex 224 is fully compatible with Bell's 212 modem. But because the Codex 224 also runs at 2400 bits per second you can transfer more data faster and therein lies the economy.

You can run at 2400 bps full duplex asynchronous or synchronous over public telephone lines, even unattended. And because the Codex 224 incorporates advanced equalizers you're assured of high performance at higher speeds even over marginal lines. In addition, the Codex 224 automatically recognizes 1200 or 2400 bps transmissions and adjusts automatically.

And with faster file transfer and screen fills, people in the network will be able to get more done in the same time.

What all this means is that you can get better productivity and significant savings in your 212 network simply by installing Codex 224 modems.

The Codex 224, which meets the CCITT international standard, can be leased directly from Codex or purchased outright.

In short, you don't have to make a massive investment to run a better, faster, more economical network.

All you have to do is call Codex.

Call 1-800-821-7700 Ext. 895. Or write: Codex Corporation, Dept. 707-95, 20 Cabot Blvd., Mansfield, MA 02048.

Air Force launches Sperry pact

CW photo by J. Connolly

Air Force Staff Sgt. Lawrence Thompson operates Sperry 1100/60 at Langley Air Force Base.

By James Connolly
CW Staff

HAMPTON, Va. — Installed under the largest commercial computer contract in history, a Sperry Corp. 1100/60 mainframe here at Langley Air Force Base last week became the first of 153 new U.S. Air Force computers to be fully operational.

The Langley system, like other Phase IV Program systems that will be installed at 118 air bases throughout the world, will manage base-level administrative tasks such as supply, maintenance, accounting, property inventory and personnel. The systems at the other bases are at various stages of installation, but Defense Department and Sperry officials said that all of the $480 million contract's 153 systems, which include regionalized primary systems and backups in some areas, will be operational by the July 1, 1985 target date.

Assistant Secretary of the Air Force Russell D. Hale, Sperry Corp. Computer Systems President Joseph J. Kroger and Gen. W.L. Creech, commander of the Tactical Air Command, headquartered here, officially opened the Langley computer room last week.

At Langley, chosen for the first installation because the Air Force felt it was typical of large air bases, the 1100/60 is located on the first floor of a three-story red-brick building. But throughout the 400-acre base are some 400 Sperry UTS-40 terminals and printer-terminals linked to the mainframe.

Those terminals will be used by personnel in various departments and air wings to order supplies, keep maintenance records on aircraft and handle other administrative tasks.

"With this system," Hale said, "supply people for once in their lives are going to be able to understand their roles, how they fit in." It is the Air Force's first true distributed data processing, he added.

Hale stressed that it is crucial for the Air Force to be able to manage spare parts and maintain its aircraft and that base-level supply is more important to the Air Force than to other services because only the Air Force fights from its home bases.

Hale cited the fact that the Air Force uses 57 different types of aircraft engines as an example of the supply problem's complexity. The computers will be used to track the thousands of spare parts needed. They will also track fuel supplies, munitions and ground vehicles.

In addition, the processors will maintain personnel, medical and payroll records for more than 10,000 military and 1,200 civilian employees at Langley.

The base is home for the 48th Fighter Interceptor Squadron and various airlift, communications, training and support groups, both active and reserve.

Nineteen configurations

The 1100/60, which will be installed in 19 different configurations at the different bases, replaces a combination of Burroughs Corp. 3500 and Sperry 1050 mainframes purchased in the 1960s. Those 277 systems are scheduled to be replaced by an average of about 10 of the 1100/60s per month.

Implementation of the Phase IV Program involves converting 320 software systems that are unique to the Air Force and hundreds of other programs that are unique to individual bases or commands.

Sperry won the eight-year contract a year ago after a head-to-head "compute-off" that pitted Sperry against Burroughs in a 26-month contest to determine which company and system could best convert 1.5 million lines of Air Force software at the lowest price. The contract could soar to more than $1 billion by the year 2002 if Sperry wins two six-year extensions, which Hale noted could involve major upgrades in the systems.

"This system is upward growth-compatible. If Sperry comes out with a new whatever, we can integrate it into our system. It's a system for the 1990s," he said. In addition to the 153 mainframes, the contract calls for Sperry to supply 7,000 terminals by July 1985 and a total of 20,000 terminals by the end of the contract.

In addition to the Air Force contract, Sperry's defense contracts include three pacts, worth more than $1.5 billion, to supply computers to the U.S. Navy and a $1 billion contract to provide electronics and weapons for six Canadian frigates.

VIDEOTEX IS NOW!

Enjoy the advantages of information services through videotex . . . now.

Comparatively low in cost and truly user friendly, videotex meets the ever-growing needs for the two-way exchange and distribution of information. Using color and powerful graphics, videotex offers tools and techniques difficult to attain through traditional data processing methods.

Using a TV set as a terminal, videotex provides effective internal information services, handles electronic messaging, or links to other computer-based information sources.

Videotex systems available from Videotex America are easy to install, simple to operate and provide access by users in a very simplistic manner.

Videotex is part of the very cutting edge of the information revolution, and now is the time to determine what role this exciting new technology will play in your company's future. Videotex is new . . . and Videotex America can show you how to make the most of it.

VIDEOTEX AMERICA

For more information, write to: Hugh Wagner, Vice President, Marketing, Videotex America, 2375 Morse Ave., Irvine, CA 92714

DEC chief promises drastic price reductions

By David Myers
CW New York Bureau

NEW YORK — Buyers of Digital Equipment Corp. systems can look forward to "drastic" price reductions over the next year and a half, according to Kenneth H. Olsen, president and founder of what is now the second largest computer maker in the U.S.

Addressing stock market analysts here last week, Olsen said the overall cost of a computer system will not drop as steeply as the price of its central processing unit. However, the price drop-offs will be the steepest in DEC's 26 years of business.

"We never use the word 'price cutting.' We like to think we're the ones who introduce new technologies and new low prices," Olsen said when asked if DEC would lead prices downward for the rest of the computer industry. He added, however, that as "the cost of computing is coming down, people's taste for computing is on the rise. That's the compensating factor."

Olsen also told the analysts that DEC has recovered from its disastrous first quarter, when profits crashed by 72%. Second-quarter results, released a week before Olsen faced Wall Street, showed DEC's profits climbing once more, up 32% over the year-ago quarter.

The quick turnaround was caused by an internal change in the method of measuring sales success. "The change was insignificant," according to Olsen. "All we said is, 'We're going to measure you differently — by sales department rather than by product line.' "

The internal change also explained the management defections DEC suffered in the first quarter, Olsen said. "It made a few people who had been doing it the old way for 23 years unhappy. [Their leaving] really had little to do with what we went through in quarter one."

Not all analysts convinced

But not all analysts were convinced. Frederic H. Cohen of L. F. Rothschild, Unterberg, Towbin said recent top-flight emigres from DEC's engineering ranks had "not been replaced by equivalent people. Key people have a [financial] stake in [Data General Corp.] and have a reason to stay. That's not true at DEC. Why would the flow of people to other companies not continue?"

However, John J. McManus, an analyst at Bear, Stearns & Co., said DEC, "like IBM," is "ripe for the raiding. There are always going to be people leaving. We can't lose sight of their tremendous market share."

Olsen complained that critics of DEC had jumped all over the company after its first-quarter results were posted. "We should not be measured by our participation in the fast-growth, sometimes fast-decline segments of the industry," the DEC chief said.

"We have dull customers with dull applications, as opposed to robots and home computers and the like. But we like that market. It's challenging, but it's stable," he said.

In discussing product strategy, Olsen divided DEC's plans into three parts for the stock analysts:

■ DEC will continue to "concentrate on VAX," including the eventual appearance of "Venus," the high-end machine now five years in development. In addition, the two-board Microvax I is due to appear later this year with the single-chip Microvax II to follow in 1985.

Olsen

■ DEC will continue to "tie all our customers together through clustering," either "on the disk side" or through Xerox Corp.'s Ethernet network. All DEC equipment is now compatible, Olsen said, with some links to IBM and Wang Laboratories, Inc. hardware also having been forged.

■ Personal computers will continue to play "a large part in our systems," Olsen said. "The work will be highly shared between personal computers and the VAX." However, he noted that it will be "a long time before [the personal computer market] settles down."

Olsen also revealed that a "medium-size project" now under way at DEC is developing a "simple computer that goes very fast" and which is based on "a completely different architecture" than the rest of the Maynard, Mass.-based computer maker's line.

"All the uses for this we're not sure of yet," Olsen said, vowing the new machine would not become the company's "main line."

Olsen said the biggest problem faced by the No. 2 computer vendor is deciding which markets to remain a competitor in and which to abandon.

"Most of the challenges are our own. We believe it's too easy to blame your problems on the government — that's a good Puritan tradition," Olsen said.

Cut Information Retrieval Down To Size

...with BRS/SEARCH— the Software That Comes In Mainframe, Micro and Mini Sizes.

BRS/SEARCH, the same information retrieval software that runs one of the world's largest online database systems is now available for your mainframe, mini, or micro computer.

BRS/SEARCH gives you instant access to all your own information, regardless of its length or format. Many powerful, easy-to-use features developed through millions of online searches have made BRS/SEARCH the system of choice among information professionals.

BRS/SEARCH runs on IBM and compatible mainframes, as well as 16 and 32 bit mini and micro computers. And because the search query language is the same no matter what size computer, you can use it on a variety of systems without any additional training.

For more information about these three new sizes of database software, call (800) 235-1209. Or write BRS Software Sales Support, 1200 Rte. 7, Latham, N.Y. 12110.

Dealer and OEM inquiries invited.

Bank's quality assurer has lofty goals

By Bill Laberis
CW Staff

BOSTON — Karen Jacobs said she was typical of a lot of young people during the 1960s, shunning any sort of goal orientation in favor of simply putting in her eight hours and going home.

But today, after 22 years with the same company, Jacobs' professional world is almost entirely goal-oriented. As quality assurance coordinator at the Shawmut Bank here, the 39-year-old Jacobs oversees a reporting system designed to ensure that the bank's DP shop meets service goals the shop helps develop, while ensuring further that users get what they need from the DP shop — no more, no less.

Trained initially as a clerk/typist and later as a budget specialist, Jacobs spent nearly 11 years in Shawmut's data center in various clerical and administrative capacities before moving up to quality assurance five years ago. Her move coincided with the bank's implementation of a performance appraisal system set up to monitor DP performance and productivity.

"I'm the liaison between EDP and the users, via the reporting system," Jacobs said in a recent interview. "The idea from the beginning was to open communication between EDP and the user. I think in the last few years here we've helped break down a common misconception that EDP people are untouchable."

Photo by P. Kaczanowski
Karen Jacobs

To accomplish such lofty goals as DP-user harmony, Jacobs said she first had to hone her own communication skills before applying them to two groups of people who in many shops mix about as well as oil and water.

"It helps to be a good organizer and to know the resources available to you when it comes to resolving a minor conflict before it becomes a major blowout," she said. "You have to be both firm and friendly, but most of all you have to be fair. It all sounds so simple until you try to practice on live subjects."

Jacobs gets plenty of opportunities to practice these days. She works with and monitors the performance of 43 applications serving dozens of users at the bank. Using the framework of a performance rating system developed by Darien, Conn.- based Mathews & Co. management consultants, Jacobs helps the users and DPers develop mutually acceptable levels of performance for the DP shop by drafting a written agreement signed by managers from both the user and DP communities.

Once the agreement is reached, it remains unchanged unless changes are again mutually agreed upon. For example, Jacobs used the Mathews system to help users develop performance measurements for Shawmut's demand deposit application, one of the bank's largest applications. She first gathered job control and human resource data from the computer control and scheduling people to determine what reports the application routinely generated and to whom they were sent and when.

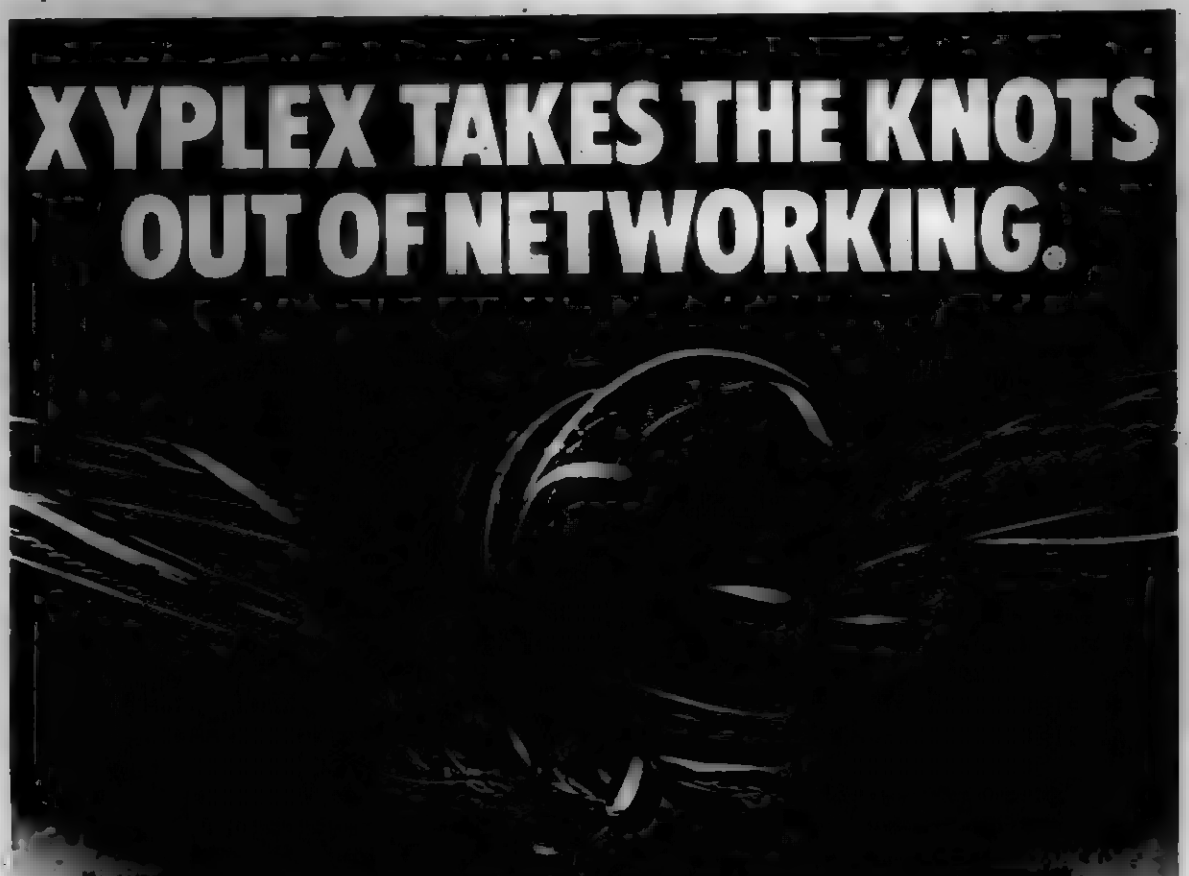
Combining this information with data from the users, Jacobs then arranged a series of meetings with the two groups to work out definitive job schedules. The binding agreement that was finally hammered out dictates what users can expect and what DP should produce. She was also able to alert some users to the availability of reports of which they were not aware.

"Prior to implementing the system, some users needed their reports at 8 a.m.," Jacobs recalled. "Well, maybe they did and maybe they didn't. Using the system with our department in the middle, we have been better able to allow supervisors and middle managers among the users to determine needs vs. wants."

Jacobs said she maintains continuous contact with users, who rate the DP shop according to several criteria, including accuracy of reports, timeliness, on-line availability and response time. Each of the criteria has standards of performance attached to it. For example, to get a "highly satisfactory" rating for timeliness, the DP shop must have zero days of late output in one month, or one day for a "good" rating.

Apart from the enhanced cooperation between users and DP, Jacobs said the performance rating system has also given greater visibility to problems for senior management. In addition, the constant run of meetings Jacobs chairs often stimulates conversation about problems other than those immediately at hand.

"I stayed in the data center, mainly as a clerk, because I truly liked that part of the banking business," Jacobs said. "Now with this job, I feel I have gained back more in the last year in terms of professional development than I have in my lifetime."



If your
– and tog
VAX-11* or PDP-11* user.
Featuring state-of-the-art technology, the XYPLEX System untangles the complexity that bogs down other integrated data communication systems.

A single coaxial cable will never tie you up.
Using XYPLEX locally, a single common cable can extend up to 32,000 feet and connect over 1,500 terminals . . . and personal computers with over 50 computer systems. Because you use less cable, your computer gains more space for more important data processing tasks at a much lower cost.

"Smart" hardware and software connections give your computer more free time.
With an intelligent microprocessor-based terminal cluster controller and a front-end host interface unit handling nearly all terminal and printer processing, your computer has more time to execute your specific business applications. And since character processing is also unloaded from the host, your terminals can run at their top speed.

So if you're a VAX-11 or PDP-11 user and networking isn't working out the way you'd planned, tie-into the XYPLEX System and see how easy and economical distributed data processing can be.

Coping with AT&T split

Realign tech resource management: report

By James Connolly
CW Staff

BOULDER, Colo. — Budgeting an extra 10% for telephone service, studying bypass technologies and finding new means of managing the electronic office are ways for firms to cope with the AT&T divestiture and technological advances, suggested a report published last week by Cross Information Co., a consulting firm based here.

Corporations should not only plan for additional costs and personnel for telecommunications, but they also should examine how they manage all of their communications, computer and other technical resources, the report advised.

Cross recommended that financial modeling software be used to project changes in telephone rates and calling patterns; that companies appoint staff members to assume the responsibility of the AT&T network account manager; that managers budget a 10% increase in telephone rates and a 30% staff increase; and that companies save repair costs by using their own personnel to find technical problems.

The report called for companies to examine bypass technologies and outlined the strengths and weaknesses of cable television and the microwave, cellular and satellite communications industries as alternatives to AT&T and the regional telephone holding companies.

Another vote for Unix

Cross also suggested that companies convert all of their computer systems to AT&T's Unix multiuser system. "We believe Unix will become the world's computer operating system," the report said.

Corporations should not only plan for additional costs and personnel for telecommunications, but they also should examine how they manage all of their . . . technical resources.

A key to dealing with the rapid changes in technology and communications, according to Cross, is what the report called "virtual management." Under that system, managers use sales and marketing techniques within their own organizations to work with employees to integrate all aspects of the electronic office, including voice and data communications, computers, robots, biotechnology, energy management and ergonomics.

The report predicted government indifference to higher rates after the 1984 elections; delays in getting new products and services because of state and federal regulatory "logjams"; and AT&T and IBM pushing most small suppliers or new products and services from the marketplace.

It also foresaw additional features keeping private branch exchange prices from going down; AT&T continuing a long-range migration strategy of overpricing old equipment to steer customers to new products; poorer and more expensive service in rural areas; and cities raising taxes to fund telephone service for the poor and elderly.

The study recommended that companies prepare for delays in specialized services, with a three- to six-month delay in getting leased lines and repairs — once taking hours — taking weeks.

The 400-page report is available for $500 from Cross, a four-year-old consulting company specializing in telecommunications, located in Suite B, 934 Pearl St., Boulder, Colo. 80302.

Study looks at how AT&T can profit from services

BOULDER, Colo. — AT&T can profit from its long-distance service, new products and joint ventures — but not until it completes its reorganization and develops a marketing strategy, according to a study by Cross Information Co.

In examining the competition among AT&T, the seven former Bell operating companies and alternative communications industries, the consulting firm concluded that AT&T Technologies will continue to market new products, enter joint ventures in the U.S. and abroad and make its Unix multiuser system the "operating standard," thus "positioning itself to compete with IBM."

The report said that the Bell holding companies may see competition in heavily populated local calling areas, but that some lack the proven sales staffs and strategies to compete in markets such as private branch exchanges and long distance. According to Cross, the seven have one thing in common: the buying power of their "enormous resources," even after the parent company's breakup.

Cross noted that AT&T Communications remains viable in the long-distance market despite facing post-divestiture government regulation, such as the Federal Communications Commission allowing a $6 access fee for corporate phone lines while delaying access fees for small businesses and residences.

Long-distance competitors, such as MCI Communications Corp., will benefit when the holding companies later this year begin providing the competitors with the same access to trunk lines that AT&T enjoys, the report noted.

But that does not ensure success, according to Cross, which noted that other common carriers and specialized common carriers do not have the financial backing or technological breakthroughs to defeat AT&T. However, they do have innovative marketing techniques, the report said.

At the local, "last mile" level, the report listed cable television companies, local-area networks and cellular companies as competitors to the holding companies.

The cable firms lack penetration in the business district, understanding of DP and networking capabilities. But they can offer telephone directories, alarm services, electronic mail and other information services, the report noted.

Xpediter users to meet

SAN JOSE, Calif. — The national Xpediter Users Group Conference will be held Feb. 27-29 at the Sheraton-Fisherman's Wharf here.

Featured guest speakers will be Ned Chapin, chief consultant with Infosci, Inc. of Menlo Park, Calif., and Dr. Ed Miller, technical director with Software Research Associates of San Francisco.

Xpediter is an automated testing and debugging tool used by Cobol programmers for applications ranging from program development to program maintenance.

Delegates from the host company, Application Development Systems, Inc. (ADS) here, and from the user community will discuss a variety of topics, including Xpediter testing techniques and future product developments.

The registration cost is $150 for the first registrant and $125 for each additional registrant per company.

More information is available from ADS, 1530 Meridian Ave., San Jose, Calif. 95125.

Local-area net seminar set

ARLINGTON, Va. — A seminar on local-area networks will be held at the Marriott Crystal Gateway Hotel here March 12-13 by Phillips Publishing, Inc. and Century Planning Associates, Inc.

The seminar will be led by Joseph Nocerino, president of Century Planning. Speakers will include Lee Afflerbach of Columbia Telecommunications, William Herald of Planning Research Corp. and Philip Walcoff of RJO Enterprises, Inc.

The fee for the seminar is $595.

Registration information is available from Phillips Publishing, Suite 1200N, 7315 Wisconsin Ave., Bethesda, Md. 20814.

In the words of our users.

"Service has been excellent, and the new operating system is as powerful as they said it would be."

Calif. lawmakers offer bill to stem hacking

By Jeffry Beeler
CW West Coast Bureau

SACRAMENTO, Calif. — A group of California lawmakers has proposed a legislative remedy to the recent rash of information systems break-ins by teenage hackers and other high-tech vandals.

On Jan. 31, a bipartisan coalition of state assemblymen and senators introduced a bill that would refine California's definition of computer crime to give law enforcement officials increased leeway in prosecuting illicit systems users. If Assembly Bill 2551 passes, state law for the first time would explicitly distinguish between unauthorized systems accesses that are deliberately destructive and other such breaches, in which damage is nonexistent or clearly accidental.

Under the state's existing computer crime law, which took effect about four years ago, an unauthorized systems entry qualifies as illegal only if it results in "malicious" destruction or alteration of hardware, programs or data. The statute classifies all such crimes as felonies and makes no provision for system violations in which malice is absent or unproven.

A.B. 2551, by contrast, divides systems penetrations into two categories and treats each differently. One of the classifications is for felonies, which include any illicit access that ends in knowing or malicious systems tampering.

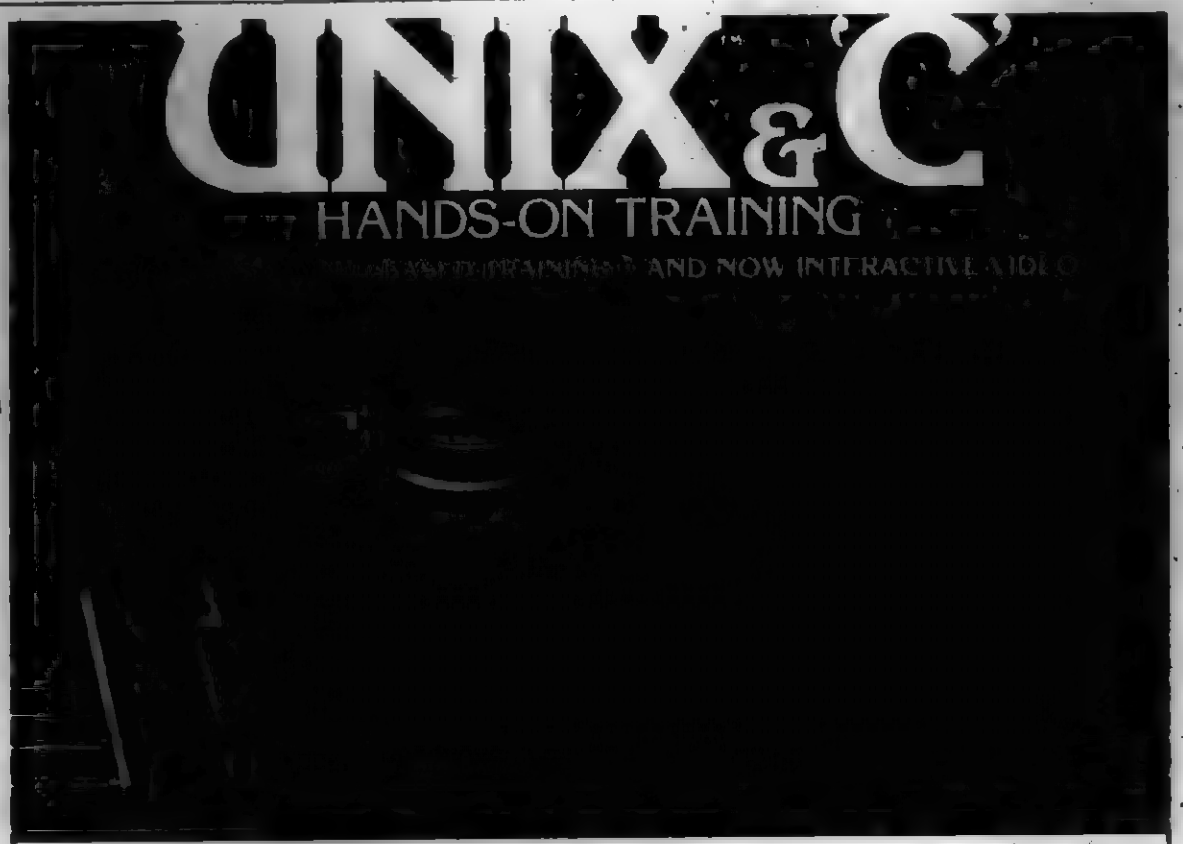
The other covers misdemeanors, which would apply to users who simply gain unauthorized access to a system, but who plainly intend to do no damage.

If it becomes law, A.B. 2551 would give state authorities "additional flexibility" in charging unwanted systems users with computer crimes, according to Barbara Lloyd, a legislative consultant to Assemblyman Sam Farr (D-Santa Cruz), one of the bill's coauthors. "Today, officials have only a limited range of options. They either have to try to convict violators of a felony, prosecute them on some other kind of offense that has absolutely nothing to do with computers or let them go entirely," Lloyd noted.

But in systems break-ins where the injury is slight or nonexistent, "law enforcement officials may not feel the need to seek a felony conviction because the penalties would be inappropriate to the offense," Lloyd said. "On the other hand, authorities don't want to create the impression that [hackers] can enjoy free rein over other people's systems as long as they don't plan on destroying them. So the state needs a law like A.B. 2551, which would give officials a middle ground between charging violators with a felony and not charging them at all."

The bill would also "send a real clear message" to potential snoopers who think certain kinds of unauthorized systems accesses are exempt from criminal prosecution and penalties, she added.

Although the proposed legislation has received broad, bipartisan support from state lawmakers, representatives of certain special interest groups have expressed concern that the bill might unintentionally discourage legitimate use of electronic bulletin boards. Lloyd professes to understand the misgivings, but voices confidence that A.B. 2551 could be easily amended to address the concerns.



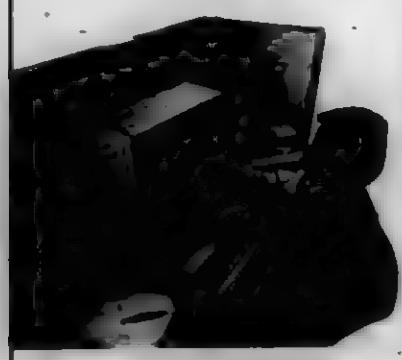
Select your training medium according to the type of training you prefer and the number of people to be trained.

VIDEO-BASED TRAINING. The Computer Technology Group's Video-Based Training integrates professionally developed and produced video and text material, as well as hands-on exercises, into complete training programs.

Our courses are produced with the highest standards of video quality, applying the latest techniques of instructional design including the use of computer graphics and animation techniques to compress learning time. The students' time is not wasted with the "camera at the back of the classroom" or "chalk talk" approach which is so inefficient, and often ineffective, in transferring skills.

Our Video-Based Training courses are completely self-contained, including the hardware-independent hands-on exercises. All you need is a video cassette player.

COURSE	Number of Modules: Video-Based	Interactive
Computers at Work	15	
UNIX—An Executive Perspective	1	
UNIX Overview	6	6
UNIX Fundamentals	15	15
"C" Language Programming	16	16



INTERACTIVE VIDEODISC TRAINING. Our new UNIX Videodisc Training Curriculum combines the benefits of our Video-Based Training with the flexibility of microcomputer access. Designed as a one-on-one tutor, our interactive system assesses the training needs of each student and dynamically tailors the training to his/her specific needs, thus eliminating redundant training. Through engaging exercises and interactive video, we are able to increase student comprehension while reducing training time.

Developed by the Computer Technology Group and Interactive Training Systems, the curriculum uses the latest laser videodisc technology—including IBM PC, color monitor and Interactive Training System Controller.

PUBLIC AND IN-HOUSE SEMINARS. Both public and in-house seminars are offered on a wide variety of UNIX and "C" Language subjects, including:

UNIX Overview • UNIX Fundamentals for Non-Programmers • UNIX Fundamentals for Programmers • Shell as a Command Language • "C" Language Programming • Shell Programming • Using Advanced UNIX Commands • UNIX Internals • UNIX Administration • Advanced "C" Programming Workshop • Advanced "C" Programming Under UNIX • Berkeley UNIX Fundamentals and "csh" Shell.

Lotus files copyright suit against Rixon

BOSTON — Lotus Development Corp. filed a $10 million lawsuit in U.S. District Court here last Tuesday charging Rixon, Inc. with illegally copying and disseminating Lotus' 1-2-3 software package. Rixon, the Silver Spring, Md., modem manufacturer, is a subsidiary of Sangamo Weston, Inc.

"The $10 million is an estimate for the number of illegal copies that Rixon made," said Eric Deutsch, associate attorney for the Boston law firm of Testa Hurwitz & Thibeault, which represents Lotus. "A plaintiff can charge $50,000 for each infringement of a copyrighted material." That means Lotus is estimating that 200 copies of 1-2-3 were made.

"We know of at least 10 illegally produced copies of the product," Deutsch said.

Rixon was allegedly reproducing user manuals as well as program diskettes and using them in its branch offices throughout the U.S. "Lotus learned of the practice from a Rixon employee," Deutsch said. There is a possibility that the case will be settled before it reaches trial. "There have been discussions between Rixon's counsel and us," Deutsch admitted.

Rixon officials were not available for comment.

While data base gurus have come and gone, Thomas M. Nies, president of Cincom Systems, Inc., has remained one of the industry's most respected spokesmen. In the early 1970s, he predicted the arrival of the "data base decade." That statement has proved prophetic, as measured by sales of Cincom's Total data base management system (DBMS). With more than 6,000 installations, Total is by far the most popular DBMS from an independent vendor. In 1979, Nies proclaimed that "data base, per se, was passe." The statement surprised the software industry, but it, too, has been borne out by the recent rush of data base vendors to expand into other markets. Cincom has been diversifying as well, expanding first into manufacturing applications and more recently into decision support and financial software. However, DBMS has remained the core of its product strategy. Nies was interviewed recently at Cincom's Cincinnati headquarters by Computerworld Senior Editor/Software Paul Gillin.

Cincom chief forecasts data base directions

Says programming will be automated

In 1979, you said that data base, per se, was passe. How has that statement been realized, and what does that mean to the data base industry today?

Data base management systems [DBMS] technology has become one of the great delimiters of what can be accomplished. The nature of the data structures, the ability to handle complex transactions, the ability to support end users — all of these things have put additional pressures on DBMS since the '60s and the '70s. Old-style DBMS products that were prominent in the '70s are not satisfactory for the completely unstructured end-user systems of the future.

The second part of that comment is, the framework within which that data base management engine fits must be completely changed. In the '60s and '70s, the idea was that the professional programmer would be knowledgeable of data structures, data storage mechanisms, data management commands and so on. This created a demand for knowledge which became the bottleneck for progress. Those old tools are no longer necessary, so we have to supplement the DBMS with other software which, in effect, automatically does large amounts of the work professional programmers would have done before.

What other trends in data base will drive the market for the rest of this decade?

The first trend is this more comprehensive approach, so that everything is done much more easily and to a much higher quality level. I'm talking five to 10 times productivity improvements in using data.

The second major trend is the movement of the data base capability away from only the province of the mainframe. We should supplement the mainframe with a set of superminis and other ancillary computers to serve specialized needs. But all of those computers need data, and that data should be organized in the data base approach.

A major part of Cincom Systems, Inc.'s product line has been tools that complement the data base, including fourth-generation languages and application development systems. Yet these tools are still being used on rather specialized tasks. What is needed for them to catch on?

The failure to catch on has been a result of the weakness of the products themselves. The problem with these languages is that they're not strong enough to encompass the entire gamut of need of Cobol. Therefore, they have to be used in specialized requirements.

The second limitation is that the processing overhead is so great that the response time and throughput is poor. Therefore, they're limited in applications which have large numbers of transactions or which require good response time.

If we can find a way to build a fourth-generation language which has the full capability of doing anything that a Cobol, PL/I, assembly language or Fortran programmer can do, then it can be used for almost all programming. Then if we eliminate the performance overhead, we eliminate the second great obstacle. I think when these languages are introduced that provide this functional richness and throughput and performance, then they will catch on.

If these tools are so much better than Cobol, it would seem obvious that all mainframe installations would be using them within a few years, wouldn't it?

If IBM offered [Cincom's] Mantis [application development system], I doubt anyone would be doing any on-line programming in Cobol. Our problem is we have to promote this concept without the leverage of having IBM in

NIES from page 17

the market.

Many of the vendors are pointing to the user as being the culprit when, in fact, it's not the user's fault at all. It's the vendors' fault, who are delivering the wrong tools at the wrong quality levels, and the users are then being asked to do the impossible.

And the more they struggle, the more they fail, the more the vendors tell them they have to get their act together. It's an unjust situation.

You emphasize data base portability across a wide range of hardware lines. Why is that important to your strategy?

It's important because the nature of the operating systems on the IBM mainframe is toward a batch environment. The roots of that problem lie almost 20 years ago, when IBM had almost exclusively a batch-oriented customer base that it had to migrate across to a 360 environment, and it built a batch job scheduler, which it called the operating system. It had no on-line support. That was added later in the form of a [teleprocessing] monitor. Eighty percent to 90% of the gross horsepower of an IBM mainframe can be consumed in that mundane work which gets you ready to process an on-line transaction, and there's very little of the CPU left to process the transaction itself.

That environment is absolutely intolerable in any kind of a sophisticated on-line environment. The only way it can succeed is to co-mingle IBM mainframes with distributed, interactive-environment computers out there.

To successfully implement distributed processing, one needs to introduce the concept of an interactive operating system, which is so beautifully supported on computers like [those from] Prime [Computer, Inc.], the [Digital Equipment Corp.] VAX and others and which is woefully inadequate on the IBM mainframe. Now they can then have the IBM mainframe concentrating on batch-type operations and some limited on-line inquiry to the corporate strategic files. But out on those plant floors they would have interactive computers with an interactive operating system.

What are your plans for TES [Cincom's interactive data base and application development product]?

Our goal by Jan. 1, 1990 is to say that it is no longer necessary to write a line of code. You can simply specify requirements in a high-level way, either at the programmer or the end-user function, and all of the software will do all of the program design, development and implementation automatically.

Today we're probably 70% to 75% of the way. It is only necessary for programmers to write 25% of the code in a TES shop. The rest of the programming is automatically done by the software. We still have procedural logic that needs to be done, but today we've eliminated a lot of that with more powerful languages and so on.

Our goal in the next two to four years is to deliver the software that will eliminate what now needs to be done so that programmers, end users and system designers can specify specifications and everything else required will be eliminated.

In doing this, you have chosen not to make that big a splash about your move into relational, which a lot of your competitors have done. Do you not view that move as being that important?

I think simplifying the way you view the data is a necessary prerequisite step. However, the software business has become faddish, marketing hype, sales gimmicks, and the software industry at large is latching onto the current buzzword.

Two years ago the buzzword was "integrated." Everything was integrated, and in some cases it was laughable the way these products were integrated.

Today the buzzword is "relational." Everybody that knows anything about relational looks at most of what's out there and sees that it's laughable.

Cincom has been a relatively quiet company. Can we expect to see more of a marketing push in the coming years?

We are ready to increase our marketing capability because we've spent the last six years building a product line which we believe is preeminent. We now are in the process of substantially increasing our marketing staff, and, in fact, a number of our products are increasing sales at rates greatly ahead of the software industry in general.

We do have to find a way to get a bigger presence. I think that's a weakness of Cincom.

In the last couple of years we've also seen you move into manufacturing and now into decision support applications. Are we going to see Cincom trying to cover the entire market?

Our role is to cover all of the major systems software and office automation functions, including electronic mail, word processing, keyword and context retrieval systems. We're also talking about everything in the area of system design and development, data base, query languages, multicomputer linkups and so forth. We're also talking about a full gamut of end-user software, all the way from electronic spreadsheets, to graphics systems, to query languages. We have now completed 85%, to 90% of all the products we plan to offer in these markets.

You're a $70 million-plus company and still privately held. Software companies one-quarter your size have gone public. Why do you remain private, and do you intend to remain that way?

Our strategy is to have products which are so substantially superior that they will not have any legitimate competition. This represents a massive commitment to research and development, which means large amounts of money over a sustained period of time. If we were a public company, the pressure for profitability increases [would be] so extreme that we fear the pressures in the marketplace would force us to abandon the superiority strategy.

The second reason is because we want to be able to have a reasonable, if not substantial, percentage of the shares of our company owned by the people of the company. . . . This requires a distribution strategy of shares over some time that perhaps an outside, public ownership would not allow. We have to have this distribution before we become a public company.

We have completed much of the development effort that we wanted to do. We've also begun a major distribution of the potential ownership of the company among our people. So we're studying the stage that should Cincom want to become a public company, we can do that. We're not adverse to the public offering idea. It has its attractions.

The Solution.

Dial-Up 3270

LineMaster An intelligent device for dial-in access to your mainframe 3270 Bisync line. **LineMaster** is a communications watchdog which keeps a line in service until a user dials in.

- For any remote 327 1/4/6 line—up to 19.2K baud
- Compatible with any 3270 BiSync emulator including microcomputers
- Connects between modem and mainframe.
- Installs in minutes.

Banks urged to coordinate micro strategy

By Robert Batt
CW West Coast Bureau

SAN FRANCISCO — While personal computers solve many of the integration problems that large organizations face, their presence must be part of a coordinated strategy, attendees at the recent 1984 Insurance and Protection Conference of Financial Institutions were told. The conference was sponsored by the American Bankers Association.

Office automation, including the use of personal computers, is a combination of people, procedures and technology working together to improve productivity, noted Sally Huss, assistant vice-president at Manufacturers Hanover Trust Co. in New York.

"While our short-term goal [at Manufacturers Hanover] is to provide systems to solve specific applications, our long-term goal is to custom design systems for specific business environments — that is, have systems designed to fit the business need instead of the other way around," Huss said.

Professional business people with computing power within arm's reach will find innovative ways to solve their own business problems, Huss added.

Turning to the problem of data security, Huss maintained that the issues relating to personal computers and other end-user technologies are not very different from those associated with larger mainframe data centers.

The difficulties in controlling security with micros, she said, stem largely from the decentralized nature of the technologies involved.

Huss recommended establishing a set of guidelines for the users of personal computers. These guidelines, she suggested, are intended to:

- Prevent misuse and loss of data processing assets.
- Ensure the integrity and auditability of information created within the various departments using microcomputers.
- Minimize duplication of effort.
- Ensure that the organization receives the maximum return on its automation investment.

Becomes data center

"With a personal computer on his desk, the user in effect becomes a data center and must conform to the same requirements as any other computer installation for safe and secure operation.

"The procedures and controls put in place must be commensurate with the value of the data being protected," she contended.

Huss claimed that by educating personal computer users, by giving them hands-on experience and by helping them evaluate their security needs, an organization can make its users active participants in the protection of data and applications.

Also speaking at the conference was Laurance Ochs, a partner in the Washington, D.C., law firm of Compulaw Chartered, who warned of the growing trend toward computer crime.

"Computer fraud, regardless of the term used to describe it — computer crime, computer abuse, computer-related crime — is where the 'big bucks' are today in white-collar crime," Ochs said.

Over the last decade, he said, there has been an unprecedented growth in computer fraud, with one estimate putting the monetary loss at between $3 billion and $5 billion a year.

"The time is fast approaching when one out of every 10 people in the work force will have a direct working relationship with computers. With the number of installed computers proliferating more rapidly as a result of microprocessors, there is no doubt that computer fraud will grow proportionately," Ochs said.

The ability of a would-be perpetrator to penetrate a communications network depends, Ochs said, on several factors, including his technical knowledge of both telecommunications and the system he is attempting to penetrate and his access to or possession of the necessary interception and monitoring equipment.

The lawyer suggested that banks and financial institutions take out insurance indemnity covering employees, independent contractors, software vendors, maintenance personnel and unauthorized individuals.

Where will you be recognized for your professional capabilities?

At the folks who do it right!

Currently, we are looking for a professional who can assist management by providing analyses, appraisals and evaluations of company business activities processed by computer systems, applications and data centers of our worldwide operations.

Your primary function will be the evaluation of internal control systems, reviews of safeguards protecting company assets, checks on compliance with corporate policies and procedures, and evaluation of records, reports and other data used by management.

Requirements include a degree in Accounting (or other area of business) and a minimum of 3 years' EDP auditing experience. CISA certificate and financial/operational audit experience are highly desirable. You must be an excellent communicator (both written and oral) and be willing to travel approximately 15% (domestically and internationally). Experience within an MIS function and formal programming training would be a plus.

We offer a competitive salary and comprehensive benefits package. For immediate consideration, please forward your resume, including background and salary requirements, to: Ms. C. Pyock, Manager/Staffing, Kentucky Fried Chicken, P.O. Box 32070, Department 187A, Louisville, KY 40232. We are an equal opportunity employer, M/F.

Kentucky Fried Chicken

In the words of our users.

"The Fortune System does all of the things the minicomputers do, at a fraction of the cost."

"IBM terminals n says PCI.

Your IBM CRT can communicate with ASCII hosts, like DEC, as if it was a DEC terminal. With a stroke of the key from your IBM CRT on your desk, you become instantly DEC-compatible. Your IBM terminal is now a DEC VT-100 CRT, thanks to the PCI 74D *de*converter from Protocol Computers, Inc.

You don't have to buy new terminals; you already own them.

Your IBM 3278 is a multi-function performer. Talk to DEC hosts, including those running the Unix and VAX/VMS operating systems. Talk to Dow Jones™ News/Retrieval Service for the latest stock information. Dial-up The Source. Connect to your Local Area Networks. The PCI 74D makes previously inaccessible time-sharing and private ASCII networks instantly available.

With the stroke of the key, you're back talking to IBM.

The PCI 74D switches your IBM 3278 terminal into the ASCII mode when it receives a specific keyboard command sequence. Suddenly the asynch ASCII world is at your fingertips. And just as easily, with another stroke of the key, you're back to IBM.

The PCI 74D resides between the IBM controllers (3274s and 3276s) and the hosts (IBM and ASCII). Connections to the controller or host can be either direct or through a modem. The PCI 74D is transparent to the IBM host.

Full capabilities, both worlds.

When your 3278 is in the ASCII mode, it can be a DEC VT-100 or TTY-compatible terminal. When your 3278 switches back to IBM, it regains its IBM screen capabilities, its 3278 identity. It's a split personality terminal, with the PCI 74D.

If you'd like to hear more about how to make your IBM world non-IBM compatible, get a dialog going with PCI today. To start your conversation, here's how to speak the language.

Glossary:

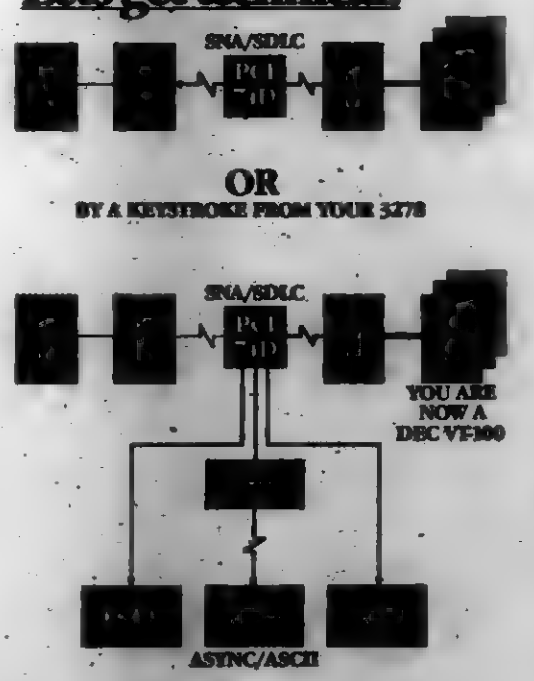
ASCII (American Standard Code for Information Interchange). The language spoken by DEC, not by IBM (without PCI).
ASYNCHRONOUS Start-stop communications technique used by low-cost low speed ASCII terminals and Personal Computers.
CoaxFACE™ Exclusive PCI device provides RS232C interface to coax cables for attachment of ASCII terminals to PCI converters.
DEC Digital Equipment Corpora-

ow speak to DEC,"

tion. Used here as synonym for an ASCII host.
DECONVERTER (74D) Makes the IBM 3270 world ASCII-compatible.
FULL SCREEN The ability to modify an entire CRT screen of data without host interruption.
MODEMS Interface to allow digital devices to communicate over phone lines.
PaperCRT™ ASCII hard copy keyboard terminals have all the versatility of 3278 CRTs with this PCI option.
PCI (Protocol Computers, Inc.) We make the non-IBM world IBM compatible. Now we make the IBM world non-IBM compatible, too.
SDLC (Synchronous Data Link Control). Line protocol for data communications between IBM systems and terminals.
SNA (System Network Architecture). IBM's approach to data communications networking.
SNA/SDLC IBM communications; non-compatible with DEC (ASCII) communications (without PCI).
SYNCHRONOUS High speed, high cost data communications technique.
PCI 74D Deconverter makes the IBM 3270 world ASCII compatible.

3274/76 IBM controllers which support 3278s, 3287s in an SNA/SDLC network.
3278/79 IBM's CRT and color CRT.*
3178 IBM low cost CRT.*
3287 IBM's printer.*
*All non-compatible with DEC (ASCII) without PCI.

Let's get technical.



For more information call today, (800) 423-5904, (213) 716-5500 in California. Or write PCI, 6150 Canoga Avenue, Woodland Hills, California 91367-3773

The Micro Mainframe Link is available from PCI:

PCI 1076: ASCII to SNA/SDLC 3270 emulation.
PCI 1051: ASCII to Sys 34/36/38 5251 emulation.
PCI 74D: Deconverter that makes IBM CRTs ASCII-compatible.
PCI 1067: SNA/SDLC to ASCII 3767 emulation. The NTO alternative.
PCI 71B/SNA: BSC 3271 to SNA/SDLC 3274 emulation.
PCI 75B/SNA: BSC 3275 to SNA/SDLC 3276 emulation.
PCI 1071: ASCII to BSC 3270 emulation.
PCI 3780/SNA: SNA/SDLC to BSC 3780 emulation.
Videotex 67: SNA/SDLC to Videotex protocol conversion.
PCI's X.25 Series: PCI 73SX and PCI R73SX, SNA/SDLC to X.25 protocol converters for host and terminal connections respectively; PCI 1076X, ASCII to 3270 SNA/SDLC through X.25 networks, PAD included.
PCI's Networkers: Keystroke for keystroke 5251/11 and 3278 keyboard compatible ASCII CRTs.
PCI's IBM-PC software packages: For 3270 and System 34/36/38 emulation.

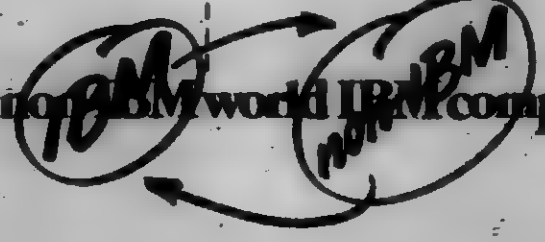
PCI Making the non-IBM world IBM compatible.



NEWS

IBM-Apple competition evidenced at Expo

By Patricia Keefe
CW Staff

HOUSTON — "So often it seems as if IBM is this mysterious presence around us at all times," observed Rod Canion, president of Compaq Computer Corp., while speaking last week here at the PC World Exposition. "This event has to do with [IBM] and [it isn't] even here — or [is it]!" he quipped, looking around.

Vendors, speakers and attendees spent three days talking about IBM, its products, future plans and the compatible marketplace; the other major topic of conversation was Apple Computer, Inc. and its relationship, or lack thereof, with IBM.

CW AT PC WORLD EXPOSITION

Neither IBM nor Apple chose to attend the show, but then they didn't need to. Anyone who wanted to examine the real thing rather than the slew of Personal Computer look-alikes on exhibit needed only to visit Computercraft, Inc.'s booth, where the IBM PCjr and Apple's widely publicized Macintosh were on display.

The Macintosh managed to steal some of the spotlight from IBM. During the Expo, it was typically hidden behind a crowd of curious onlookers, craning on tiptoes to get a closer look at Apple's new baby.

Andrew Fluegelman, editor of both *PC World* (sponsor of the Expo) and *Macworld* and a speaker at the conference, characterized attendees' reactions to the Macintosh as "reserved curiosity" and predicted the new machine will attract visually oriented people, no matter whether they are in the home or business markets. Moreover, he expects the Macintosh to replace the Lisa eventually.

And, despite the use of "standard" and "compatibility" as the two key words of the conference, Fluegelman does not foresee IBM compatibility in the Macintosh's future. In addition to Apple's decision to use non-IBM-compatible 3½-in. disks, "It doesn't need it," he asserted.

Both Fluegelman and micro industry analyst and newsletter publisher Esther Dyson agreed that if anyone can buck IBM, it is Apple. "Everyone I've talked to wants the Macintosh to succeed; 'Go Apple,' they're saying," Dyson said at a seminar called "Survival Strategies for the IBM Personal Computer Marketplace."

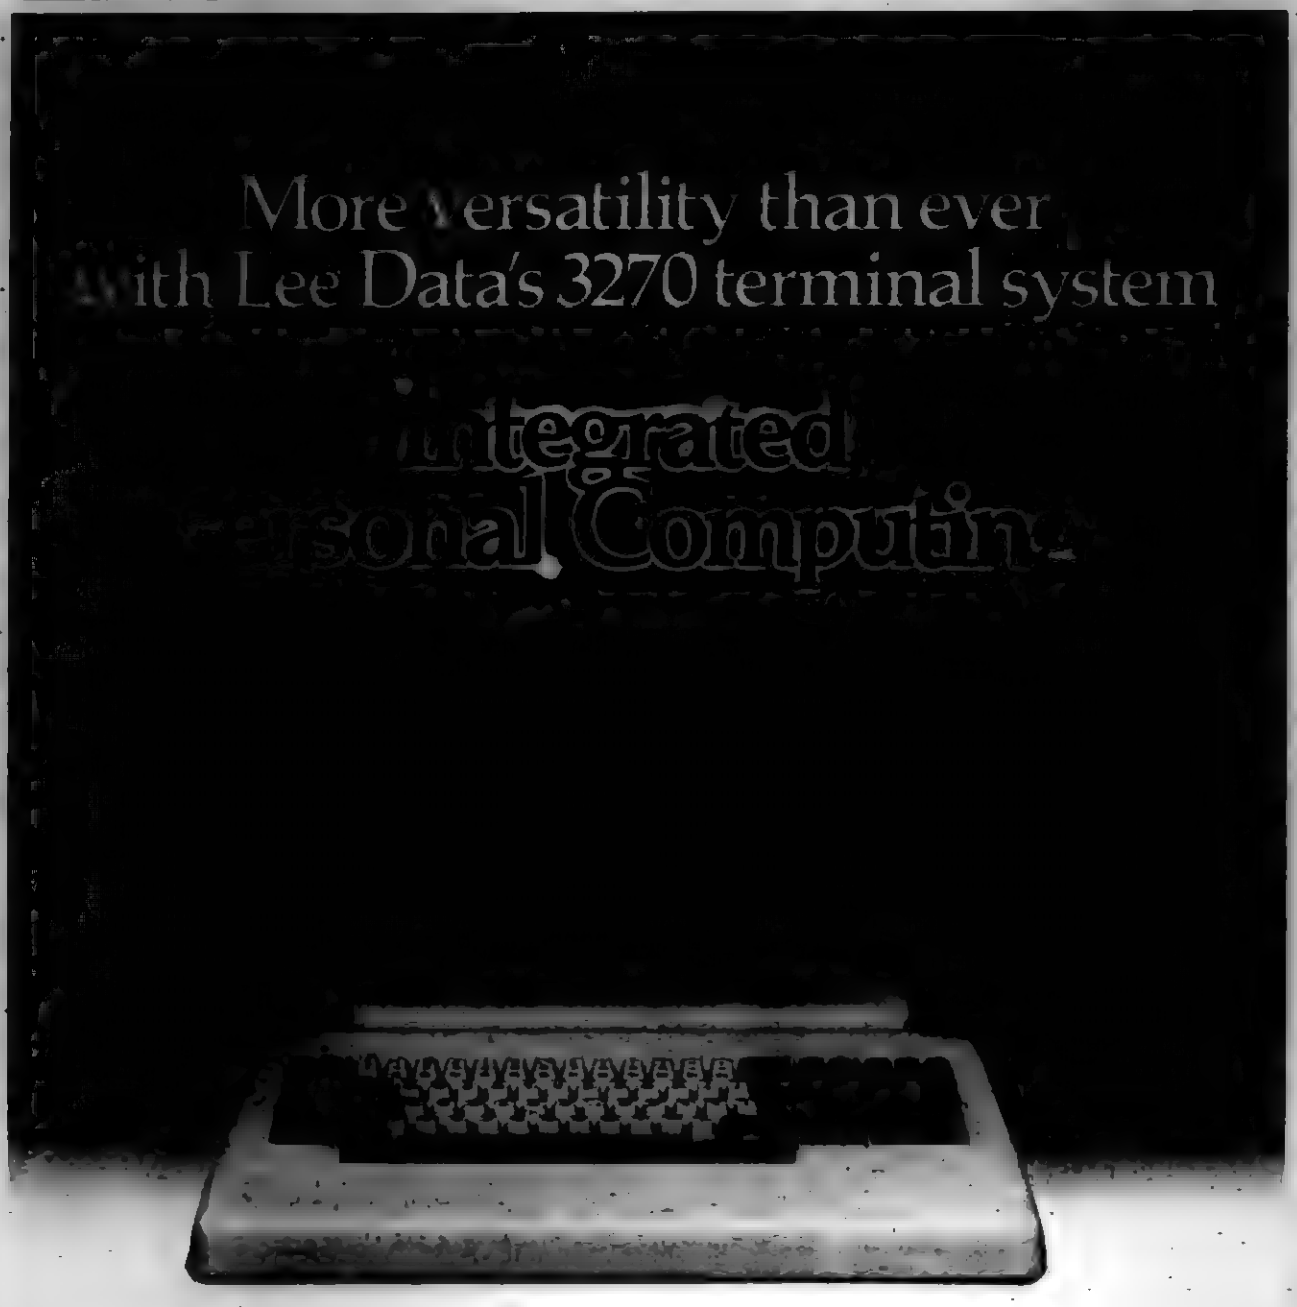
She added that Apple is appealing for two reasons: It's the underdog, and it has a lot of spirit. "I hope Apple succeeds," she said, but warned that Apple's spirit alone will not ensure success.

It is harder to sell against IBM than beside it, according to Dyson. She noted Lisa's poor showing in the corporate personal computer marketplace, adding that Apple walked away "with its tail between its legs."

Dyson expects the Macintosh to attract the next market generation — nonusers who do not want to learn Microsoft, Inc.'s MS-DOS and complicated software. The key to the Macintosh is that it combines user-friendly software with powerful hardware, she said.

Conceding that IBM has most of the third-party software vendors, many of whom are not writing for Apple, Dyson said IBM has no great advantage over the Lisa family, which includes the Macintosh.

What could hamper Apple in its bid to snub the standard is internal executive turmoil, Dyson said. "They are a small company without the stability of IBM. Also, if the Macintosh is to be successful, Apple must capture the retail channel as it did with the Apple II."



Lee Data's new Personal Workstation now lets you enjoy all the advantages of professional business computing plus have both 3270 and asynchronous access to CPU-based applications—all from the same Lee Data workstation!

That's right! Completely-integrated, IBM-compatible personal computing —offering the latest functional capabilities and these value-added features:

Support for a wide variety of popular applications, including all compatible IBM Personal Computer software.

Personal Workstation-to-host file transfer capabilities that allow transfer of data from CPU-based files through existing system communications networks, meaning no new communications networks are ever required.

A single board design that incorporates both display station and printer support, as well as 128K of random access memory standard—with up to 256K of expanded memory on the same board. Plus a dual diskette drive feature that offers two 5¼-inch floppy diskettes, each with 320K of storage capacity!

And four standard system expansion slots for add-on requirements as your needs change.

3270 and asynchronous application access and new personal computing, too—all part of an advanced system design by Lee Data.

Let us show you how easily personal computing can become a part of your company's terminal system.

Micro family, Winnie controller among Expo debuts

By Patricia Keefe
CW Staff

HOUSTON — Although it attracted about 15,000 attendees, the three-day PC World Exposition here early this month did not offer many significant hardware introductions. Many name vendors stayed away from the regional personal computer show, which catered to buyers and sellers of IBM Personal Computer products and featured more than 130 exhibitors (300 booths).

CW AT PC WORLD EXPOSITION

But scattered among the peripheral, accessory and software vendors, as well as software and training services firms, were Digital Equipment Corp.; Sperry Corp.; NEC Information Systems, Inc.; Printronix, Inc.; Compaq Computer Corp.; Televideo Systems, Inc.; Hewlett-Packard Co.; Intel Corp.; Epson America Southwest; Corona Data Systems, Inc.; and Eagle Computer, Inc.

Among the products introduced at PC World Expo, sponsored by *PC World* magazine, was a three-member family of IBM Personal Computer and Personal Computer XT-compatible microcomputer systems from OSM Computer Corp. The series includes the OSM-PC, with 128K bytes and dual, 360K-byte floppy system; the OSM-XPC with 128K bytes, a 360K-byte floppy and a 10M- or 20M-byte hard disk system; and the OSM-VIPC, which offers — in one enclosure — 128K bytes, a 360K-byte floppy, a 10M- or 20M-byte hard disk and a 20M-byte tape system.

The series features a choice of high-resolution monochrome or color monitor; Microsoft, Inc.'s MS-DOS and utilities; and OSM's PC-Link, which allows up to 16 micros (OSM or IBM) to network together. Prices for the three micros start at $24,095 for the OSM-PC; $42,095 for the OSM-XPC; and $67,095 for the OSM-VIPC. OSM is based at 665 Clyde Ave., Mountain View, Calif. 94043.

Winnie with SMD interface

Also at the show, Interphase Corp. introduced what it calls the first Winchester disk controller for the IBM Personal Computer and look-alikes that can support the storage module drive (SMD) interface commonly used in minicomputers. It is said to bring the capacity needed for large accounting and data base management applications to the personal computer level.

The Maverick SMD PC-80 reportedly offers the benefits of the SMD interface (increased capacity and speed) and accommodates 8-in. or larger disks with fixed and/or removable cartridge without software or hardware modifications.

Other features include support for two SMD drives from 16M to 1,600M bytes of on-line storage; networking that supports Xerox Corp.'s Ethernet and IBM's Personal Computer Net and X-Net; compatibility with popular operating systems; storage capacity from 16M to 300M bytes for each disk; fully buffered architecture; support for dual porting and fully programmable sector sizes up to 900 bytes; and high-speed direct memory access.

The Maverick is priced at $1,895. Interphase is located at 2925 Merrell Road, Dallas, Texas 75229.

See EXPO page 24

Have a corporate micro story?

The dust from the corporate microcomputer boom is finally starting to settle. For many firms, the mad dash to buy and install microcomputers is ending and the development of plans for coordinating and controlling micro use is beginning.

Computerworld will publish its second annual "Micros in Big Business" Special Report in the April 30 issue. This special section will focus on the success and failure of micros in large organizations. Included will be articles covering micro-to-mainframe links, microcomputer networks, compatibility issues and the growing concern about security and data protection.

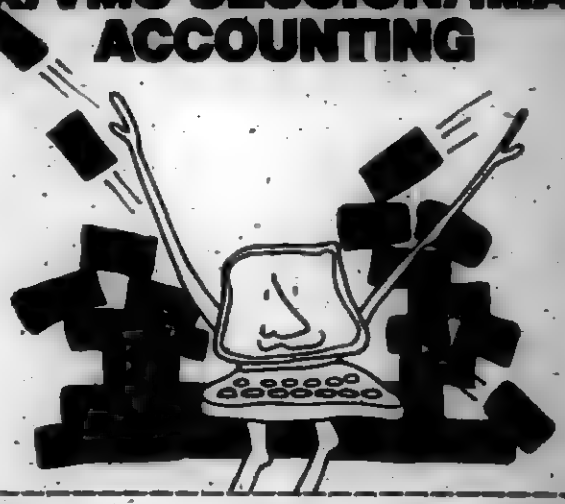
How are microcomputers working out in your organization? If you have a story you would like to share (either bitter or sweet), *Computerworld* would like to hear from you.

Contributions can take one of two forms: a tutorial article discussing an issue or trend in corporate microcomputing; or a story outlining a user's experience with micros.

Articles must be typewritten (double spaced) and no longer than eight pages. Artwork such as charts, graphs or photographs is encouraged. Authors should also include a brief biography and a phone number where they can be reached.

The deadline for submissions is March 5. Articles should be addressed to Donovan White, Special Reports Editor, *Computerworld*, 375 Cochituate Road, Box 880, Framingham, Mass. 01701.

BREAKTHROUGH IN VAX/VMS SESSION/IMAGE ACCOUNTING



Only EZTRACK™ allows examination and tracking of VMS session/image resource data by user, time interval, terminal port and other key fields. EZTRACK offers:

• General query and interactive capabilities • Flexible report writer and graphics
• Full screen forms reporting

'Bottom-up' design seen as approach for '80s

By Lynn Weiner
CW Staff

WASHINGTON, D.C. — "We have now entered a period, presumably one which is going to last a long time, in which the customer is doing 'bottom-up' design. This means that the customer is going out and buying workstations and assuming that a system exists that will allow him to hook those workstations up and do something meaningful."

Speaking at the recent Communication Networks Conference and Exposition here, Amy D. Wohl, president of Advanced Office Concepts Corp. in Bala Cynwyd, Pa., guided her audience through the changes that made "top-down" system design — buying a system and attaching a workstation — obsolete and bottom-up system design the personal computer networking approach of the 1980s. According to Wohl, this turn in design approach has occurred over the past three years and is based upon assumptions on the part of both the customer and the vendor.

For the customer, the assumption is that a standard environment is available into which the customer can plug devices. "It's similar to the transaction that people make when they go to a department store and buy an electric lamp," Wohl explained. "They take it home, secure in the knowledge that if they use it anywhere in the U.S. they will be able to plug it into any electrical outlet, and it will work. Not only is the customer assuming a standard environment, he's also assuming a standard interface."

For the vendor, Wohl said, bottom-up system design means that it will have to make one of four choices on how to fit into the marketplace:

- It can be the standard (but this position will be open only to the market leader).
- It can provide a compatible environment and sell a product that is almost the same as the standard.
- It can back out of network design, but make its product attachable to the standard.
- It can set a new standard and be outside the existing standard.

Micro personal computers

Wohl predicted that by the end of 1984, business will have more personal computers installed than ever before, with IBM delivering an estimated two million Personal Computers this year. And based on the number of personal computers in place, and particularly the pervasiveness of IBM in that market, the speaker concluded that "you can set standards in committees, but only the market leader gets to set standards in the marketplace — and IBM is very much that leader."

Other changes that have occurred in the approach to workstation design are related to who in the corporation will be active in the decision-making process and who the workstation user will be, according to Wohl. Between 1981 and 1982, the person who most commonly looked at the terminal, word processor or workstation slated to be used in the front office by a noncomputer person was an office service worker, administrator or DP manager.

By the end of 1983, however, the person responsible "for buying [and] implementing ... the workstations was the data processing manager or someone on that person's staff — the [management information systems] director, information services manager and so on," Wohl said. "And rather than look for specific functions that the workstation offers or specific interfaces with which you access that information, what have become the important workstation features are the ability to fit into an existing communications environment, compatibility with workstation standards in the company and [whether it supplies] access to data and data processing."

EXPO from page 23

Printronix unveiled the latest addition to its MVP Printer Series, a compact dot matrix line printer that is plug-compatible with the IBM Personal Computer and other microcomputers. It can be used either as a shared-resource printer for workstation clusters or as a system printer for microcomputer-based local-area networks.

The MVP 150B reportedly supports applications from graphics to word processing, including Lotus Development Corp.'s Lotus 1-2-3 and Metasoft Corp.'s Benchmark. It prints office correspondence at 80 line/min and drafts reports at speeds up to 200 line/min.

The MVP 150B is priced at $3,745 from Printronix, located at 17500 Cartwright Road, P.O. Box 19559, Irvine, Calif. 92713.

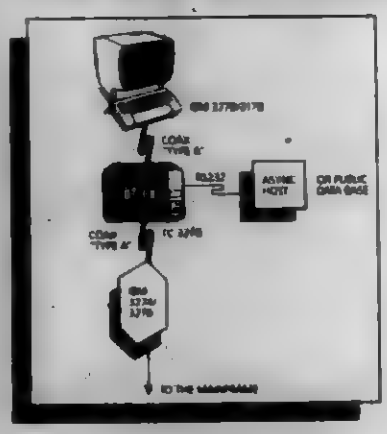
Personal Systems Technology, Inc.'s (PST) Persyst Products went to the PC World Expo to announce a single-board color display adapter for the Personal Computer and Personal Computer XT. The Best-of-Both (BOB) Display Adapter is said to support all the color graphics features offered by IBM's Color Display Adapter software.

The BOB adapter interfaces with advanced high-resolution monitors, its vendor said.

Suggested list prices begin at $425, with shipments scheduled for the end of the first quarter.

PST is located at Suite A, 115801 Rockfield Blvd., Irvine, Calif. 92714.

IBM 3278/3178 Terminal Users... "ADD-ON" PERSONAL COMPUTING CAPABILITY!



AVATAR's TC3278 terminal converter gives local computing power, communications, data storage and file transfer capabilities to your terminals. And switches between standard terminal operation and local computing with the flick of a switch.

- Includes industry standard software
  CP/M and MS-DOS (IBM compatible)
  WordStar, word processor
  Spreadsheet and simple to use utilities
- Allows dual host access
  Converts 3278/3178 to VT 100 for async ASCII host, remote hosts, public database access
- Host file transfer for data sharing and local printing
- Simple to use, easy to install, requires NO modification to terminal
- Cost Effective enhancement to existing equipment

NEWS

INTERNATIONAL REPORT

AUSTRALIA

CARLTON — An IBM 4381 mainframe supplied under IBM's third-party marketing scheme [CW, Nov. 18] is an integral part of the Traffic Authority of Victoria's massive project to automate the issuing of some 2.5 million drivers' licenses. The contract, valued at almost $4 million, was recently awarded to Computer Power here.

BRISBANE — ICL Australia Pty. Ltd. has won the lion's share of the $6 million Queensland Police Department contract. The plan calls for ICL to build a statewide network based on a dual configuration of its yet-to-be-released Estriel processor. Also sharing the contract are Era Computer Corp., which will supply an unspecified number of Era 2007 Data Encryptors, and AWA, which will provide 300 of its 9602 Intelligent Workstations.

FRANCE

PARIS — An application development system that is said to boost productivity for IBM VM/CMS and TSO users has been announced here by CAP Gemini Sogeti. Multipro combines a software package with a number of enhanced IBM Personal Computer XT workstations to create a tool for each level of program and system design, the vendor explained.

Multipro, which features a structured graphics facility and a window management function, is priced from $24,000 and will be on display at Sofcon in New Orleans on Feb. 21.

JAPAN

NAGOYA — While Japan's new domestically developed supercomputers are primarily used in universities, Japanese manufacturers are reportedly considering selling them elsewhere. Hitachi Ltd.'s first supercomputer was installed at Tokyo University, and Fujitsu Ltd.'s first supercomputer has recently been installed here at Nagoya University.

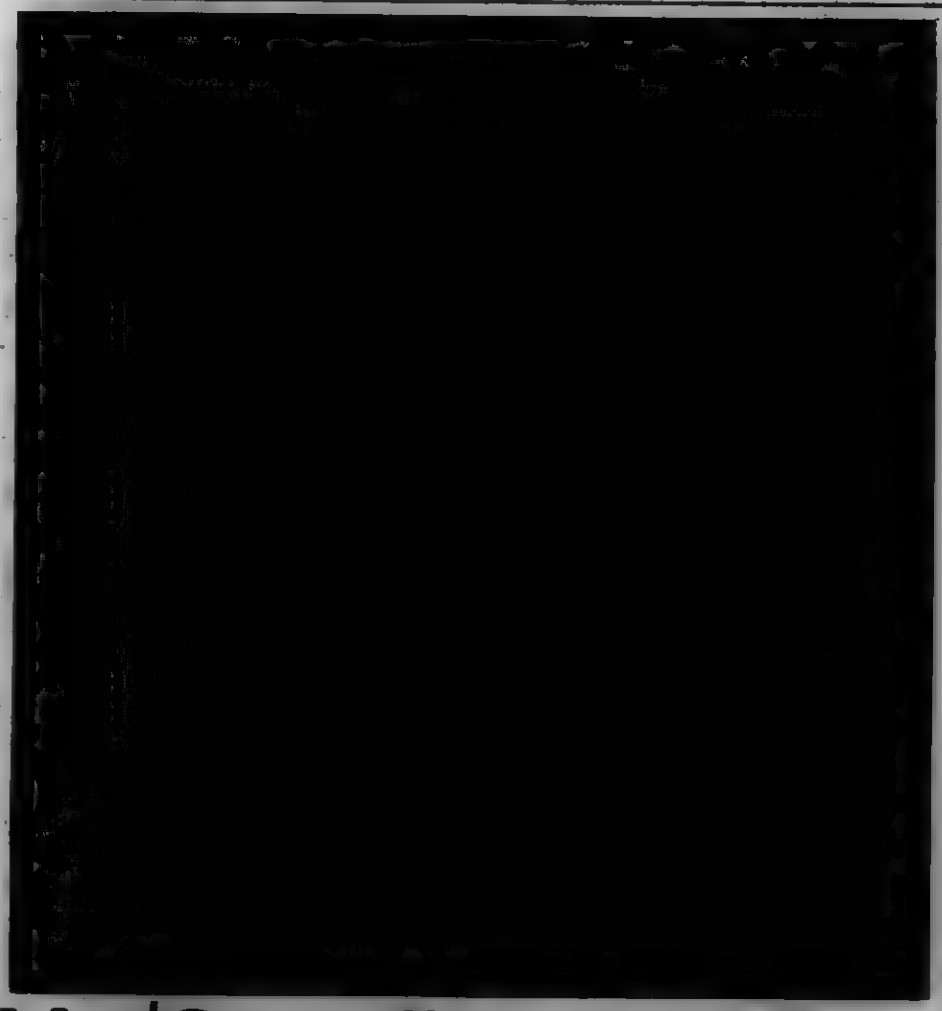
TOKYO — Toshiba Corp. has developed what it believes to be the world's first 256K-bit Cmos static random-access memory (RAM), integrating approximately 1.6 million elements on one chip. The Cmos static RAM chip features high-speed operation, low power consumption and ease of use superior to dynamic RAM, the vendor claimed. The chip was developed with micron precision and other advanced technologies, sources said.

SWEDEN

STOCKHOLM — Sweden's Prince Bertil awarded the Swedish Export Prize to Handic Software during a recent ceremony here for its "remarkable increase in export volume." Handic achieved an eightfold growth in exports in just one year, from $600,000 in 1982 to $5 million in 1983. The company attributed its success largely to the popularity of its Calc Result, a spreadsheet program that runs on microcomputers. Handic has sold over 100,000 copies of the program, 90% of which were exported.

STOCKHOLM — IBM's Swedish subsidiary, IBM Svenska AB, placed fifth in profits among IBM companies in Europe, Africa and the Middle East in 1983. IBM Svenska's volume leaped from $458 million in 1982 to $710 million in 1983; profits rose 84% to $136 million. The gains were attributed in part to a healthier Swedish economy and also to a tax break that prompted companies to purchase products before the end of the year, company sources said.

STOCKHOLM — Swedish hardware exports rose 76% last year, an all-time high valued at $470 million. Most of the exports went to West Germany (25%), France (12%), Great Britain (10%) and the U.S. (5%).



Net/One offers something unique in local area networking. A track record.

In fact, Net/One® offers a number of things unique in local area networking. True vendor independence. Media independence—baseband, broadband, fiber optics, or any combination thereof. Remote bridges and local bridges to interconnect separate Net/One systems—broadband or baseband—between buildings, or between cities, worldwide.

And all this uniqueness becomes even more so when you look at our track record. We not only talk a great network, we've actually been delivering Net/One since July of 1980. Hundreds of our systems are already out there moving information for organizations like Control Data, Caltech, Fairchild, ITT, RCA, Boston University, U.S. Forest Service, and Ford Aerospace.

Let's talk about how to turn the equipment you have now—whatever it is—into the network you want, now, with a network you can have, now. And a network that can take you wherever you want to go from here. Net/One.

Ungermann-Bass, Inc., 2560 Mission College Boulevard, Santa Clara, California 95050. Telephone (408) 496-0111.

MANAGERS ON THE MOVE

Grzanka

CHESTER T. GRZANKA has been named an assistant vice-president of Hoffmann-La Roche, Inc. in Nutley, N.J. He will continue as director of corporate computer services and assume responsibility for all data processing activities.

Grzanka joined the company in 1968 as a programmer analyst. He was formerly a project manager for ITT and IBM. He has also held adjunct teaching positions at Rutgers University.

Grzanka holds a B.B.A. from Pace University.

■

EDWARD E. WENDT has been appointed senior vice-president of California Federal Savings and Loan Association in Los Angeles. Wendt will direct MIS within the operations group at the bank's new service center in Rosemead, Calif.

Wendt joined California Federal in 1976 as department head in charge of data processing activities related to savings services. He was named assistant vice-president in 1978, vice-president in 1979 and head of the MIS division in June 1981.

Previously a DP consultant serving the financial services industry, Wendt holds a bachelor's degree in accounting from California State University in Los Angeles.

■

EDWARD BAUGH has been promoted to the newly created position of vice-president of management information systems and KEVIN MYERS has been named data processing manager for Jay-Zee, Inc. in Maryland Heights, Mo. Jay-Zee is a manufacturer of mens' clothing.

Baugh has been with Jay-Zee for 16 years. Myers, who will manage the programming operations at Jay-Zee, has been at the company 12 years.

■

Delaney

EDWARD T. DELANEY has been named vice-president for Midlantic National Bank's Information Service Department in Edison, N.J. Delaney serves as manager of Midlantic National's systems and programming area where he is responsible for the development and maintenance of all application systems.

Prior to joining Midlantic, Delaney was with the actuarial department at the Aetna Life and Casualty Company in Hartford, Conn., and programming manager of the U.S. Navy's Atlantic Command Operations Control Center in Norfolk, Va.

He is a graduate of Seton Hall University and New York University where he received a B.S. and an M.S. in mathematics, respectively.

■

MICHAEL C. BANGS has been appointed vice-president of information technology for Prentice-Hall, Inc. in Englewood Cliffs, N.J. He will have overall corporate responsibility for the introduction and utilization of information technology throughout the publishing company.

Bangs is a former vice-president, Computer Center Services, with Informatics General Corp. and has held a number of management positions with Insco Systems Corp., a subsidiary of Continental Insurance.

■

Witco Chemical Corp. in Woodcliff Lake, N.J., has appointed WILLIAM BIERNACKI, GORDON OWENS and JOSEPH TITELIUS as assistant directors of its MIS department. Witco manufactures and markets special purpose chemical and petroleum products and engineered materials.

Biernacki, previously supervisor of electronic data processing audits for Witco, assumes responsibilities for centralized systems development at the company. He has been with Witco since 1978 and has been in the DP field for 23 years. He is a graduate of Fairleigh Dickinson University in Rutherford, N.J.

Owens will be in charge of Witco's distributed systems, telecommunications and manual procedures. He comes to his new position after serving as a regional director of MIS for the company at Melrose Park, Ill. He joined the Richardson Co. at that location in 1977 prior to its acquisition by Witco. A graduate of Dartmouth College and Northwestern University, he began his DP career in the early 1960s.

Titelius will be responsible for operations at Witco's various computer centers in the U.S. Previously manager of the company's corporate data center, he has held various positions in data center operations since joining Witco in 1959.

■

MARTIN B. ROSCH has joined Ipco Corp., a provider of health care products and services, as director of management information systems in White Plains, N.Y., where he will plan and coordinate the information needs of Ipco corporate headquarters. He will provide guidance and assistance in the MIS area to all Ipco divisions in addition to his responsibility for management of the corporate data center.

For the past 11 years, he served as director of MIS for Sony Corp. of America.

He received a B.S. in 1963 from Brooklyn College and an M.S. in 1964 from Penn State University.

NOW CCA'S MODEL 204 DBMS CAN DO SOMETHING EVERY EXECUTIVE CAN APPRECIATE.

NEWS

JESS D. RAY has joined Associates Bancorp in Chicago, an affiliate of Associates Corp. of North America, as vice-president of business systems.

Ray is responsible for business systems at Associates Commercial corporate headquarters in Chicago, which includes information processing services for the Chicago organization plus interfacing with Associates Bancorp's central data processing operations in South Bend, Ind.

He most recently was manager for marketing and sales of Raytheon Computer Services in Chicago. He has also been vice-president of the Midwest region for Information Industries, Inc.; director of marketing for Computer Sciences Corp. in Los Angeles; and regional manager for Docutel Corp. in Chicago.

Ray attended the University of Dayton and has a bachelor's degree in marketing from Elmhurst College, followed by graduate-level courses in marketing strategy at the University of Chicago and Northwestern University.

■

Dunlevy

PAUL B. DUNLEVY has been promoted to corporate manager of systems for Cyclops Corp. in Pittsburgh. He will coordinate the systems and communications activities of Cyclops' various steel, specialty retailing and nonresidential construction divisions nationally and internationally.

Dunlevy, who joined Cyclops in 1961, was most recently director of systems and data processing for the Universal-Cyclops specialty steel division.

Dunlevy is a University of Pittsburgh graduate with a bachelor of science degree.

■

GERARD MAGLIOCCA has been promoted to manager of systems planning and administration for Squibb Corp. of Princeton, N.J. His responsibilities include worldwide MIS planning.

Magliocca has served as a programming analyst and designed the development of real-time automation laboratories for Squibb. Additionally, he has served as project manager of financial systems and internal consultant for Squibb's international operations.

He has a B.S. in mathematics and an MBA in finance from Wagner College.

■

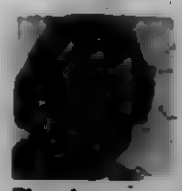
DINEASH MANGALICK has been appointed manager of Varian Associates' Information Systems Services in Palo Alto, Calif. Mangalick will supervise business applications in the Systems Development and Information Center.

He has been with Varian since 1974 and was previously manager of marketing/accounting systems development.

A 15-year veteran of the data processing field, Mangalick has held positions at Control Data Corp. and Essex Wire & Cable.

He received an M.S. degree in industrial engineering from the University of Minnesota in 1967.

■



Plourde

DR. PAUL J. PLOURDE has been appointed the first vice-president for information services at Bentley College located in Waltham, Mass. Plourde, whose background includes teaching and research in data base management systems and analytical models in higher education, has served as interim director of the college's computer center.

He joined Bentley in 1979 as associate professor of computer information systems and coordinator of the master's program in computer information systems.

Before joining Bentley, Plourde served as professor and chairman of the Computer and Information Sciences Department at the State University of New York at Potsdam; director of the Three College Computer Center in Amherst, Mass., serving Amherst, Hampshire and Mount Holyoke Colleges; and a director of the New York Higher Education Assistance Corp.

He was president (1976-1978) and board member of the Concom Users Group and president and board member of Byytebaack, Inc., a software firm owned by 24 institutions of higher education. He is currently president of Cause, the association for the development, use and management of information systems in higher education.

Plourde holds a bachelor of arts from the University of New Hampshire, an M.A. from Northeastern University and a doctorate in education from the University of Massachusetts.

■

LARRY E. TRAVIS, a professor of computer science at the University of Wisconsin-Madison, has accepted an appointment to head the university's academic computing center.

Travis joined the UW-Madison faculty in 1964. He served from 1970-72 as director of UW-Madison's Office of Computing Affairs. From 1979-81, he was chairman of the computer sciences department.

In 1981-82, Travis was at the University of Delaware, where he was professor of computer science and electrical engineering and associate provost for computing.

He received his bachelor's degree from the University of Colorado in 1951 and his doctorate in the philosophy of science from the University of California, Los Angeles in 1966.

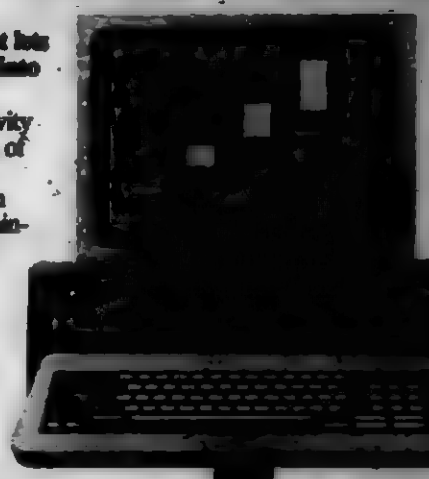
TALK SENSE TO THE IBM PC.

Introducing PC/204, a link that lets PC users turn mainframe data into spreadsheets effortlessly.

PC/204, the newest productivity tool from Computer Corporation of America, is a powerful, efficient, easy-to-use software link between IBM personal computers and mainframes. It effectively answers the pressing problem of how to let corporate managers take full advantage of today's personal computers for making decisions, while also giving them access to the corporate database in a format they can use.

First, PC/204 guides PC users as they browse through the MODEL 204 database. Then it extracts the data they need and converts it into meaningful management information for spreadsheet analysis. Lotus 1-2-3 for example. And PC/204 does all that automatically. Without the PC user having to understand anything about mainframe technology.

If you aren't already using Lotus 1-2-3, we can supply it along with PC/204. Or you can use any current IBM PC business package.



While PC/204 is helping business managers, it's also helping MIS directors.

PC/204 uses the power and intelligence of the personal computer for increasing the overall efficiency of an application.

For one thing, it improves performance of the mainframe by offloading some of the processing to the PC, while reducing PC users' response time. It also makes communication between the PC and the mainframe more efficient.

What about security and control? PC/204 provides individual management views of the corporate database while still allowing PC users access to all the information they need.

PC/204 is the latest reason to get MODEL 204 DBMS which has been so highly rated for performance and programmer productivity.

For more information or to arrange for a demonstration of PC/204's capabilities, simply return the coupon or write to us on your letterhead.

NASCP annual conference slated for San Francisco

SAN FRANCISCO — Some 400 strategic planning executives are expected to attend the annual conference hosted by the North American Society for Corporate Planning (NASCP), scheduled at the Sheraton Palace here April 29 to May 2.

"From Steel to Silicon: Planning in a Restructured Economy" is the theme of this year's meeting, which will focus on five key issues addressing the transition to new technology: "How to Manage the Development and Introduction of New Technology"; "The Politics of Change"; "Succeeding in the Global Marketplace"; "Leadership, Entrepreneurship and Culture"; and "CEO Views."

Speakers will include Nolan K. Bushnell, founder of Atari, Inc. and now chairman of Catalyst Technologies; Kenich Ohmae, author of *The Mind of the Strategist*; public opinion researcher Mervin Field; and Nucor Corp. President F. Kenneth Iverson.

The conference fee is $625 for members and $700 for nonmembers; additional information is available from NASCP, 300 Arcade Sq., P.O. Box 1288, Dayton, Ohio 45402.

Strategic Data Planning sets March 26 conference

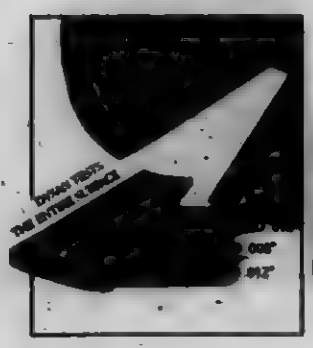
BETHESDA, Md. — The sponsors of the Strategic Data Planning Conference that will be held March 26-28 at the Marriott Hotel here have announced that Dr. Robert H. Holland will deliver the keynote address.

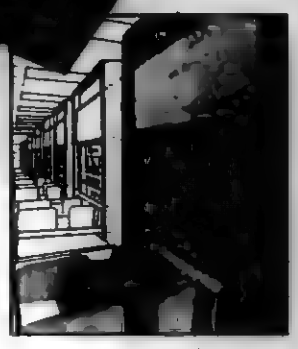
President and chairman of Holland Systems Corp. of Ann Arbor, Mich., Holland will speak on "Strategic Information Planning — the Foundation for Integrated Success." His address will deal with the need for developing an integrated information resource through strategic planning, which encompasses business direction, data and information, hardware, software and communications.

Other speakers scheduled include Henry O. Wintermute of 3M Co., Art Viles of IBM, John Janis of GTE Data Services, Inc., Arvind Shah of Performance Development Corp. and William Baker and James Odell of Database Design, Inc.

The three-day Strategic Data Planning Conference costs $895. More information is available from its sponsor, Barnett Data Systems, at 19 Orchard Way N., Rockville, Md. 20854.

Four Reasons Why The Dysan Difference is Worth Paying For





1. 100% Surface Tested

Only Dysan provides fully usable diskette surfaces that are truly 100% error-free across the entire face of the diskette. An exclusive on-and-between the track testing procedure guarantees error-free performance regardless of temperature and humidity distortions or slight head misalignments.

2. Advanced Burnishing Techniques

Dysan's advanced polishing methods create a smoother, more uniform diskette surface. This results in better signal quality on each track, less wear on drive heads and reliable access to data after millions of head passes.

3. DY10™ Lubricant

Dysan's proprietary DY10 lubricant complements the advanced burnishing process. Both maximize error-free performance while minimizing headwear. Optimal signal presence is maintained between the head and diskette surface during millions of write/read interfaces.

DY10 is a trademark of Dysan Corporation

4. Auto-Load Certification

Dysan's unique quality control methods reflect technological leadership in designing, producing and testing precision magnetic media. Each diskette is unerringly certified by Dysan-built, automated and microprocessor controlled certifiers. Your system and data base will benefit from Dysan's diskette reliability and unsurpassed quality.

Select from a complete line of premium 8" and 5¼" diskettes, in single or double densities, certified on one or both sides.

Forum to focus on DSS issues

NEW YORK — A two-day conference dealing with managerial issues in the evaluation and selection of decision support software (DSS) will be held May 21-22 at the New York Hilton at Rockefeller Center.

The conference is titled "Evaluating Decision Support Software: Personal Computer, Mainframe and Distributed Applications — a Managerial Perspective." It is being sponsored jointly by C. Lawrence Meador, executive vice-president of Research & Planning, Inc., the New York chapter of the Planning Executive Institute and the Information Technologies Institute.

The conference will focus on key issues involved in the implementation of DSS with personal computers, mainframes and distributed systems, including managerial user needs assessment, problem diagnosis and networking.

Among the speakers will be Peter G.W. Keen, chairman of the board of Micro Mainframe, Inc.; Michael S. Scott Morton, management professor at MIT's Sloan School of Management; David Ness, associate professor of decision science at the University of Pennsylvania's Wharton School of Business; and Research & Planning's Meador.

Registration for the conference costs $495. More information is available from DSS Conference, 215 First St., Cambridge, Mass. 02142.

Strategem users to meet in March

BOSTON — Integrated Planning, Inc., the developer of the Strategem decision support system, will hold the first meeting of the Strategem Users Network (SUN) here March 22-23 at the Westin Hotel.

The keynote address will be given by Terry Gallagher, unit director of Mars Group Services, the information processing arm of the Mars Co.'s European operations.

There is no charge for Strategem users to attend the meeting. Integrated Planning is located at 338 Newbury St., Boston, Mass. 02115.

NEWS

Chips & Changes exhibit to begin national museum tour

SAN FRANCISCO — The Chips & Changes exhibit will begin a two-year national tour at the San Francisco Exploratorium, where it will run March 14 through May 10.

Billed as the first major computer technology exhibit that also examines social change, Chips & Changes will combine hands-on and computer-based interactive exhibits, live demonstrations and audiovisual presentations exploring computer chip technology and its cultural ramifications.

Organized by the Association of Science and Technology Centers, Chips & Changes will travel to nine major American museums.

In addition to the San Francisco Exploratorium, the Chips & Changes exhibit will visit the Oregon Museum of Science and Industry in Portland June 9 through Aug. 5; The Science Place in Dallas Aug. 25 through Oct. 21; the Science Museum of Minnesota in St. Paul Nov. 10 through Jan. 6, 1985; the Museum of Science and Industry in Chicago Jan. 26 through March 24, 1985; the Science Museum of Virginia in Richmond April 13 through June 9, 1985; the Museum of Science in Boston June 29 through Aug. 25, 1985; the Franklin Institute Science Museum in Philadelphia Sept. 14 through Nov. 10, 1985; and the North Carolina Museum of Life and Science in Durham Nov. 30 through Jan. 26, 1986.

The exhibition is funded by the National Endowment for the Humanities and Intel Corp., with additional funding from Digital Equipment Corp. and the Warner Communications Foundation.

Robots to be sold to jails for use as guard devices

By Peter Bartelik
CW Staff

WOBURN, Mass. — Robots are ready to move off the factory floor . . . into jails.

At least that is the plan of a two-year-old company here that recently contracted to supply about 200 mobile robots a year for five years beginning in 1985. Denning Mobile Robotics, Inc. announced recently it will provide mobile robots to Southern Steel Co. of San Antonio, Texas, which, in turn, will sell the devices to prisons to be used as guard devices. The robots will not replace guards, but will be used in tasks that are boring and dangerous, such as patrolling hallways at night.

The robots will not replace guards, but will be used in tasks that are boring and dangerous, such as patrolling hallways at night.

The company has not yet produced a fully functioning prototype. "We have a mobile robot, but it doesn't detect [a human presence]," said Benjamin Wellington, vice-president at Denning, who added that a prototype should be completed in early spring or late summer.

The young company was not established with the goal of churning out prison guard robots. The idea, according to Wellington, was to develop security guard robots for general business use. That is still the main target; developing a jailhouse application "is only marginally different," he said.

The robot currently under development will stand four-feet tall, weigh about 200 lb and come equipped with infrared and ultrasonic sensors along with ammonia "sniffers" to detect odors given off by human bodies.

The robot will be programmed to speak as many as 10 different sentences, including warning escaping prisoners, "You have been detected."

Encased in an armored body will be two Motorola, Inc. 68000 microprocessors, "vast amounts" of random-access memory and some erasable programmable read-only memory (Eprom), Wellington said.

Eprom memory will store information that must be non-volatile, such as a map of the prison structure.

Powering the robots will be lead-acid batteries carrying over 2,000A. One of the fundamental problems in designing the product is placing enough on-board power in the units. As designed, the machines will operate for 12 hours and recharge for three hours.

The robots will communicate constantly with a base station via microwave. There are no plans to have the robots communicate with a central computer, Wellington said.

Denning currently employs 14 people and will expand to between 20 and 25 people during development and production of the first six field test units. The company president and founder, R. Warren George, formerly headed his own Washington, D.C.-based management consulting firm, Denning Associates.

According to Wellington, the company has industrial liaisons with robotics centers at MIT and Carnegie-Mellon University and "some superior people working on the artificial intelligence aspects."

NYPD bomb squad using robots in life-threatening situations

NEW YORK — It's become a cliche that the ideal tasks for robots are those that are either too tedious or too dangerous for humans. The New York Police Department (NYPD) now utilizes three strictly mechanical, remote-controlled robots in potentially life-threatening situations.

In early January, one of NYPD's robots was loaned to the Elmira, N.Y., police department during a shoot-out that left one policeman dead and two others injured. Two gunmen were cornered in an apartment, and police eventually used the robot device "to go in and ascertain the suspects were dead," a spokesman for the Elmira police department said. He declined to discuss NYPD's devices.

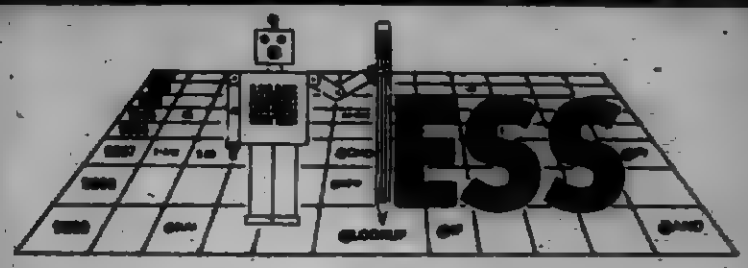
Nor would NYPD discuss the use of the device in Elmira, but it was willing to talk about the general functions of its robots. NYPD obtained its first robot last February and has since acquired two others, one for its bomb squad and one for its emergency squad. The robots were purchased from a Canadian firm, Pesco, which has been producing them for six years.

Detective Frank Guerra, training officer for the bomb squad, said his department uses a robot two to three times a week. Bomb squad technicians operate the robots via a remote panel linked to the device.

The robots weigh 230 lb., measure 40-in. long by 26-in. wide and move on six independent wheels. The robot's carriage is levered so the device can climb over curbs. Power is provided by two 12V wet-cell batteries.

The robot units each contain an X-ray monitor, a spotlight and a camera that can span 360 degrees and send a picture back to the control panel. A mechanical hand can open and close with a "soft touch, to pick up something like an egg or glass of water, and a hard touch, to pick up items like briefcases," Guerra said.

He compared the squad's use of the robot to a golfer's use of a particular club. "In golf, you have several clubs; the bomb squad technician has X-ray devices, dogs and the robot. Whatever the technician feels he needs to do the job, he selects," Guerra said.



Electronic Spread Sheet for VM/CMS & MVS/TSO
- Not Just Another CALC -

Powerful - Spreadsheet size is limited only by available virtual storage. ESS easily handles spreadsheets with thousands of rows and/or columns.

Proven - Already in use at over 100 installations.

Compatible - ESS accepts the same commands as VisiCorp's VisiCalc® program for microcomputers. A person familiar with VisiCalc® can be using ESS productively in minutes. In addition, ESS can load and save files in VisiCalc® format.

High Performance - Assembler language code and sophisticated storage management techniques give you fast response, even with very large spreadsheets.

Easy to Install - Just load the ESS program. No additional program products or languages are required.

Cost Effective - ESS gives all your users access to personal computing capabilities for just $220 per month. Compare that to the cost of buying hundreds of microcomputers.

Questions? - For more information about ESS, or to arrange a 30-day free trial, call or write TRAX.

WHAT TO LOOK FOR IN ON-SITE TRAINING

With all the technical training options around today, it's hard to figure out which company will offer the most professional, reliable on-site training. Here's Sys-Ed's checklist of key benefits that will make your training investment really pay off.

ARE THESE BENEFITS INCLUDED?	SYS-ED	OTHERS
• Qualified training consultant for needs analysis and skills inventory?	YES	NO
• Comprehensive, coordinated curricula of CICS, IMS, VSAM, TSO ISPF or MVS JCL training?	YES	NO
• Complete range of training for the IBM environment, including IDMS, DATACOM, ADABAS and FOCUS?	YES	NO
• Ongoing technical support?	YES	NO
• Satisfaction guarantee?	YES	NO
• Additional charge for customized training?	NO	YES
• Thousands of solid references?	YOU BET	?

If you ask other training companies the answers to these tough questions, you'll probably make the decision thousands of decision-makers like yourself made: to get your training from The Computer Education Professionals at Sys-Ed.

Write Sys-Ed or call 212-889-3386 for more information about the range of on-site course options. By the way, we also offer public, regional and consortium courses.

____ Tell me about your on-site training.
____ I'd like a schedule of your public courses in my area.

BOOK REVIEWS

THE UNIX OPERATING SYSTEM BOOK
By Mike Banahan and Andy Rutter

If you have access to a terminal on a system running Unix, then pull up a chair, open this book and delve into the intricacies of this operating system. There's no standards discussion here, no comparisons to Pick & Associates, Inc.'s Pick or Digital Research, Inc.'s CP/M operating systems and little speculation about Unix's place in the 16- or 32-bit worlds.

The book is a hand-holding walk through the shell and down to the kernel of Unix. In Chapter Eight, the hand is let go. Topics fit for a beginner (files and simple commands, the editor, C language, filestore) give way to more complicated matters (the process environment, libraries, maintenance).

Paperback, 318 pages, $16.95, ISBN 0471-89676-4. John Wiley & Sons, Inc., 605 Third Ave., New York, N.Y 10158.

DESIGNING AND IMPLEMENTING LOCAL-AREA NETWORKS
By Dimitris N. Chorafas

The book begins by answering a question few people are asking anymore: "Why should we want to link micros?" But the answer does illustrate the pressure widespread personal computer use is exerting on the creation of local networks. The real question for data processors, as Chorafas says later on, is not whether they should develop a network for their users, but which one they should develop.

Broadband is emphasized in the technical section as the feature most important in a system where a single carrier must combine different services.

"In the 1980s," the author says, "the bandwidth need will exceed other system requirements. The more we have, the more we want. Bandwidth will be a dominant factor in implementing office automation systems."

In the product section, commercial offerings are analyzed to show the various ways the technical features of the first section are utilized. Under scrutiny are Corvus Systems, Inc.'s Omninet, Nestar Systems, Inc.'s Cluster One, Xerox Corp.'s Ethernet and Datapoint Corp.'s Attached Resource Computer, the earliest local network extant.

Hardcover, 354 pages, $32.95, ISBN 0-07-010819-6. McGraw-Hill Book Co., 1221 Ave. of the Americas, New York, N.Y. 10020.

DIGITAL IMAGE PROCESSING
By Gregory A. Baxes

How do you get a clear photograph of the moon? Image processing — the alteration and analysis of pictorial information — was developed by the National Aeronautics and Space Administration to answer that question on the Apollo missions. Today, image processing sees use in medical, factory automation and robotics control applications, among others.

Understanding image processing requires understanding the human eye, which is the starting point for this book. Spatial and brightness resolution, histograms, pixel points and data compression are basic processing concepts covered.

After the concepts comes the hardware that makes the concepts work. Commercial equipment supports the five primary functions of data handling: image digitization, image storage, image display, external host-computer interface and internal image processor interface. The author's rule of thumb: The more a system costs, the faster and more flexible it will be processing image data.

Paperback, 184 pages, $14.95, ISBN 0-13-214056-X. Prentice-Hall, Inc., Englewood Cliffs, N.J. 07632.

BOOKS OF NOTE

RELATIONAL INFORMATION SYSTEMS, by T.H. Merrett: *hardcover, 507 pages, $32.95, ISBN 0-8359-6643-9. Reston Publishing Co., Reston, Va. 22090.*

THE UNIX PROGRAMMING ENVIRONMENT, by Brian W. Kernighan and Rob Pike: *hardcover, 357 pages, $26.95, ISBN 0-13-937699-2. Prentice-Hall, Inc., Englewood Cliffs, N.J. 07632.*

THE KISS PRINCIPLE: APPROACHES TO BUILDING RELIABLE SYSTEMS, by Ronald B. Smith: *hardcover, 207 pages, $19.95, ISBN 089433-198-1. Petrocelli Books, Inc., 1101 State Road, Princeton, N.J. 08540.*

THE SOFTWARE GUIDE: IBM PERSONAL COMPUTER & XT, by Gerald VanDyver: *paperback, 1,035 pages, $24.95, ISBN 0-912003-00-3. Micro-Information Publishing, 15420 Eagle Crest Ave., Prior Lake, Minn. 55372.*

VIRTUAL STORAGE ACCESS METHOD, by Ronald K. Ferguson: *paper (for three-ring binder), 425 pages, $32.50. Software Information Services, P.O. Box 4132, Bellevue, Wash. 98009.*

Casa/SME names Hall president

DEARBORN, Mich. — John C. Hall, vice-president of North & Donahoe of Santa Ana, Calif., has been elected president of the Computer and Automated Systems Association of the Society of Manufacturing Engineers (Casa/SME).

He succeeds Gordon A. McAlpine, who is associated with Tuma Engineering in Troy, Mich.

The membership of Casa/SME includes more than 7,000 engineers and executives. The organization has 38 chapters worldwide.

How Dave Vipler "dumped the dumb"

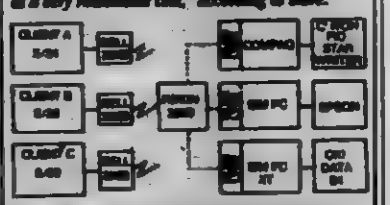
Experienced and consolidated consultants know that customer support is the name of the game. Dave Vipler, new managing director of the New York based *Computer Consulting Center*, in his 14 years with I.B.M. saw too many clients get burned by here today-gone tomorrow consultants. What seemed like a finished program package invariably needed additional work once the consultant left.

Dave recognized that a quality consulting service must provide continuing client support. In 1981 he founded the Center to assist business with their I.B.M. 5/34, 5/36, 5/38, 36xx, 4300 series systems and PCs.

"The Center was organized to provide quality computer consulting to clients that are integrating distributed processing systems into their computer environments," said Dave.

With a staff of 22 professionals, Dave felt that the Center could adequately support its New York City users. Plans to significantly expand their New Jersey operations prompted Dave to find a more convenient method of maintenance, particularly for those programming bugs that only surface after office hours. It was one thing to have a programmer drive an hour each way to spend a full day on site, Dave reasoned, but to make the trip for a half hour of "Troubleshooting" was too costly.

"One client said, 'How do we get you back if we have problems?' BLUE LYNX was the answer for us at a very reasonable cost," according to Dave.



The Center now has 2 PCs, 2 XTs, and 2 Compaqs, each equipped with BLUE LYNX. Their programmers can now sit at their desks and modify programs on I.B.M. host systems downtown, in New Jersey or wherever the accounts are located. Dave's clients were so impressed with BLUE LYNX that some have bought the hardware/software package for their own internal needs.

"The BLUE LYNX™ documentation was excellent, it went up easily and with no support from Technland required. We now use BLUE LYNX to support clients in New York City, as well as those in New Jersey. With BLUE LYNX behind us we can now use our communications ability not only for programming tasks but also as a sales tool."

BLUE LYNX terminal packages include: 3101
3252/12 emulation for 5/34, 5/36 and 5/38.
3276 emulation SNA/SDLC or Bisynch.
Hardware/software package 3626 complete.
Combination of 2 emulators 3230.
VT220/1 - DEC VT220/52 emulation software $160

NOTICE: PAYMENT IS DUE 10 DAYS PRIOR TO EACH SESSION

CHANGING OUR NAME WAS A STICKY BUSINESS.

After 14 years as Intertel, it wasn't the easiest thing to do. Sure there were the obvious problems; like licking 19,453 labels so we could show off our fancy new logo. But we also found that Intertel was more than just a name to the hundreds of companies that depend on our network command center systems and diagnostic modems for high-availability data communications. It was a constant reminder to them of our commitment to providing the products, support, and services they need to keep pace with the ever increasing size and complexity of their private line networks.

However, we had to face the fact that our old name described only a part of what our current products can do and what the systems we are developing will offer in the future. We decided that changing our name would be an important first step in linking our past accomplishments with future networking needs.

Now, when you think of controlling, managing and measuring the performance of large networks, remember what we did as Intertel. When you need to assure fault-tolerant operation of networks with both analog and digital links, remember Intertel did it first. But when you're ready to find out more about our networking capabilities, please think of them as INFINET.

University users developing own applications

ALBANY, N.Y. — At many large computer installations — even those with 24-hour, seven-day operations — there often is not enough time to develop application programs for individual users or small groups.

But such applications are often vital to middle-line managers and the performance of their departments. Lacking them, those departments have been scurrying to microcomputers to satisfy their processing needs.

The State University of New York here had just that problem. The university had plenty of room on its Sperry Corp. 1100 series mainframe processors. The 10-person DP staff had a "hard time getting mandated things done," noted Pat Panzl, assistant director for Administrative Systems Development, and definitely not enough DP personnel to develop applications for everyone.

The solution, Panzl said, was teaching users to develop their own applications using Sperry's Mapper application development package linked to an 1100/83 mainframe. There are currently 25 to 30 Mapper terminals on campus and 15 Mapper applications in place. While a total of 400 computer terminals are in operation on the campus, most were installed before Mapper came on the scene in 1981. Those terminals cannot be adapted to use the Mapper program, Panzl said.

Of the 15 Mapper applications, only one would have been given any priority by the systems development staff. That program, which links financial aid to draft registration, is a government-mandated application.

The university is using Mapper as an alternative to microcomputers. "Almost any office would be better served with Mapper when accessing institutional data than with any personal computer," said Barbara Wolfe, associate vice-president for Computing Services.

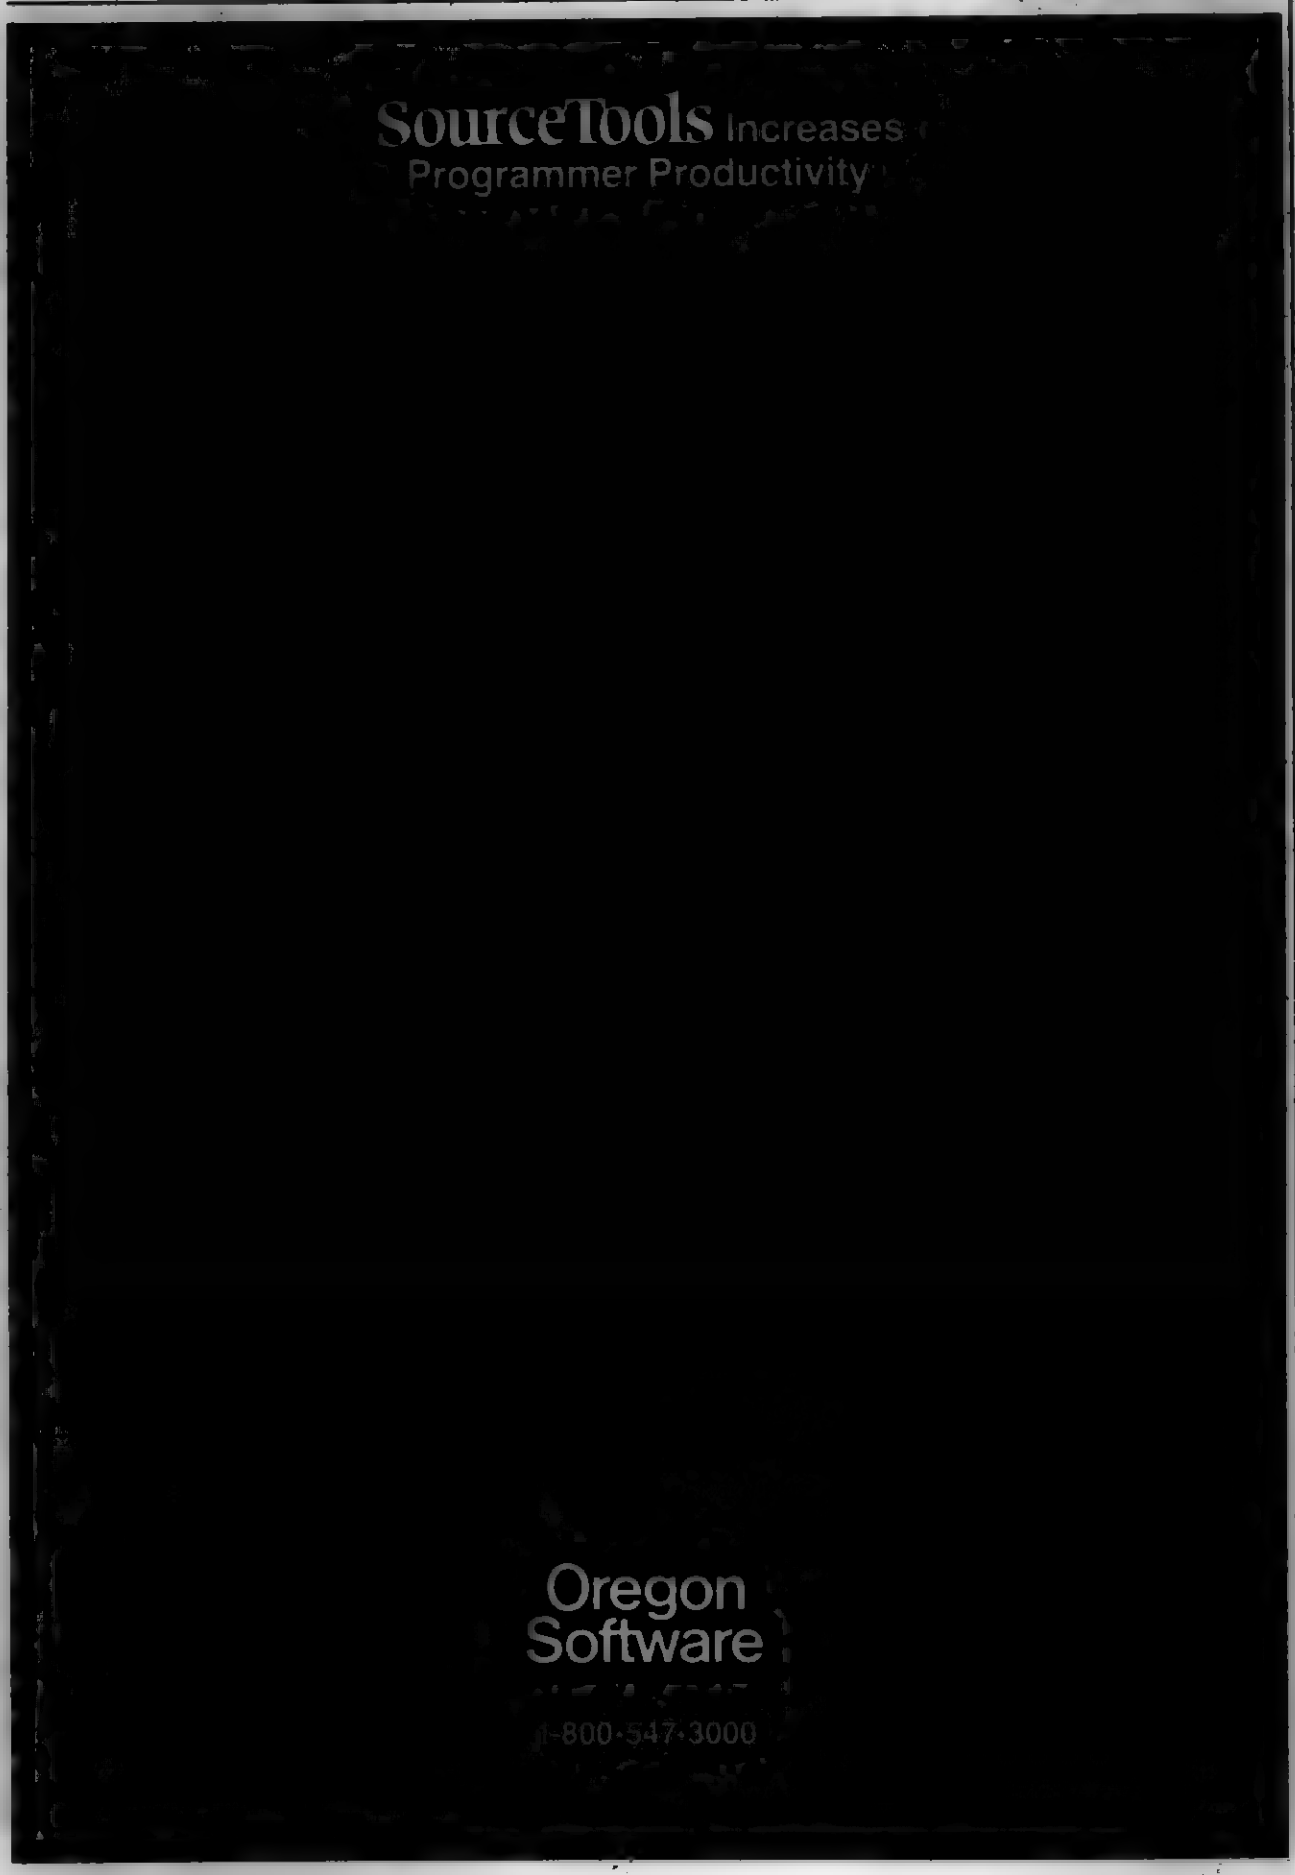
As evidence, she cites an application for scheduling students to counselors. With a microcomputer, the administrator would have to key in information gathered during student registration. The Mapper package, on the other hand, enables the user to access the main computer data base where the student information is stored. The administrator can then manipulate the data to obtain the desired results without duplicate data entry or synchronization problems.

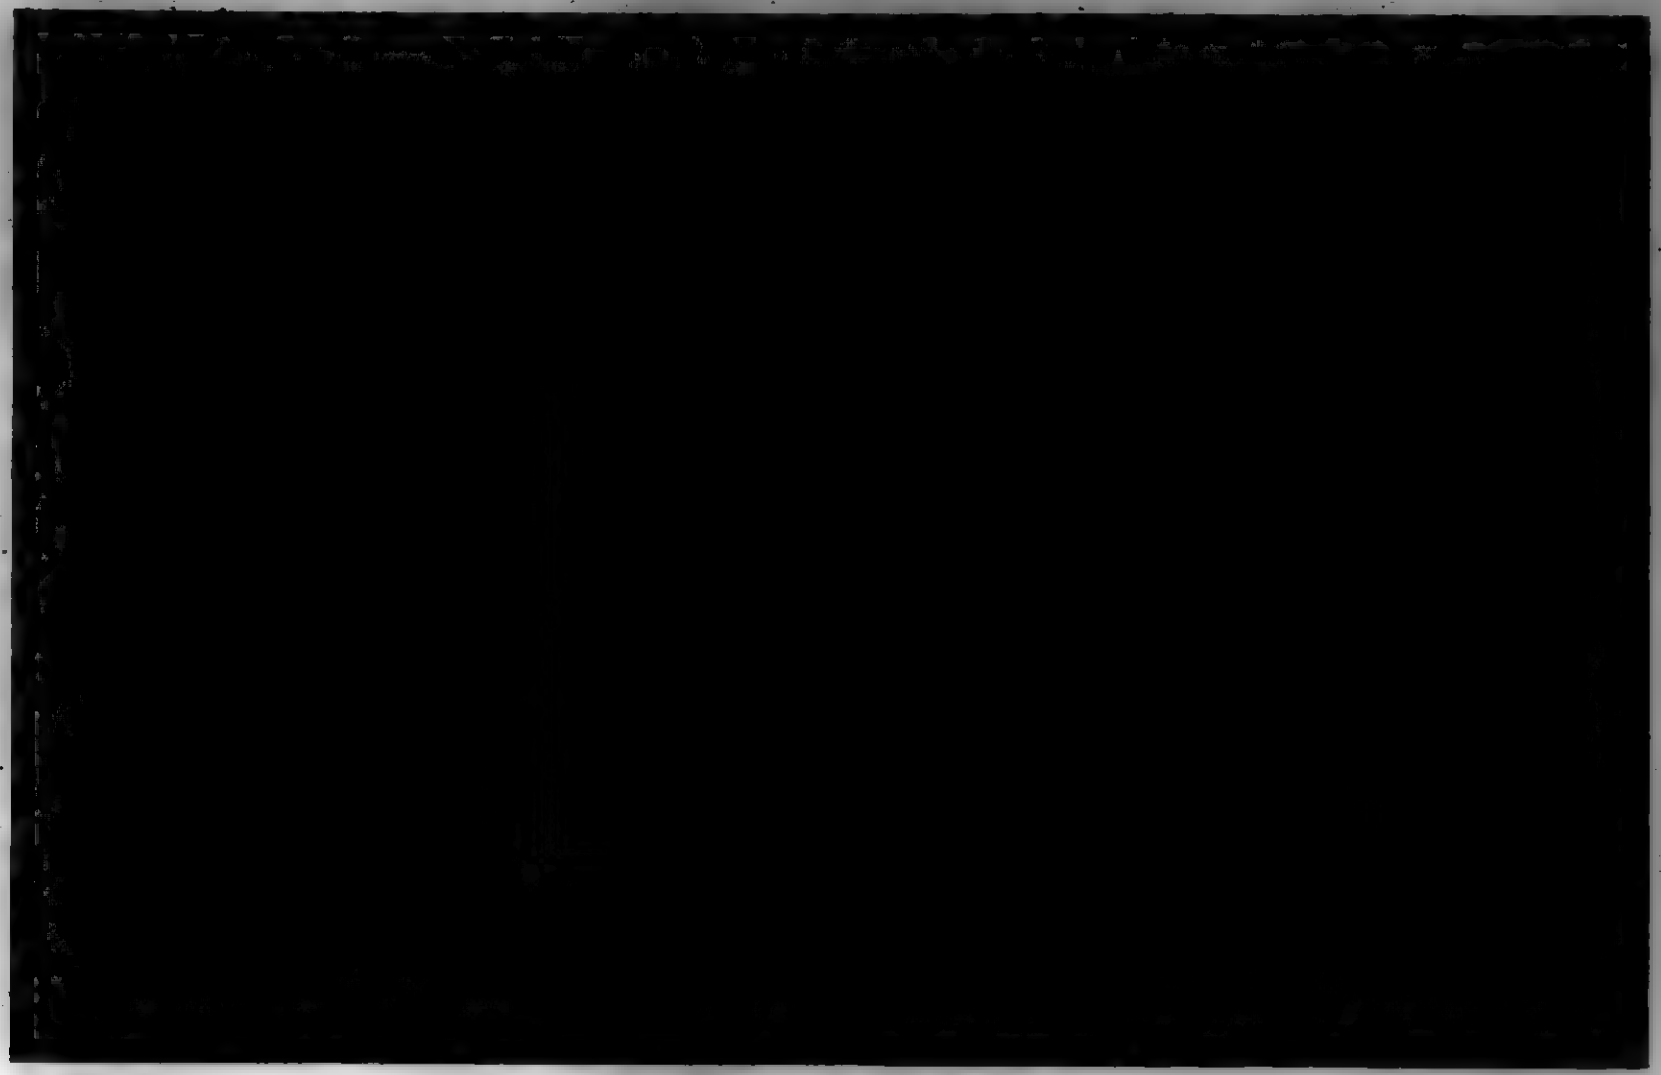
"The user can play with data," noted Stephen Murphy, data base manager and coordinator. Mapper was "designed as a one-way funnel from the data base, allowing the user to extract from the master file only and input to his or her own system." Murphy said that, unless otherwise authorized, a Mapper user cannot enter or delete information from the data base.

To encourage direct computer use by administrators, an orientation program to introduce computer usage was conducted. A demonstration of Mapper was included. This orientation occurred during the summer of 1982.

"Our objective was to build confidence to deal with the computer," recalled Carole Warren, manager of Application Support, whose job is to train users and, with Murphy, help them get their applications up and running. "They teach themselves," Warren said of users.

One such user is Henry Mau. Mau is the associate for University Financial Analysis and is in charge of monitoring a budget of some $70 million, of which 75% is allocated for salaries. "I had a general idea of how much each department spends on salaries, but I wanted to make it more responsive to individual transactions," Mau said.





The personal computer courted the workplace with endless promises.

A new era of problems was delivered instead. As MIS manager, you have observed: too many different brands of computers. Too many types of software. Software that's difficult to learn, limited and inconsistent in quality, and poorly backed up by manufacturers.

More troubling: there has been no way to control the information flow. No way to make these machines communicate with one another, or with the company's mainframe. No way to customize software to meet specific company needs.

Microcomputer chaos is likely to persist unless someone can bring in an effective system for managing them all, and introduce a measure of standardization.

That logical someone is you.

The logical solution is Visi On.™

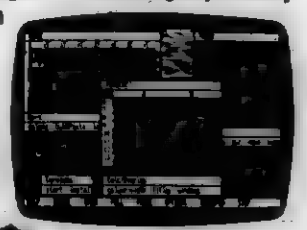
What's good for the user is even better for the MIS Department.

Visi On is not a new computer.

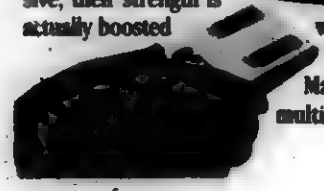
It is not a new computer program.

Visi On is a completely new generation of business software that harnesses the power of the personal computer; a microcomputer applications manager designed to work in tandem with the operating system of the pc, and integrate any number of application programs.

Initially, four applications are available: Visi On Word,™ Visi On Calc,™ Visi On Graph,™ and Visi On Query.™ Totally redefined for the Visi On environment, each application includes features and functions that have dramatically improved performance.



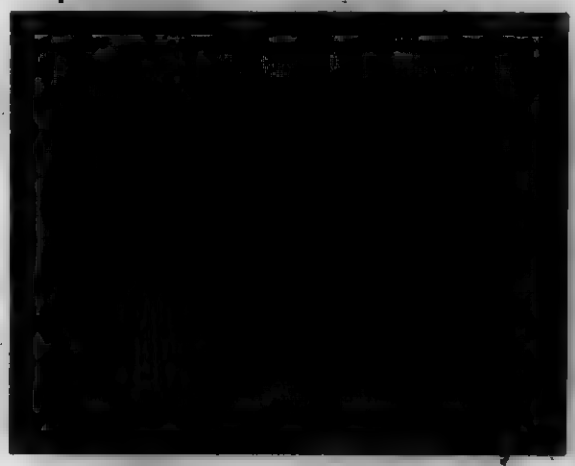
Even more impressive, their strength is actually boosted when these applications are *combined.*



Making maximum use of multiple electronic windows and a mouse, Visi On instantly transfers data between applications, demonstrating depth of integration to an unprecedented degree. Instead of doing just one job at a time, the user may move from project to project, backed up always by the full power of the machine.

And it's all remarkably simple. Visi On provides a single, sensible interface that makes every application easy to learn, and even easier to use.

There. Already it's getting quieter in your department...



ENTER VISI ON. Suddenly, every personal computer in your company becomes everything it ever promised to be.

Indeed, for MIS managers as well as for users, Visi On is a virtually instantaneous remedy for the problems experienced with personal computers.

Instantaneous? Yes. The system will work on most of the computers already in place. (Which also makes Visi On your simple-to-implement solution for standardizing systems and applications.)

On the off-chance a problem should befall a user, no problem. Each Visi On application program comes with the equivalent of 100 pages of Help text users may call on when there is a question. The more help the user gets from Visi On, the fewer the calls for help that come into your department.

The Visi On system also provides the basis for a complete package of communications programs. With applications software soon available, Visi On will allow personal computers to emulate both asynchronous and synchronous terminals.

And, Visi On will allow integration into local networks.

And more. In fact, it's endless.

Visi On is open-ended. New applications, capabilities and peripherals will be added. For developers of custom applications, a Visi On Toolkit™ is available. Want more information? Write Robert Fischer, VisiCorp, 2895 Zanker Road, San Jose, CA 95134.

And with all of the above, Visi On introduces a new generation of software support. It's the most comprehensive program ever executed for microsoftware. Backed up by VisiCorp,™ the number one name in business software.

Sit back. Be pleased with yourself. And if you're far too modest for that, simply rest assured that legions of formerly disgruntled users now have you to thank for an efficient, productive new partnership with their personal computers.

Your management thanks you, too.

You were, after all, the one who recommended Visi On.

VISI ON™

Visi On is now available for the IBM® Personal Computer XT, the Wang® Professional Computer, the Honeywell® Series 7000, the TI® Professional Computer, and the Compaq™ Plus.
Visi On, Visi On Word, Visi On Calc, Visi On Graph, Visi On Query and VisiCorp are all registered trademarks of VisiCorp.

Data base helps glassmaker peer into future

TOLEDO, Ohio — An online data base of economic and marketing information not only helped a major glassmaker avoid costly system development, it also currently highlights new sales opportunities nationwide.

From its headquarters here, LOF Glass, one of three divisions of the Libbey-Owen-Ford Co., directs five regional marketing operations. One of the keys to success for those marketing teams, according to Nate Condit, director of marketing research and planning, is to identify prime markets for LOF Glass products.

In the late 1970s, Condit said, glass manufacturing companies began to experience higher costs in moving glass from the factory to the market. In addition, escalating interest rates were having a depressing effect on the construction industry, which is a major market for the consumption of glass products.

Today the challenge for glass manufacturers, according to Condit, is to identify and precisely isolate new markets — to avoid the "scatter-gun" approach to marketing.

Condit and his staff first considered developing an extensive data base of national economic and demographic information, as well as models that could forecast patterns of growth and economic concentration. But it soon became clear that the project's costs were prohibitive.

"To develop in-house what we needed would have been quite complicated," he explained. "The staff it takes to establish and maintain such a project represents a heavy budget item. According to our estimates, new wage and benefit costs alone could easily have approached six figures a year.

"We also had to consider the difficulty of building an adequate data base, constructing accurate models and having time to test them. We also would have had to make provisions for keeping the data base up to date."

As a result, the marketing team began to look for an outside service that could provide the data and forecasting capabilities LOF Glass needed. What the team found, Condit said, was that most firms offered expensive, overly detailed models that provided more information than the firm needed.

After an extensive search, Condit finally discovered a service that offered the data and modeling techniques he really wanted: Control Data Corp. Business Information Services' X/Region Service.

The X/Region Service, according to Condit, is an online data base that provides economic and demographic data by geographic areas. The service contains data for all 50 states and the District of Columbia, 266 Standard Metropolitan Statistical Areas and 183 Bureaus of Economic Analysis. The data base contains historical data going back to 1970 across eight statistical categories, and the forecasted data extends through 1990.

Utilizing the X/Region Service, LOF Glass is able to track commercial and residential construction in pinpointed areas. The service aids in uncovering pockets of economic concentration in those regions where population shifts could be tipping off a new boom in construction. Accessing the service through a terminal in the marketing department, researchers can spot specific trends that may not be obvious, but which can have a major impact on regional and national sales.

"We needed accurate projections on what the future markets are going to be in given areas," Condit said. "Armed with this information, the company uses analyses and projections to develop new strategic marketing campaigns."

Publisher trims costs with move on-line

INDIANAPOLIS — Converting from an IBM-based batch processing system to an on-line system that could utilize specialized software for the publishing industry has reduced personnel and costs for a DP center here that manages various activities for four of the seven companies that comprise a major publishing conglomerate.

Until the new system was installed early in 1983, the central data processing center for ITT Publishing was overwhelmed by a mound of batch processing tasks requiring a library of 200 in-house programs with no standardization.

ITT Publishing's seven companies, located in six major cities, publish material that ranges from computer books to *The Joy of Cooking*. The centralized DP center here manages order processing, inventory, sales and accounting activities for four of the companies: Bobbs-Merrill Co. of Indianapolis and New York; R&R/Newkirk, Indianapolis; Marquis Who's Who, Inc., Chicago; and Howard W. Sams & Co., Inc., Indianapolis.

The DP center here previously employed an IBM 4241 with 40 IBM 3270 terminals. Forty-nine data processing personnel performed tedious daily inputting and batch processing of more than 3,000 pieces of written data from more than 150 users. "Because software applicable to the publishing industry was not available for the IBM equipment, our programmers wrote more than 200 programs for the various operations," DP manager Barbara Shrall recently recalled. "This made standardization impossible and broad modifications difficult."

The IBM system could have been expanded if the company had bought enough 3270 terminals to put all users on-line. But the projected costs for expanding and maintaining the existing system exceeded the industry average, and software availability would still be a problem.

Through a Phoenix software house, Computing Information Systems, Inc. (CIS), ITT Publishing purchased Ultimate Corp.'s packaged Honeywell, Inc. hardware and CIS software.

ITT Publishing has saved $1 million, half of its annual data processing operating costs, during the first year of operation, according to Carl Haynes, vice-president and group comptroller. He said half the savings came in personnel costs and the rest came from annual hardware, software and maintenance fees that totaled $750,000. Purchase of the Ultimate/CIS system, including depreciation benefits, costs about $225,000 to $250,000 a year, he added.

The central DP department was reorganized so that nine people now concentrate on program enhancements and on supervising the system's operation rather than on tedious data entry tasks. Most of the personnel who were employed with the old system were data entry workers, according to Shrall.

With the new system, approximately 115 users are on-line and can input and access data from any department in any of the four companies in the system. The companies outside of Indianapolis communicate with the central data processing center through 1200 bit/sec dedicated and dial-up leased lines.

The Ultimate/CIS system, in operation since January 1983, is built around two Honeywell DPS Level 6 processors and the Ultimate version of Pick and Associates, Inc.'s Pick operating system. Each processor has 1M byte of memory, and each runs three 288M-byte disk drives. Peripherals include 115 Ap-

TIS

"TIS™ is truly a remarkable software system. With TIS operating at both the Strategic and Tactical levels of our organization, we now have a sophisticated software system capable of evolving as the needs of the company evolve. As far as I'm concerned, TIS is giving Best Western International the kind of next generation technology we need."

—Keith Barlow

Best Western International is the world's largest lodging chain. In the fast-paced lodging business, total control of accurate and timely information is no luxury. It's a vital necessity. For this reason, Best Western demands advanced software that can grow as its needs grow.

The TIS Solution

After a careful evaluation of several systems, Best Western chose TIS—Cincom's powerfully integrated data base management and application development system and winner of the Associated Information Managers' (AIM) Outstanding Information Technology Award.

TIS was brought up quickly. It was first used in a Strategic capacity to implement corporate payroll and personnel applications. Now, TIS is being used in both Strategic and Tactical operations throughout Best Western International to develop applications for financial, marketing, supply and other functions. And, because the TIS Intelligent Query language provides easy access to corporate information, end-users are discovering that they can meet their own information needs without the aid of trained programmers.

TIS helped solve Best Western's immediate needs. More importantly, with TIS Best Western International now has a migration path to the future —with little concern for obsolescence.

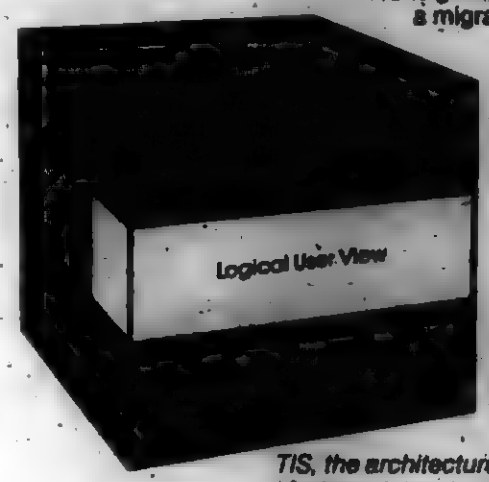
Modern Technology For Modern Needs

TIS is a totally integrated application development and information processing system. Its entirely new architecture is designed to meet a wide range of needs. Designed for complex, high volume data base environments, TIS provides:

- Full in-line integration, so that one system can be used to meet the needs of all users with unprecedented security and control.
- A relational view of data which gives programmers and end-users complete data structure independence.
- A powerful 4th Generation procedural language to serve requirements of both programmers and end-users.
- A new Data Manipulation Language so powerful only four commands are needed to handle even the most complex logical data base processing: GET, INSERT, UPDATE, DELETE.
- An Intelligent Query language to provide instant information to end-users for virtually all ad hoc needs.
- A new DBMS component that provides unique data structuring capabilities with high performance.

Check Into TIS For Your Company's Needs

TIS is giving Best Western International a migration path to the future. Isn't it time to find out what TIS can mean to the future of your company? For more information, or for answers to your specific questions, contact our Marketing Services Department, 2300 Montana Avenue, Cincinnati, Ohio 45211.



800-543-3010

(In Ohio: 513-661-6000)
(In Canada: 416-279-4220)

TIS, the architecture of the next generation of integrated data base technology.

ITT from page 37

plied Digital Data Systems, Inc. Viewpoint terminals and line-quality and matrix printers from Printronix, Inc., Data Products Corp. and Texas Instruments, Inc.

The customized CIS software includes applications for order processing; accounts receivable; inventory management; general ledger; royalties management; sales analysis; prospective customer list management; and subscription management.

"While our old system did provide centralized information, batch processing and data entry were slow and often delayed updating information," Shrall said. One of the major complaints Haynes received from managers concerned the department's very slow response in making program changes.

In June 1982, ITT Publishing signed a $750,000 contract with CIS for two Ultimate computers and customized CIS publishing software.

"We conducted the search on the assumption that reliable, high-quality software would dictate the use of equally reliable hardware," Haynes said.

The system's features include a relational data base manager and a dictionary-driven data retrieval language, Recall, that allows for easy data access. The operating system organizes files relationally so that data can be retrieved quickly and easily through random-access methods and includes other features such as a report writer, Shrall said.

"The major modification involved creating a menu screen that would accommodate the subsidiary companies' various ways of conducting order processing, inventory, sales managing and accounting," Shrall said. Distinct ways of operating similar departments in different companies are inevitable, and the system allows each company a choice by menu. "However, applications are standardized, and if broad modifications are necessary, it is a simple procedure," she said.

Little time was wasted on the conversion process. "Although the book says the two systems must be run in parallel testing and processing for some time, we had enough confidence in the Ultimate/CIS system through our own preliminary testing that we decided to bring up the new system as we turned off the IBM. We were successful, and there have not been any major problems with the system to date," Haynes said.

"The agreement provided the company's programmers with CIS source code so that we could further build on the software as our needs grew," Shrall said. Major enhancements to the CIS software since installation include the development of software for sales analysis; subscription and prospective customer management; accounts payable; cost accounting; and the building of a data base for information on semiconductor parts.

In addition, ITT Publishing purchased Ultimate's new 5X High Performance Processor enhancement to handle instruction execution, reduce the work load of the Honeywell central processors and increase the internal processing speed by a factor of five. Soon ITT users also will receive the Ultimate cache memory board that contains 4K bytes of high-speed memory and reportedly will increase system performance sevenfold.

Fast service, unlimited equipment selection, no red tape.

That's the Telecom Plus Difference.

And one of the reasons why we're one of the largest private telecommunications companies in the country.

Fast Service. Our computer-based service system speeds our response to your call. In an emergency we'll have a local service team at your office in less than an hour...

That's a promise!

Unlimited Equipment Selection. Because we don't manufacture, we're free to select the most suitable equipment for your business needs. With Telecom Plus you're not stuck with one company's products.

See the Telecom Plus Difference. Call us for a free survey of your telecommunications needs. To reach the Telecom Plus office in your area call Toll free 800-TEL-PLUS. Or send us your business card. Telecom Plus, 48-40 34th St. Long Island City, N.Y. 11101. Att: Marketing Dept. A.

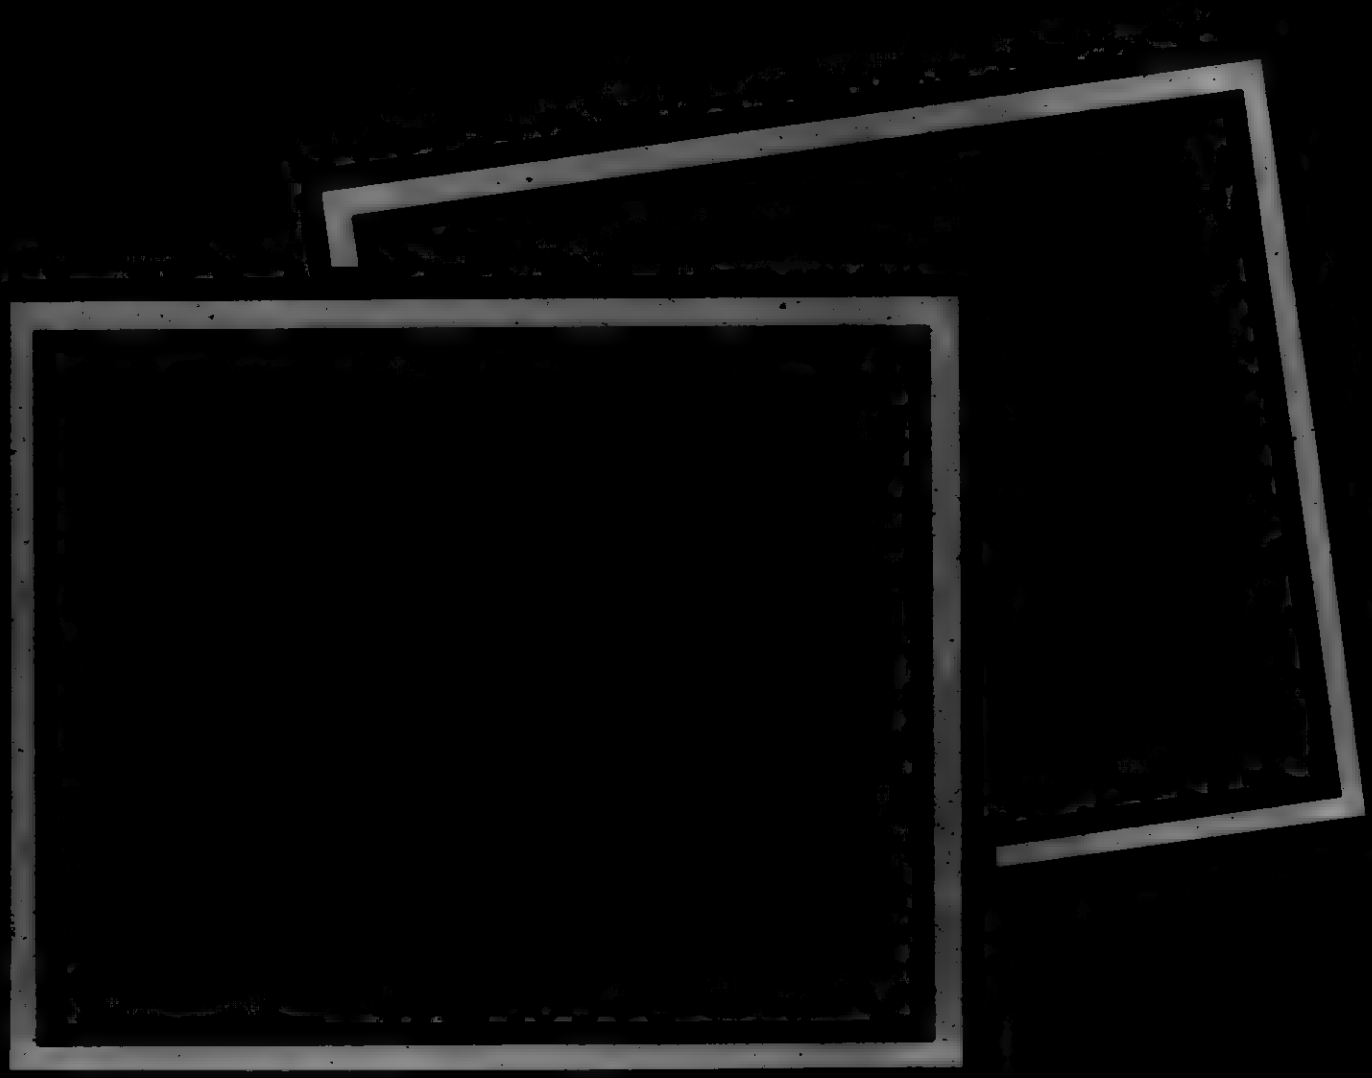
TELECOM PLUS™

Usus to hold conference April 13-15

SAN DIEGO — The UCSD Pascal System User's Society (Usus) semiannual national meeting will be held April 13-15 at the Hyatt Hotel at the Oakland International Airport.

Keynote speaker Susan Nycum, a lawyer specializing in high-technology issues, will discuss the legal issues of software protection. The meeting will also feature two tutorials (free to the public): "The p-System — How to Use it Better" and "Introduction to UCSD Pascal."

Registration prior to March 30 costs $25; registration at the door costs $35. Further information is available from Usus, P.O. Box 1148, La Jolla, Calif. 92038.



NEWS

Utility's DBMS builds modeling data base

ATLANTA — A major public utility here is using a relational data base management system (DBMS) to build a modeling data base that is shared by engineers, systems analysts and planners throughout the company.

Southern Company Services, Inc. is responsible for all major power plant modeling activities at four subsidiary companies: Alabama Power Co., Georgia Power Co., Gulf Power Co. and Mississippi Power Co.

James Dow, manager of information resources strategic planning for Southern Company Services, directed the development of a neutral — application-independent — structural modeling data base on the basis of criteria outlined by an in-house project team. "The initial concept was to identify and implement a relational DBMS which would allow us to approach plant modeling on a corporate basis," Dow explained.

"We wanted to create a data base environment allowing engineers and others to extract subsets from the data base and manipulate those files in a personal data management environment."

Dow's DP organization operates five Amdahl Corp. 470V/7 and 470V/8 mainframes interfaced to a series of IBM Model 4341s running under VM/CMS. In addition, three Honeywell, Inc. DPS 7 processors under Gcos and two Honeywell DPS/8 processors under Multics are linked to the IBM systems through a Honeywell-developed Multics-to-IBM link.

The firm also utilizes Calma Co.'s Dimension III and Applicon, Inc.'s Model 875 computer-aided design (CAD) workstations.

Relational DBMS chosen

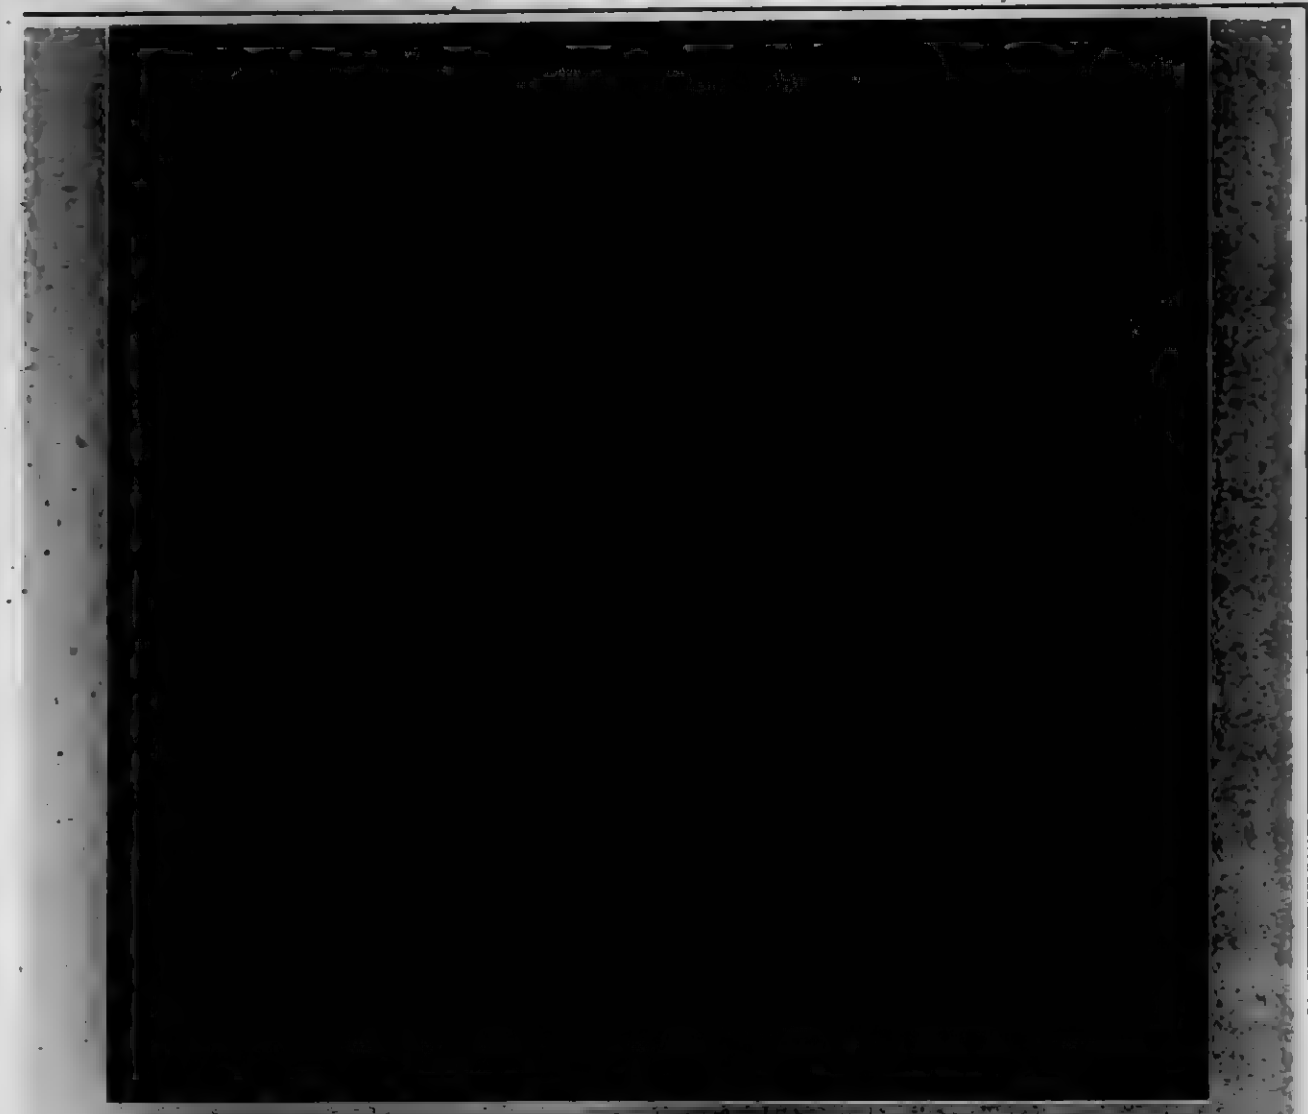
After careful review, Southern Company Services chose Boeing Computer Services Co.'s BCS RIM relational DBMS to maintain its structural modeling data base, which is used for finite element modeling such as the design of steel plates and beams. The BCS RIM system, which resides on the IBM processors, works in conjunction with Calma's graphics DBMS, McDonnell-Douglas Automation Co.'s Structural Design Language (Strudl) system and Sperry Corp.'s Graphics Oriented Finite Element Modeling System (Gifts) software.

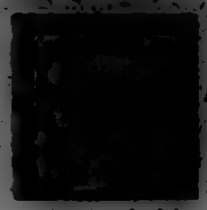
According to Dow, BCS RIM gives engineers the ability to maintain multiple copies of a model subset in a personal data base, on either a microcomputer or a terminal in a Honeywell time-sharing or IBM VM/CMS environment. The model subset copies can support multiple and perhaps conflicting design options under consideration. Once the design alternatives are analyzed, the best design is selected and posted back to the shared plant modeling data base.

"The process involves data capture and maintenance using our Calma automated drafting system," Dow explained. "We accomplish the data capture operation with Calma, and pass the model to Strudl for analysis on our mainframe computers. We bring the output from Strudl and pass it directly to the RIM neutral structural model for storage and post-processing."

Dow said the project goal was to establish a link between Strudl, which operates on the Amdahl processors, and the firm's various applications systems, including the Calma and Applicon CAD systems and Gifts.

In a typical application, he explained, an engineer might generate design geometry using the Multics-based Gifts software, use it to create a RIM data base, transfer the RIM data base to the Amdahl system, run an application to generate a Strudl input deck and perform analysis.





"The integrity of Formica Corporation is very important to me. When we promise rapid delivery, we return it," reports Gordon Sterling, President. "American Software's Sales Forecasting system helps us keep our promises and maintain a high level of customer service by more effectively managing our inventories. Our investment in American Software's Sales Forecasting system has more than paid for itself... and I look forward to even more savings in the future."

American Software can provide you with proprietary software packages for Sales Forecasting, Purchasing, Inventory Management, and Materials Management. Plus extensive consulting help, and the training you need for successful implementation.

American Software: The Power of The Right Decision.

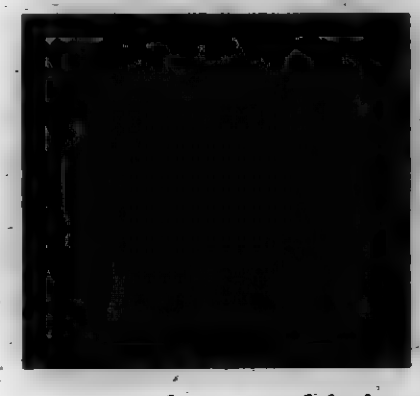
Keeping Formica Corporation On Top

AMERICAN SOFTWARE

443 E. Paces Ferry Rd., Atlanta, GA 30305 (404) 261-4381

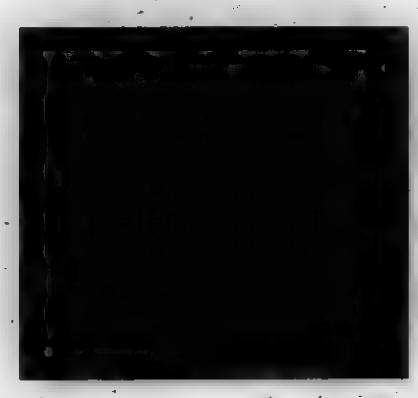
It's just not fair to claim that TEMPLATE® is the best graphics software available. Our competition's already discouraged.

And we like competition. We really do. It's just that it's difficult, if not impossible, to find graphics software as efficient and functional as TEMPLATE. Try as you might. TEMPLATE is the hands-down winner. With true device-independence and intelligence, total graphics functionality for CAD, scientific analysis, seismic work, process control, molecular modelling, and a host of other applications.



In almost any environment, whether it's batch or interactive, 2D or 3D, TEMPLATE wins. Benchmark tests prove it. TEMPLATE, besides being a true 3D graphics package for 32-bit or larger computers, features powerful commands that provide matchless productivity. TEMPLATE makes optimal use of available computer resources, giving you fast, efficient computer graphics program execution. And it supports over 125 graphics devices, from dumb terminals to sophisticated systems.

We also provide on-site installation and training, continuous updates, a regular flow of new device drivers, and ongoing documentation. What's more, we back you up with a telephone hotline so TEMPLATE software specialists can provide help if you need it.



But let's be fair. If you're looking for graphics software, call our competitors first. Find out what they have to say about theirs. Then call us, and find out why TEMPLATE really has no competition.

And why the competition has been so discouraged for so long.

Generator cuts firm's coding time in half

FRESNO, Calif. — Success often creates as many problems as failure. As Paragon Industries, Inc. — a building wholesale and retail firm headquartered here — grew, its automated accounting application became outdated.

The company faced a common dilemma. Designing an accounting package from scratch was expensive, but off-the-shelf packages did not have the features that the company needed.

A program generator solved the dilemma. Paragon could develop its own accounting application but not have to take the time to write all the code from scratch.

Before deciding to buy a program generator, the company looked at a number of packages. "Each package contained bits and pieces of what we needed, but no package met all our needs," according to Sandra Gaines, DP manager.

The reason, she explained, is that most retail outlets measure stock in item quantities; Paragon accounts for its tile by the square foot (or square meter in the case of imports), its grout by the pound and its pipe by the linear foot. Moreover, the accounting system had to calculate three pricing structures — retail, contractor and dealer — as well as discounts for quantity purchases.

In 1982, the company replaced its Alpha Micro, Inc. microcomputer with a microcomputer system from Wicat Systems, Inc., which can support 16 users and has a 474M-byte hard disk. The Alpha microcomputer was unable to handle the growth of Paragon, which had added five stores: four in California and one in Nevada. "Just tracking inventory in six stores would have exhausted our 100M-byte disk capacity," Gaines said.

The company's accounting application was outdated as well. It consisted of several independent modules that required duplicate entries.

Cobol program generator

Paragon's hardware limited its selection of program generators. "We looked at a number of packages, but none ran under Wicat's proprietary MCS operating system," Gaines said. "Bytel Corp. was the only company willing to port its Cobol program generator, Cogen, to that operating system. The vendor worked out the programming specifications and informed us when the migration was finished."

Using Cogen, Paragon coded order entry, accounts receivable and inventory programs in two months. "Without Cogen, coding would have taken at least four months," Gaines claimed. "The program generator did tedious work, such as counting spaces for screen layouts, that no programmer wants to do. Consequently, writing specifications becomes time-consuming, but coding is relatively fast."

Gaines used the generator to produce screen, report and file frameworks, which Paragon customized. "We were using the program generator the morning it arrived," Gaines said. "Applications are menu-driven and easy to use; it takes only 15 minutes to generate a screen module."

Installation problems were minor. "Cogen screens were smaller than our screens," Gaines said. "We had to squeeze our data onto the screen. Bytel personnel told us that a Cogen enhancement should solve this problem. Another problem was function-key syntax. Certain keys have unique uses that were difficult to remember. Templates helped solve this problem," she explained.

While Paragon's accounting needs are not common, they are not unique either, and some of Paragon's customers expressed interest in its package.

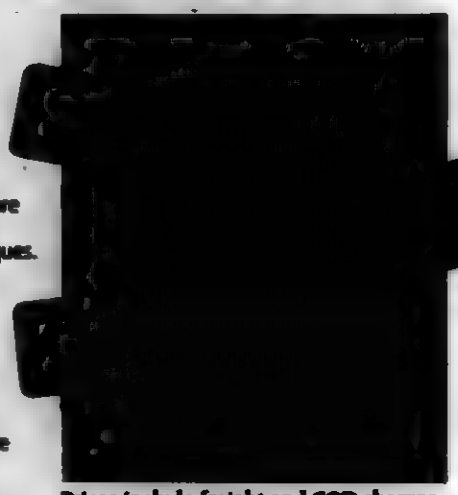
5 Day Delivery!

Paradyne 2,400, 4,800, 9,600 BPS CHALLENGER Modems

Call 1-800-482-3333 and Paradyne will send your modems COD to be delivered at your site, anywhere in the continental U.S., within just 5 days! Paradyne's CHALLENGER Series high performance modems are state-of-the-art technology using advanced signal processing techniques.

Installation is Fast and Easy. You can install these modems yourself! Plug in the modem, follow a push button configuration procedure, attach your DTE connection and the modular jack, connecting the modem to your 4-wire leased phone line. You're ready to go!

High Performance Backed With Paradyne Reliability. All three models operate in either point-to-point or multipoint applications. An optional four-port buffered multiplexer is available for the 4800 and 9600 models. And the Series has a calculated mean time between failure of more than four years.



Prices include freight and COD charges.

State-Of-The-Art VLSI Technology. Front panel soft strapping configuration is easy and each modem has automatic, adaptive equalization at all speeds, including 2,400 bps.

If You Need Modems NOW, Order Direct From The Manufacturer — Call 1-800-482-3333 or mail in your order. In Florida please call 813-530-2516. Delivery time and price discounts for large quantities available on request. Multiplexer option available at additional cost. Dealer inquiries invited. The new CHALLENGER Series...a challenge to the modem industry offering quick delivery at prices below what you normally would expect to pay...only from Paradyne.

1,200 BPS Modem. Also available for 5 day delivery is the DTU 1200D, a 212A compatible full duplex dial modem. This 1,200/300-bps modem features automatic dialing, CRT prompts and automatic test capabilities and sells for $655 including freight and COD charges.

WHEN IT COMES TO SOLVING BUSINESS PROBLEMS, ONE COMPANY IS A MILLENNIUM AHEAD.

Although we'd all like our business problems to fit into neat little compartments, they never seem to want to go there. Take a simple general ledger variance in your New York office. For some strange reason, it connects to a large office supplies transaction in London, which really turns out to be an erroneous distribution of a capital equipment expenditure to Peoria through your accounts payable system.

A business person can only unravel such mysteries by opening his or her mind and following the trail wherever it leads. Using business software to help.

But is your software giving you the help you really need?

Several years ago, a team of McCormack & Dodge researchers uncovered a remarkable paradox:

Business problems don't fit into compartments. Yet even the most sophisticated software packages operate on the principle of compartmentalization. In the very same vendor product line, you find general ledger packages designed one way, accounts payable another, fixed assets yet another. In actual use, these separate designs become separate walls. Barriers to problem-solving.

Even though your mind wants to move freely from one system to another, roadblocks hold you back.

Because McCormack & Dodge researchers identified this paradox first, we are years ahead of the industry in overcoming it. Our Millennium series is designed and built, from the ground up, as a genuinely borderless product line. A true family of systems in which the whole works as smoothly as any part, making the most efficient use of all your data processing resources.

With Millennium, and only with Millennium, a business person asking a question in one system can instantly enter a correction in another, seek an answer in a third, update a fourth—and move with total freedom through the entire vast information universe.

When it comes to solving business problems, McCormack & Dodge is a Millennium ahead. Shouldn't you be too?

WHEN YOU THINK ABOUT TOMORROW, MILLENNIUM MAKES SENSE TODAY.

Conference to focus on bypassing access charges

CRYSTAL CITY, Va. — A conference and exhibition for telecommunications professionals titled "Bypassing Access Charges" will take place Feb. 28-29 at the Hyatt Regency Hotel here.

The conference will focus on "the timing and impact of the bypass options available today as the only challenge to unfair or 'loaded' access charges," according to conference sponsor Telestrategies, Inc.

Mark S. Fowler, chairman of the Federal Communications Commission, will discuss "New Telecommunications Services and Local Telephone Bypass: The FCC Perspective," as the featured speaker at the Feb. 28 luncheon.

Twenty other speakers from private industry and government will address a variety of telecommunications topics.

The exhibition will feature such technology and services as private, high-speed, digital microwave; satellite transmission; two-way CATV; fiber optics; digital termination systems; and cellular, mobile radio telephone.

A day-long, preconference seminar on "Applying Bypass Technologies to Reduce Access Charges" will be conducted Feb. 27 by Dr. Jerome Lucas, president of Telestrategies.

Registration for the preconference seminar is $495. The two-day conference costs $795. Registration for the seminar and conference costs $1,095. Group discounts are available.

More information is available from Telestrategies through P.O. Box 1218, McLean, Va. 22101.

Cincom meet to explore new tech

CINCINNATI — "Keeping Your Organization on the Leading Edge of Software Technology" is the theme of Cincom Systems, Inc.'s Technical User Conference to be held here March 4-8. The conference will feature presentations by Cincom personnel, introduction of new products and more than 35 classes.

Advanced class offerings will focus on the latest developments in major Cincom products including TIS, Ultra, Manufacturing Resource Planning System and Mantis.

The cost of the conference is $825 per person. Cincom is located at 2300 Montana Ave., Cincinnati, Ohio 45211.

IDC slates briefings in six cities

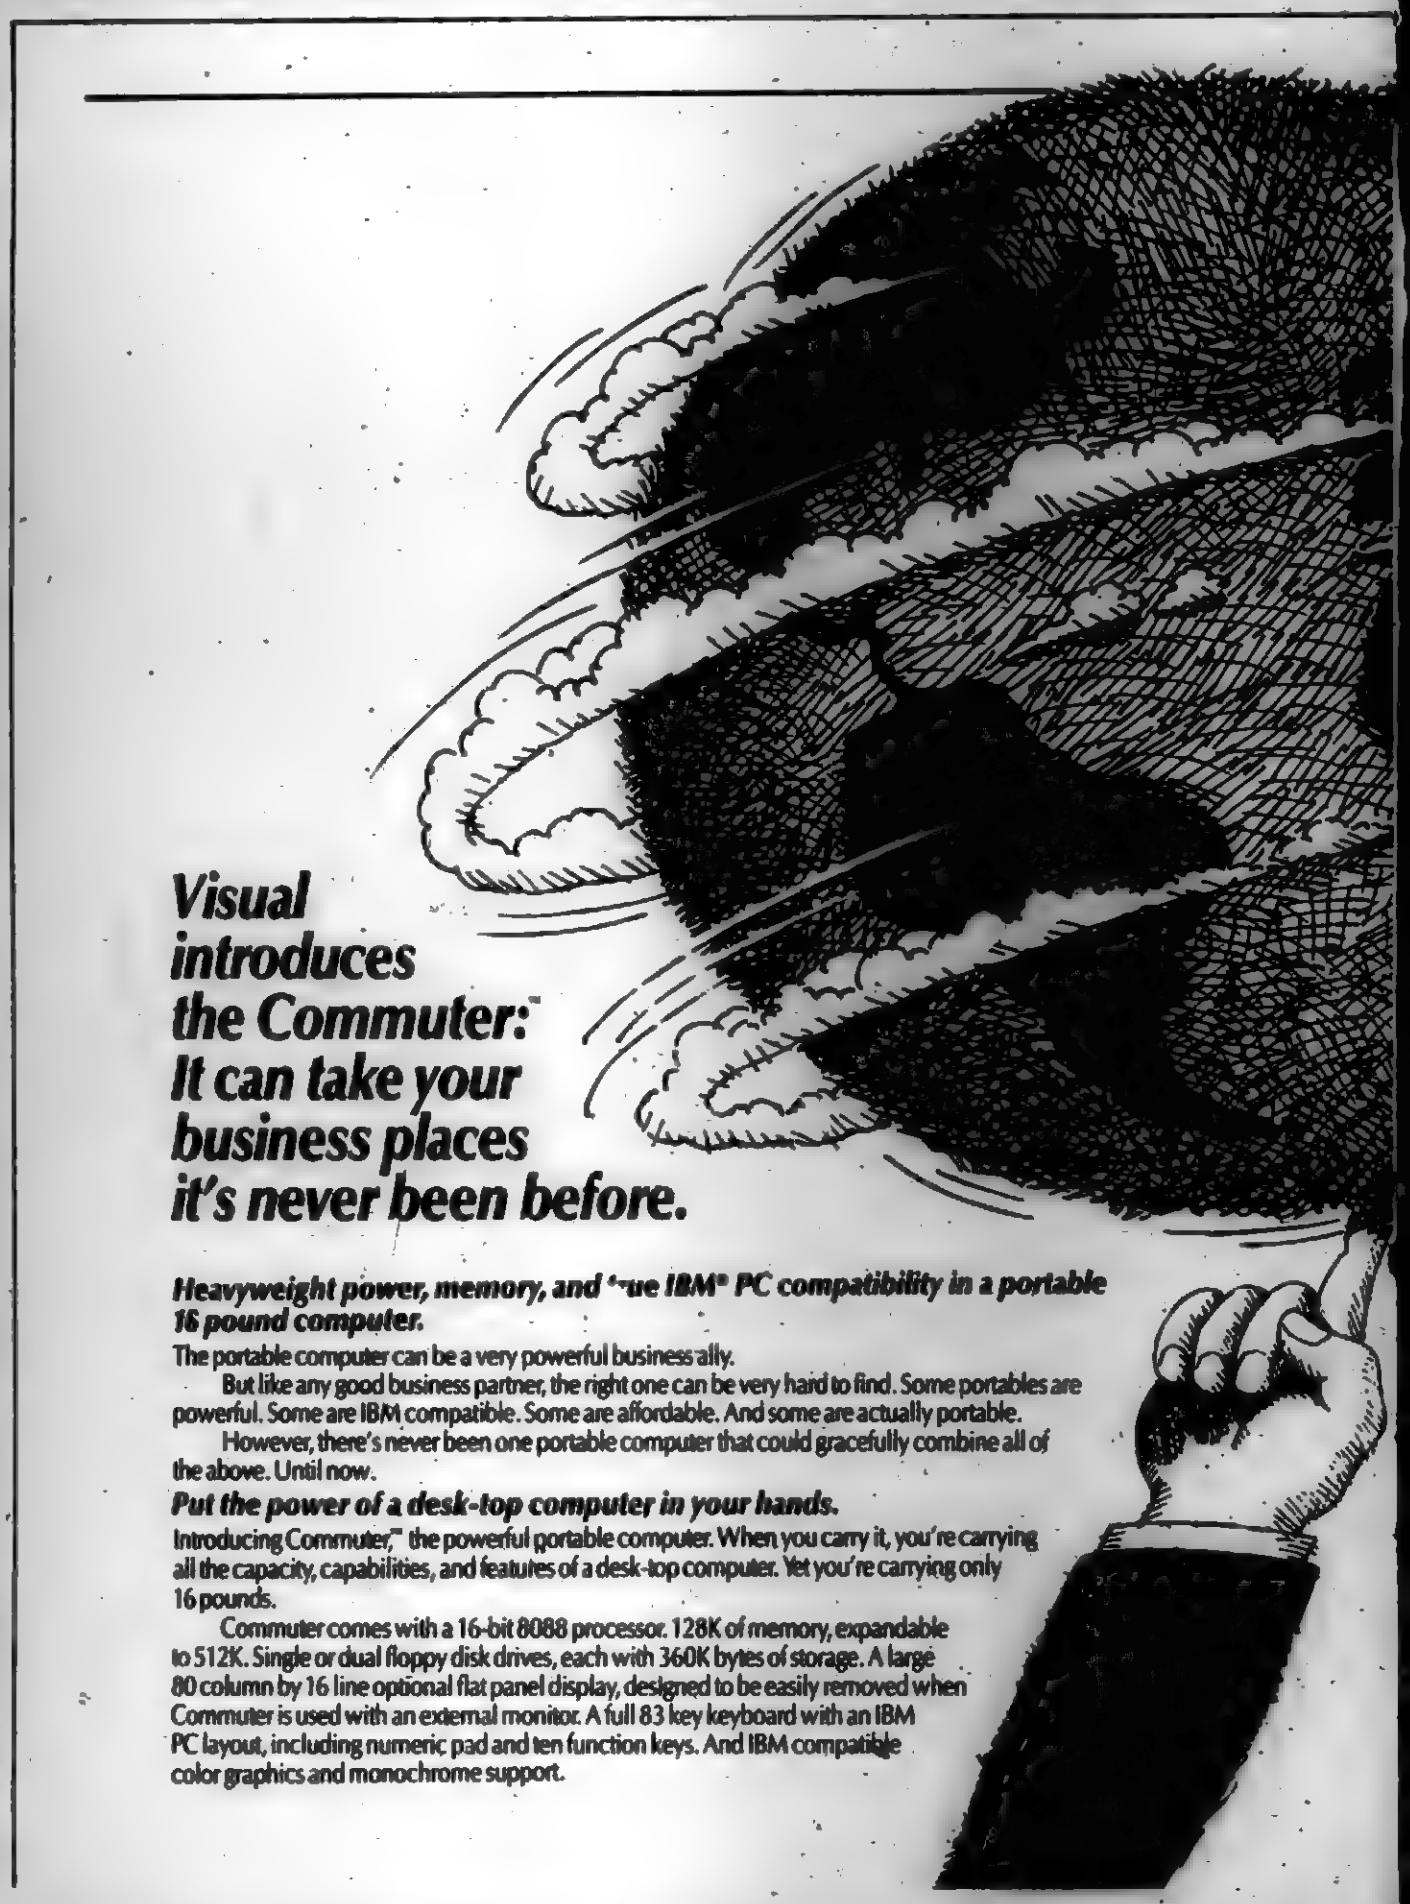
FRAMINGHAM, Mass. — International Data Corp.'s (IDC) 19th annual one-day Information Industry Briefing Session will focus on integrating microcomputers with mainframes when it is held in six cities in early March.

Scheduled topics include a technology update for 1984 and how users perceive micro-to-mainframe connections.

The seminar is scheduled March 2 at Boston's Copley Plaza Hotel; March 5 at the Crystal City Hyatt Regency in Washington, D.C.; March 7 at Chicago's O'Hare Hyatt Regency; March 9 at the Lincoln-Radisson in Dallas; March 12 at the Los Angeles Airport Hyatt; and March 14 at the Red Lion Inn in San Jose, Calif.

The briefing session costs $475 for one person and $395 for each additional attendee from a company.

IDC is located at Five Speen St., Framingham, Mass. 01701.



Visual introduces the Commuter:™ It can take your business places it's never been before.

Heavyweight power, memory, and true IBM® PC compatibility in a portable 16 pound computer.

The portable computer can be a very powerful business ally.

But like any good business partner, the right one can be very hard to find. Some portables are powerful. Some are IBM compatible. Some are affordable. And some are actually portable.

However, there's never been one portable computer that could gracefully combine all of the above. Until now.

Put the power of a desk-top computer in your hands.

Introducing Commuter,™ the powerful portable computer. When you carry it, you're carrying all the capacity, capabilities, and features of a desk-top computer. Yet you're carrying only 16 pounds.

Commuter comes with a 16-bit 8088 processor. 128K of memory, expandable to 512K. Single or dual floppy disk drives, each with 360K bytes of storage. A large 80 column by 16 line optional flat panel display, designed to be easily removed when Commuter is used with an external monitor. A full 83 key keyboard with an IBM PC layout, including numeric pad and ten function keys. And IBM compatible color graphics and monochrome support.

Ross Gear shifts to automatic with CAD

LEBANON, Tenn. — A computer-aided design (CAD) system is helping to slash the time spent in designing tooling for manufacturing trucks at the Ross Gear Division of TRW, Inc. here.

Ross Gear produces steering gears at three locations for such heavy-duty truck customers as Ford Motor Co., General Motors Corp., Mack Trucks, Inc. and International Harvester Co. Prior to 1982, its process planning and tool design work was not automated, although the company said it had been considering doing so for a number of years.

Ross Gear first began to consider automating its tooling design work in 1979 in hopes of increasing productivity and improving the quality of work, according to Michael Russell, manager of manufacturing engineering at the plant here. "We were looking for something that would integrate into the total product design in every area and that would give a common data base that could be accessed simultaneously by the product engineer, the process engineer and the tool designer," he added.

After examining systems from a half-dozen major corporations offering computer graphics systems, Ross Gear chose IBM's Computer Augmented Design and Manufacturing (Cadam) system. The integrated graphics system enables users to draw geometric designs on a display terminal; the drawings can be stored and retrieved and used in manufacture of the product.

[illegible]

Cadam was chosen in part because it was one of two systems at the time that could link up all the plants and the headquarters under one mainframe, according to John Shaw, division chief engineer for technical services at the Lafayette, Ind., headquarters. "Since they both used IBM hardware, we decided to go fully IBM and chose its Cadam," Shaw said.

The system, installed over a six-month period in 1982, includes a 4331 mainframe, three 3258 and six 3256 controllers and 12 Model 3251 monochrome graphics workstations. Because of the system, product quality has improved significantly, Russell said, explaining that engineers can calculate the manufacturing tolerances of moving parts better than they could by hand. Specifically, with the Cadam system, engineers do in minutes, with greater accuracy, detailed design functions that previously took hours to do on a drafting board.

The system here is part of a Cadam network linking three Ross Gear locations. Gears are designed in Lafayette and produced in plants located adjacent to the Lafayette headquarters and in Lebanon and Greeneville, Tenn. The Cadam systems are connected by high-speed telephone lines to the IBM 4331 central computer in Lafayette, which transmits designs to the other locations.

"We can all look at the design displayed on a terminal in each location, make suggestions and know what each other is talking about," Shaw said.

In the year that Ross Gear has used the system, productivity has jumped noticeably. "Engineers can create twice as many new gear designs as before and can redesign three times as many existing gears with the system," Shaw noted.

As an engineering tool, according to designer Jerry Garrett of the Lebanon plant, Cadam is one of the best he's seen. "It's 10 times more accurate than anything you could do by hand," he said. Garrett uses a light pen to draw tool designs directly on the computer's terminal screen.

VISUAL
Visual Computer Incorporated

While Commuter is powerful enough to stand alone, it can really grow on you. Because Commuter also features built-in ports for adding printers, hard disk, communications, external monitors, and your television set. Even a built-in port for adding the IBM expansion chassis.

IBM® PC compatible. And downright sociable.

Many portable computers today call themselves IBM compatible. But before you buy one, ask if it can run IBM PC software. Business programs like Lotus®1-2-3,™ VisiCalc™ or WordPlus-PC.™ Exciting games like Flight Simulator.™ Or educational games from Spinnaker.™ You'd be surprised at the answers. But not with Commuter. In fact, think of it as an IBM PC to go. The IBM PC styled keyboard is only the start. Commuter comes bundled with the MS-DOS™ operating system and GW Basic.™ And at 5¼", Commuter's double-sided double-density diskettes are directly transferable to and from the IBM PC. So you can take advantage of the hundreds of business accounting, word processing, financial planning and other software packages available for the IBM PC. Without having to modify a thing.

At $1,995 and 16 pounds, it's never been easier to pick up a portable computer.

At 15"x18"x3½" with built-in handle and carrying case, the Commuter can go anywhere a briefcase can. It fits easily under an airplane seat. Because it weighs just 16 pounds (about half the weight of other portables in its class), Commuter is very easy to handle. And its $1995 price can save your business a small fortune even before you pick it up.

For more information on Commuter, the portable computer, call us today at 1-800-847-8252 (in Massachusetts, call 1-800-462-5554), or write Visual Computer Incorporated, 135 Maple St., Marlboro, MA 01752. Or visit your local Commuter dealer and weigh the differences for yourself. But hurry. At only 16 pounds and $1995, Commuters are definitely going to be picked up fast.

Commuter. It can take your business places it's never been.

Interface '84 scheduled for March 12-15 in Las Vegas

LAS VEGAS — Interface '84, the 12th annual conference and exhibition for data communications, data processing and MIS professionals, will be held March 12-15 at the Las Vegas Convention Center here.

More than 200 industry experts are scheduled to speak at Interface '84. Conference sessions and papers will cover such topics as the impact of the AT&T divestiture, information management, network optimization, digital private branch exchange growth, local-area networks and network software, according to a spokesman for the conference.

The exhibition will include more than 1,200 exhibit spaces featuring data processing products and services.

The conference is being produced by The Interface Group, Inc. and co-sponsored by *Business Week* and *Data Communications* magazines.

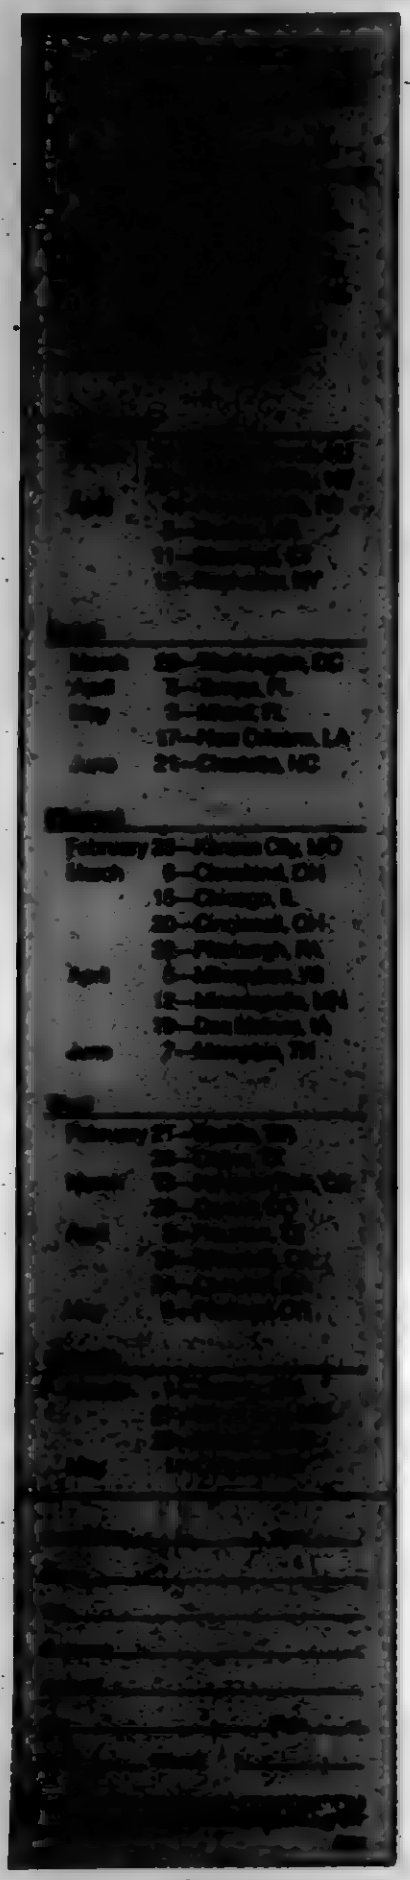
Tickets for the four-day conference are $325. One-day conference tickets cost $125. Tickets to the exhibition only are $25.

Industry awards banquet

For an additional $45 per person, attendees can purchase tickets to an industry awards banquet to be held in conjunction with Interface '84. Limited seating is available. Banquet tickets must be reserved and prepaid by March 5 to guarantee preferred seating.

Special hotel accommodations and airline fares are available.

More information is available from The Interface Group, which is located at 300 First Ave., Needham, Mass. 02194.



THERE'S ONLY ONE UFO.

A lot of software suppliers are trying to fit into UFO's shoes these days. They'll try to tell you that their On-line Application Development Systems are as powerful...as proven...and as accepted as UFO. They'll try to persuade you that they can offer you UFO's dramatic reduction in the time and expense of developing your CICS and IMS/DC applications. That's what they'll try to tell you. But the revealing and indisputable fact that UFO now has more than 1,500 installations ...more than all other independent suppliers combined...is your absolute proof that there's only one UFO.

No other On-line Application Development System can match UFO's speed, performance and cost savings.

UFO helps you melt away your programming and maintenance backlogs by eliminating the prime source of inefficiency in the application development process...repetitive coding. Pre-programmed and pre-tested functions like..."add, update, copy, browse, and display"—are initiated by keying in simple commands. There's no complex new language to learn, no code to write. Even access to your DL/1 database requires no special database training. With UFO, all your programmers can quickly become CICS or IMS/DC application development specialists without extensive and expensive training.

Because UFO is a non-procedural system, the time required to initiate new programs is dramatically reduced. Your programmers are guided through the development process with a free-form screen PAINTing facility, data dictionary, menu assistance and help screens. Simple fill-in-the-blanks techniques focus activity on what's to be done, not how to do it. And applications can be developed interactively with end-users, permitting changes at the prototype stage for guaranteed end-user satisfaction.

If you're concerned about reducing the time and cost of developing, maintaining and securing on-line applications...call in the best. UFO...User Files On-Line...from Oxford.

NEWS

Bank trims microfilm costs with switch to dry COM

SAN FRANCISCO — By converting much of its computer output operation from a mix of paper printers and wet computer output microfilm (COM) to dry, on-line COM devices, Wells Fargo Bank here reportedly slashed more than $250,000 from its annual tab for generating some one billion lines of microfilm per month.

As a result, the organization is now better positioned to generate reports and information in a timely manner, according to Reuben Barrera, an analyst at Wells Fargo here.

"Management wanted us to develop a plan to use COM effectively during the 1980s," Barrera said. "Three fundamental goals sum up that plan. First, we had to accommodate increased COM usage. Second, we had to cut costs. Third, we wanted to take advantage of the latest technology [in order] to attain goals one and two."

Much of the impetus for increased COM usage stemmed from the fact that, prior to the conversion, the bank generated as much output on six laser nonimpact printers as it did on its four wet COMs. Yet it did this at a substantial premium: The nonimpact printers cost three times as much as the COM equipment, and supplies cost four times as much.

More effective way needed

Growth projections and economics dictated that a more effective way be found. With added use of paper printers ruled out, the basic avenues open to the bank were to continue with the wet COM technology or upgrade to more current dry technology — laser COM devices — available in either on-line or off-line configurations. Dry COM eliminates the chemical handling and processing required with wet COM.

In late 1981, Wells Fargo began to compare the advantages of adopting dry COM technology to that of adding more wet COM units and found that the dry technology would cost at least $20,000 a month less to operate. For the comparison, the bank used an Eastman Kodak Co. Komstar 200 microimage processor — a device that uses a laser-imaging method — and heat-processed microfilm.

In addition to cost, a number of other factors weighed against wet COM:

■ Personnel requirements differed sharply between the two technologies. With wet COM, it was estimated the bank would have to hire up to five more COM operators in 1982 alone. "We had problems keeping a full staff due to high turnover," Barrera said. "Given the special skills needed for wet COM operators, it became a difficult challenge to train staff continually."

■ The costs of wet COM production would grow almost proportionately to the increase in volume. Waste could run as high as 50% some months due to tape problems causing reruns and processing control. "We simply needed to find a way to improve productivity," Barrera said.

■ The bank's tape library was bulging with tapes needed for wet COM processing. Some regular COM jobs created 120 magnetic tapes each time they were run; with the volume of COM jobs rising, so would the number of tapes.

After selecting dry COM technology, the bank had to choose between an on-line and off-line configuration as well as the vendor that could best meet its objectives.

The need to control tape usage favored on-line COM. "Perhaps the biggest factor in favor of on-line COM was the need to integrate COM operations into the mainstream of the DP output operation," Barrera said.

When the bank compared the Komstar 200 with other on-line op-

CCA EMACS

The most complete screen editor available for Unix[1] and VAX/VMS[2].

CCA EMACS from Computer Corporation of America has the greatest combination of power, speed, and funtionality of any text editor available for Unix or VAX/VMS. With close to 400 built-in commands, CCA EMACS allows virtually any editing task to be accomplished in just a few keystrokes, including tasks that would be difficult or impossible to do using other editors. In addition, a set of more than 80 predefined variables allows each user to customize CCA EMACS to meet various application needs and user styles. All of these features are supported by a full online documentation package that can assist the user at any point, giving information that ranges from the definition of a single command to manual pages that contain complete explanations of major CCA EMACS features.

Operating Environment

Runs on Berkeley Unix (4.1BSD and 4.2BSD), Bell Unix (System III and System V), and VAX/VMS. Requires 500 K of address space.

Price

Prices for a full source license range from $360 to $2400. Contact CCA for further details.

For More Information Contact

Computer Corporation of America, Four Cambridge Center, Cambridge, MA 02142 (617) 492-8860

OEM inquiries are encouraged.

Videotex meet set

ROSSLYN, Va. — "Forum on Unauthorized Access," a 1½-day conference, is scheduled for February 28-29 at the Hyatt Arlington Hotel here.

Sponsored by the Videotex Industry Association (VIA), the forum will look at enforcement, legislation and public awareness of unauthorized access to videotex systems. George M. Minot, senior vice-president of Compuserve, Inc. in Columbus, Ohio, is the forum chairman.

Attendance is limited to 72 people. The cost is $395 for VIA members and $695 for others. VIA is located at Suite 200, 1901 N. Fort Meyer Drive, Rosslyn, Va. 22209.

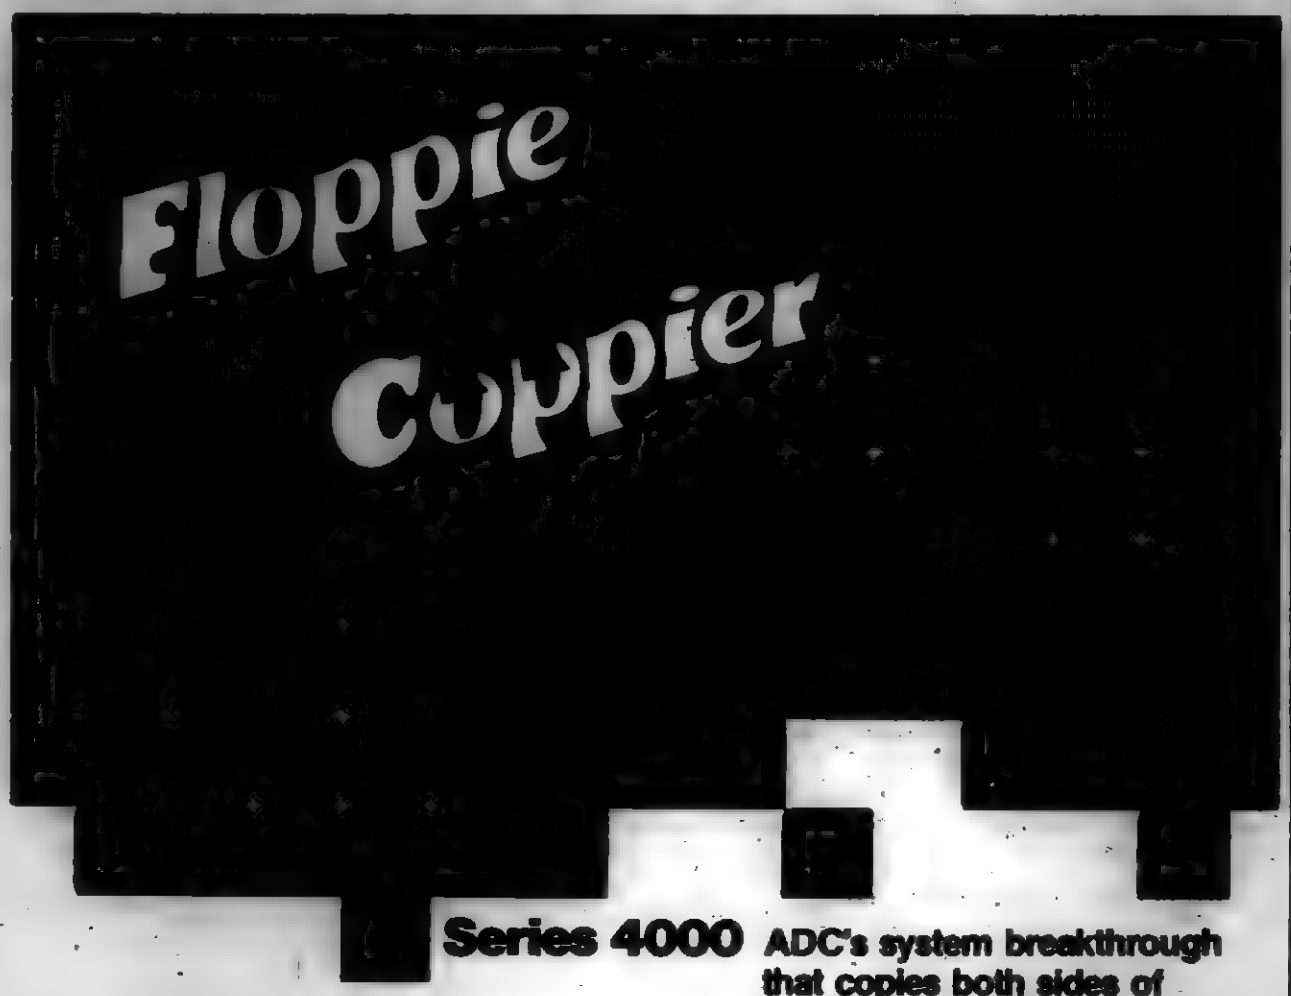
Feb. 23 seminar to cover AI trends

SCOTTSDALE, Ariz. — DM Data, Inc. has announced a one-day Artificial Intelligence Trends '84 Seminar here on Feb. 23.

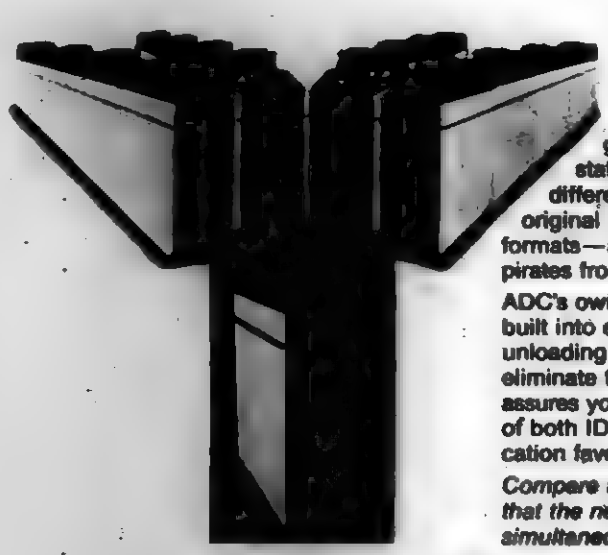
Howard Dicken, president of DM Data, will discuss the present market and the companies actively engaged in the five major categories of AI: expert systems, visual, recognition, computer-aided instruction and natural language software. He will discuss current trends and future markets and products.

Also scheduled is Dr. Nicholas Findler, research professor of computer sciences and director of the Group for Computer Studies at Arizona State University, who will discuss the basic fundamentals of AI and potential applications.

The seminar fee is $325, which includes luncheon and class notes. Further details are available from the seminar secretary, DM Data, Suite 700, 6900 E. Camelback Road, Scottsdale, Ariz. 85251.



Series 4000 ADC's system breakthrough that copies both sides of double-sided diskettes at once!



Just as efficiently and smoothly as your office copier, ADC's new Series 4000 Floppie Coppier™ automatically initializes and copies thousands of duplicate diskettes per hour—and doubles your throughput for double-sided diskettes!

Unlike other blackbox-type duplicators, Series 4000 gives you total single-master control of up to 16 slave stations—each simultaneously working on an entirely different diskette size and format. Since inventing the original Floppie Coppier, ADC's developed over 390 different formats—and dozens of different protection schemes to prevent pirates from copying your Floppie Coppier "coppies."

ADC's own industry-standard-setting Robotic Disk Handler is built into each Series 4000 slave unit, automatically loading and unloading up to 100 diskettes with patented gentle fingers that eliminate the disk destruction of other systems. Floppie Coppier assures you of perfect "coppies" every time with true CRC control of both ID and data fields, instead of the indiscriminate duplication favored by some of our copy-cat imitators.

Compare and you'll come back to the original—especially now that the new Floppie Coppier is even further ahead with simultaneous double-sided duplication—another ADC first!

APPLIED DATA COMMUNICATIONS

(714) 731-6000

First and still foremost in media duplication and test technology

BANK from page 47

tions, it estimated the Kodak unit would cost about $30,000 less and offer greater capacity. The Kodak units were plug-compatible with the bank's computer operation and transparent to the printer spooling system. In addition, both the Komstar hardware and software had established a solid reputation for trouble-free performance, Barrera said.

The bank now has nine Komstar units for production applications, generating two-thirds of the bank's total monthly output. In a normal month, each Komstar produces about 3.5 million pages of output, but at peak times the average can be as high as 4.2 million pages per unit.

"We use the COM equipment for all demand deposit account reports, branch-type output, bank card journals and statements and a number of other production reports," Barrera said. The customer statements mailed to account holders are about the only paper generated in this process.

The move to the on-line COM exceeded management's goals of increasing COM usage and reducing costs. "Staffing for wet COM required six operators on each shift — a minimum of 18 people. Today we have 12 operators, and we produce about 20% more data," Barrera said. He predicts further staff savings this year as the bank implements plans to relocate the duplicators to the printer pool floor and cross-train the COM staff with paper-output personnel.

In addition to reducing personnel and waste, "The compaction capability of the Komstar has enabled us to achieve a 26% savings in supplies," Barrera noted. "The laser technology allows us to average 210 frame/fiche vs. the 156 frame average of the CRT technology." Also, the operation now creates about 500,000 duplicate fiches each month, which compares to 800,000 a month in the past — a 37% reduction in duplicating costs.

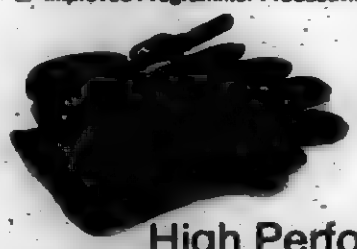
Four Kodak Photomatrix 8955 autoload duplicators are used to produce copies in San Francisco, and one Photomatrix and a Kodak Ektafiche Duplicator are utilized in Los Angeles.

HIGH PERFORMANCE HANDLING

File-AID Puts You in the Driver's Seat to Access Data without Programming.

File-AID gives you high performance handling benefits.

- ☐ Immediate Data Access Without Programming
- ☐ Improved Testing Effectiveness
- ☐ Lower Conversion Costs
- ☐ Better Use of VSAM
- ☐ Reduced Production Delays
- ☐ Increased Security
- ☐ Improved Programmer Productivity



File-AID the Key to High Performance.

File-AID speeds up the utility functions associated with record and file handling.

File-AID is a dependable and reliable tool. And it is supported by a crew of professionals at Compuware, a company with over 2,000 users worldwide.

File-AID is flexible and able to respond in all situations: test and production; regular and special functions.

File-AID is efficient. It combines many utilities into one inexpensive, easy-to-use productivity tool.

File-AID gives the professional greater control over his data environment.

File-AID can put you in the driver's seat fast. It is easy to use and requires virtually no training. The menus, panels, tutorials and control information make it a natural extension of your current environment.

File-AID/SPF

All Access Methods.

File-AID/SPF supports BROWSE, EDIT & UTILITY functions for all standard IBM access methods.

Record/Member Selection.

File-AID/SPF provides expanded IF, AND, and OR logic for record or member selection and processing.

Logical JCL Processing.

File-AID/SPF recognizes JCL as a special format and JCL is treated as logical statements.

Improved Edit.

File-AID/SPF provides a record editor for all access methods with no record or file length restrictions.

New SPF Utility Functions.

File-AID/SPF provides many new utility functions including:

- ☐ Load module CSECT and directory entry mapping
- ☐ Selective COPY functions for records/members.
- ☐ New full function VTOC utility.
- ☐ Full VSAM cluster, alternate index and path support (display, delete, etc.) without the IDCAMS utility.

Ease of Use.

File-AID/SPF requires no training.

File-AID/BATCH

All Access Methods.

File-AID supports all standard IBM OS or VS access methods and device types.

Multi-Function Utility.

File-AID/BATCH is a parameter-driven utility which combines the most often used file and record handling functions.

- ☐ Print, list or dump whole records or portions of records.
- ☐ Copy up to 99 datasets without control cards while mixing any file organization or record format.

File-AID is a comprehensive, easy-to-use data manipulation utility.

- ☐ Selective retrieval or sampling from any file based on record position, or data contents to the bit level.
- ☐ Altering data format or record structure.
- ☐ Access multiple datasets.
- ☐ Accumulate data in any format.

Additional Information.

File-AID/BATCH provides complete audit trail information as well as concise control card error messages.

Flexibility.

The flexibility of File-AID/BATCH is demonstrated by its ability to combine data from different sources or to copy data from or to unlike devices or access methods or record formats.

Test Drive File-AID with a FREE PRODUCT EVALUATION TIME TRIAL

Get behind the wheel. Try File-AID's High Performance Handling with your own drivers and crew. For your FREE 30-day evaluation call 800-521-8363 (in Michigan or Canada: 313-540-0400).

Dairy skims costs by giving managers micros

BARABOO, Wis. — The desire for greater cost efficiencies and improved patron service led a top dairy cooperative, located smack in the middle of the nation's dairyland, to buy microcomputers for its managers.

Wisconsin Dairies, a new member of the Fortune 500 with 1983 revenues of $445 million, chose Honeywell, Inc.'s Microsystem 6/10. The micros not only offer the cooperative's managers personal computing capabilities, but also function as end points in the cooperative's network.

Wisconsin Dairies, which consists of 11 manufacturing plants, handles about 2.5 billion lb of milk from four states every year. The plants have a total daily processing capacity of 7.8 million lb of milk, and the Richland Center, Wis., operation can produce 180,000 lb of cheese a day.

Because of the mammoth operation, plant managers last year became interested in using computer-based management tools. Before they received micros, the plants' data processing needs were served by terminals that were linked via communications lines to a Honeywell Level 6 minicomputer at the cooperative's Baraboo headquarters. The terminals could perform the data entry functions the plant required, but without decision support capabilities.

"Our plant managers were looking for a system that would help them generate information they could use on a day-to-day basis to manage their operations. In many cases, they couldn't afford to wait for reports from headquarters," said Susan Frish, Wisconsin Dairies' data processing manager.

A search by Frish and her staff for a microcomputer to replace the terminals ended with the Microsystem 6/10 with an Intel Corp. 8086 processor option.

"The 6/10 has the same operating system as the minicomputer we have at headquarters, so we knew we could communicate to a host easily. In addition, with compatibility we didn't have to fear upgrades," Frish said.

Initially, the new systems served as a data entry operation that is the basis of the dairy cooperative's complex patron payroll system. The plants receive milk from a network of milk haulers who make pickups at each of more than 5,000 patron farms served by the cooperative. Milk haulers keep track of pickups on tickets that record the date, patron number and weight of the milk.

When the haulers deliver the milk to the plants, the ticket data is entered into the microcomputers, and the systems check the haulers' figures for accuracy. The information then is transferred to the minicomputer in Baraboo, where it is used to help determine each patron's monthly or biweekly milk check and voucher.

Additionally, patron stores at each plant location dispense such supplies as butter and cheese as a service to cooperative members. The haulers deliver the items to the patrons upon request, filling out information on the delivery on supply tickets. The information also is entered in the microcomputers, following which it is electronically transferred to headquarters where it is factored into the payroll calculations.

Plans are under way to transfer part of the patron master file to each of the microcomputers at the plants so that plant management will have vital patron information at its fingertips in dealing with farmer inquiries.

Frish said the microcomputers also will be used for inventory control and product tracking to enable plant management to improve cost control measures.

Normally, you might not trust a product with a new name. But while all of our products have a new name, they also have a proven history of quality and reliability.

That's because Genicom was formerly the Data Communication Products Department of General Electric. Now an independently owned company, Genicom will continue the same product line we established with GE...only the name has changed.

Our Genicom 3000 family, for instance, still offers the same performance features already preferred by users and the design flexibility so important to OEM's, distributors, retailers and dealers. Speeds from 40 to 400 cps. Single or dual mode printing. Type quality from EDP to NLQ. Multi-color printing. Graphics. Selectable type fonts, American craftsmanship and more.

Of course, we'll also offer Genicom 2000 teleprinters and the soon to be introduced 4000 shuttle matrix printers. You'll find we have the same complete product line that we had with GE. We have the same corps of experienced employees, the same facilities, and the same nationwide service network.

But above all, we have a new commitment to excellence. Which means, while we continue to serve existing customers with established products like our 3000 family, we plan to introduce more products to meet growing needs.

At Genicom, we've changed our name and we're planning to change the future with more innovations, and more of the quality you've come to expect from us under any name.

Genicom Corporation, One General Electric Drive, Dept. M321, Waynesboro, VA 22980. In Virginia, call 1-703-949-1170.

Micro applications top newest book trends

By J. Daniel Couger
Special to CW

Noteworthy among the more than 300 computer books published in 1983 is the improvement in books on system design and advanced programming. However, the 17th edition of the *Annual Bibliography of Computer-Oriented Books*, released this month by the University of Colorado, lists only 265 of those books. Omitted from the bibliography are 52 "inadequate" books published on micro and personal computing; included in the bibliography are 34 very good books on that subject.

Another area of continued improvement, for the second year in a row, is the category of management of data processing. Inmon's book *Management Control of Data Processing* is an example. Ten new books were added to that section.

Programmer Productivity (Arthur) and *Software Testing Techniques* (Beizer) are examples of the high-quality books that are published in the advanced programming category.

Brachett's *Developing Data Structured Information Systems* and Brill's *Building Controls Into Structured Systems* are examples of the improved books in the system design category.

All introductory books published prior to 1980 were deleted from the bibliography. Despite the deletions, the bibliography still contains more than 1,200 books from 173 publishers. The bibliography separates the books into 86 categories and catalogs them according to type (reference, textbook, handbook) and style of presentation (programmed instruction, case study or narrative).

Over half of the new personal computer books were related specifically to the IBM Personal Computer. An example of the excellent new books of this type is Pollack's *Programming the IBM PC in UCSD Pascal*.

In the general microcomputer category, McGlynn's *Simplified Guide to Small Computers in Business* maintained this author's reputation for excellence.

The newest trend in applications-oriented books is not surprising — it is the large number devoted to micro-based applications. Nor is it surprising that the electronic spreadsheet books dominate. Nine of the applications books are devoted to that subject.

Representative of the good books in other application areas is *Forecasting on Your Microcomputer* by Nickell. The nonmicro area was enhanced by books like Bodnar's *Accounting Information Systems* and Jarrett's *Computer Graphics and Reporting Financial Data*.

Because of space limitations, the only application books included in the bibliography concern business uses of the computer. Nevertheless, there are 27 new books in that category.

As would be expected, the office automation category continued to evidence rapid growth. The three Peter McWilliams books are a refreshing addition to that category.

Another quality addition is Forbe's *Word Processing Procedures for Today's Office*.

Ninety-six books are listed in the advanced programming category, including 12 new books. In addition, another 54 books are provided in the categories on operating systems, maintenance programming, microprogramming and structured programming. *The Structured Alternative* (Cassel) illustrates the solid additions to the latter category.

Introductory books on languages continue to proliferate. Books on Basic predominate (51), but Pascal is closing in (37). With six books, Forth now justifies a section of its own.

New language books include *Smalltalk-80* (Goldberg and Robson) and *Icon Programming Language* by Griswold and Griswold. Because of space limitations, most books on DP management published before 1980 were deleted. Despite these deletions, the category on management of data processing contains 65 titles. Valuable additions *The Politics of Projects* (Block) and *Measurement and Tuning of Computer Systems* (Ferrari).

> *The newest trend in applications-oriented books is not surprising — it is the large number devoted to micro-based applications. Nor is it surprising that electronic spreadsheet books dominate.*

The management category is subdivided as follows: computer performance, project management, personnel performance, system security and general management.

In addition to the aforementioned books, the new James Martin book, *Managing the Data Base Environment*, and the Atre book, *DBMS for the Eighties*, strengthen the system design category. The data base section now contains 63 entries; the data communications section contains 34 entries.

One of the better entries to the latter communications category is *Tutorials in Modern Communications* by Lawrence.

Other useful additions to the system design category are *Computer Systems Requirements* (Thurber and Patton) and *The Architecture of Wideotex Systems* (Gecsei).

In the decision support systems/MIS area, *MIS Design Variables and Decision Making* (Jenkins) is the premier addition. That section now contains 35 titles.

The history/future section of the bibliography has 12 additions since 1980. Of the newest, *The Naked Computer* (Rochester and Grantz) is the most interesting, while *The Fifth Generation* (Feigenbaum and McCorduck) is the most informative.

The artificial intelligence section now contains 17 titles, and the robotics section contains seven titles.

A robust section is graphics, with 12 new books. The "oldest" book was published in 1979. The new books in the graphics section range in sophistication from *PC Graphics* (Conklin) to *Formal Specification of Interactive Graphics Programming Language* (Hallgren).

The lack of new books in several important areas may be indicative of the lack of progress of computing in those areas.

The section on computers and society had no 1983 additions. Nor did the sections on marketing and government applications.

One hopes that some creative work is nearing completion in these areas.

Copies of the bibliography are available for $4 from "Computing Newsletter," Box 7345, Colorado Springs, Colo. 80933. The cost is $6 if an invoice is required.

Couger is distinguished professor of computer and management sciences at the University of Colorado.

SEs DEMANDING PERFECTION!

We want you.

We want to hire systems engineers. Ones who demand perfection at every turn. At Storage Technology, we like perfection. We strive for it. We demand it. That's one way we've grown to be a leader in data storage systems and technology. Demands, however, are a two-way street. Here are some things you can demand from us. And, how we'll respond.

Demand creativity.

The kind of creativity that makes your job worthwhile. The kind that puts your mind to work. We think all systems engineers should be creative. And imaginative when solving problems or enhancing systems. We accept creativity as an everyday part of your job.

Demand freedom.

Freedom to be a self starter. To be responsible. The freedom that lets you call your accounts "yours." Storage Technology will give you all the freedom you can handle.

Demand trust.

Trust in your knowledge and experience, your decisions, your dedication. We take great pride in trusting our systems engineers. That's because the difference between a good operating system and a great operating system can be a simple matter of trust. And we like great operating systems.

Demand participation.

Participation in major marketing decisions, customer account decisions and decisions about where the data processing industry should head next. Our systems engineers continually help us make these kinds of decisions. They're involved. Why? Because we need their experience.

Demand listening.

The kind of listening that takes your ideas, suggestions and problems seriously. We're perfect listeners. We'll listen to anything you have to say about our business. We're also good at applying what we've heard.

At Storage Technology, reaching for perfection is reflected in everything we do. We are a Fortune 500 company. The world's leading independent supplier of high performance data storage systems and technology. Storage Technology provides exceptional benefits packages which include health, dental and life insurance, stock purchase, profit sharing and more.

We currently have openings for systems engineers demanding perfection in the following cities:

BOSTON, CHICAGO, CLEVELAND, DETROIT, INDIANAPOLIS, LOS ANGELES, MILWAUKEE, MOUNTAINSIDE, and NEW YORK.

To demand more information about these or future openings send your resume to Fred Moore, MD 3K, Storage Technology Corporation, 2270 South 88th Street, Louisville, Colorado 80028.

Storage Technology is an Equal Opportunity Employer.

System measures field of vision

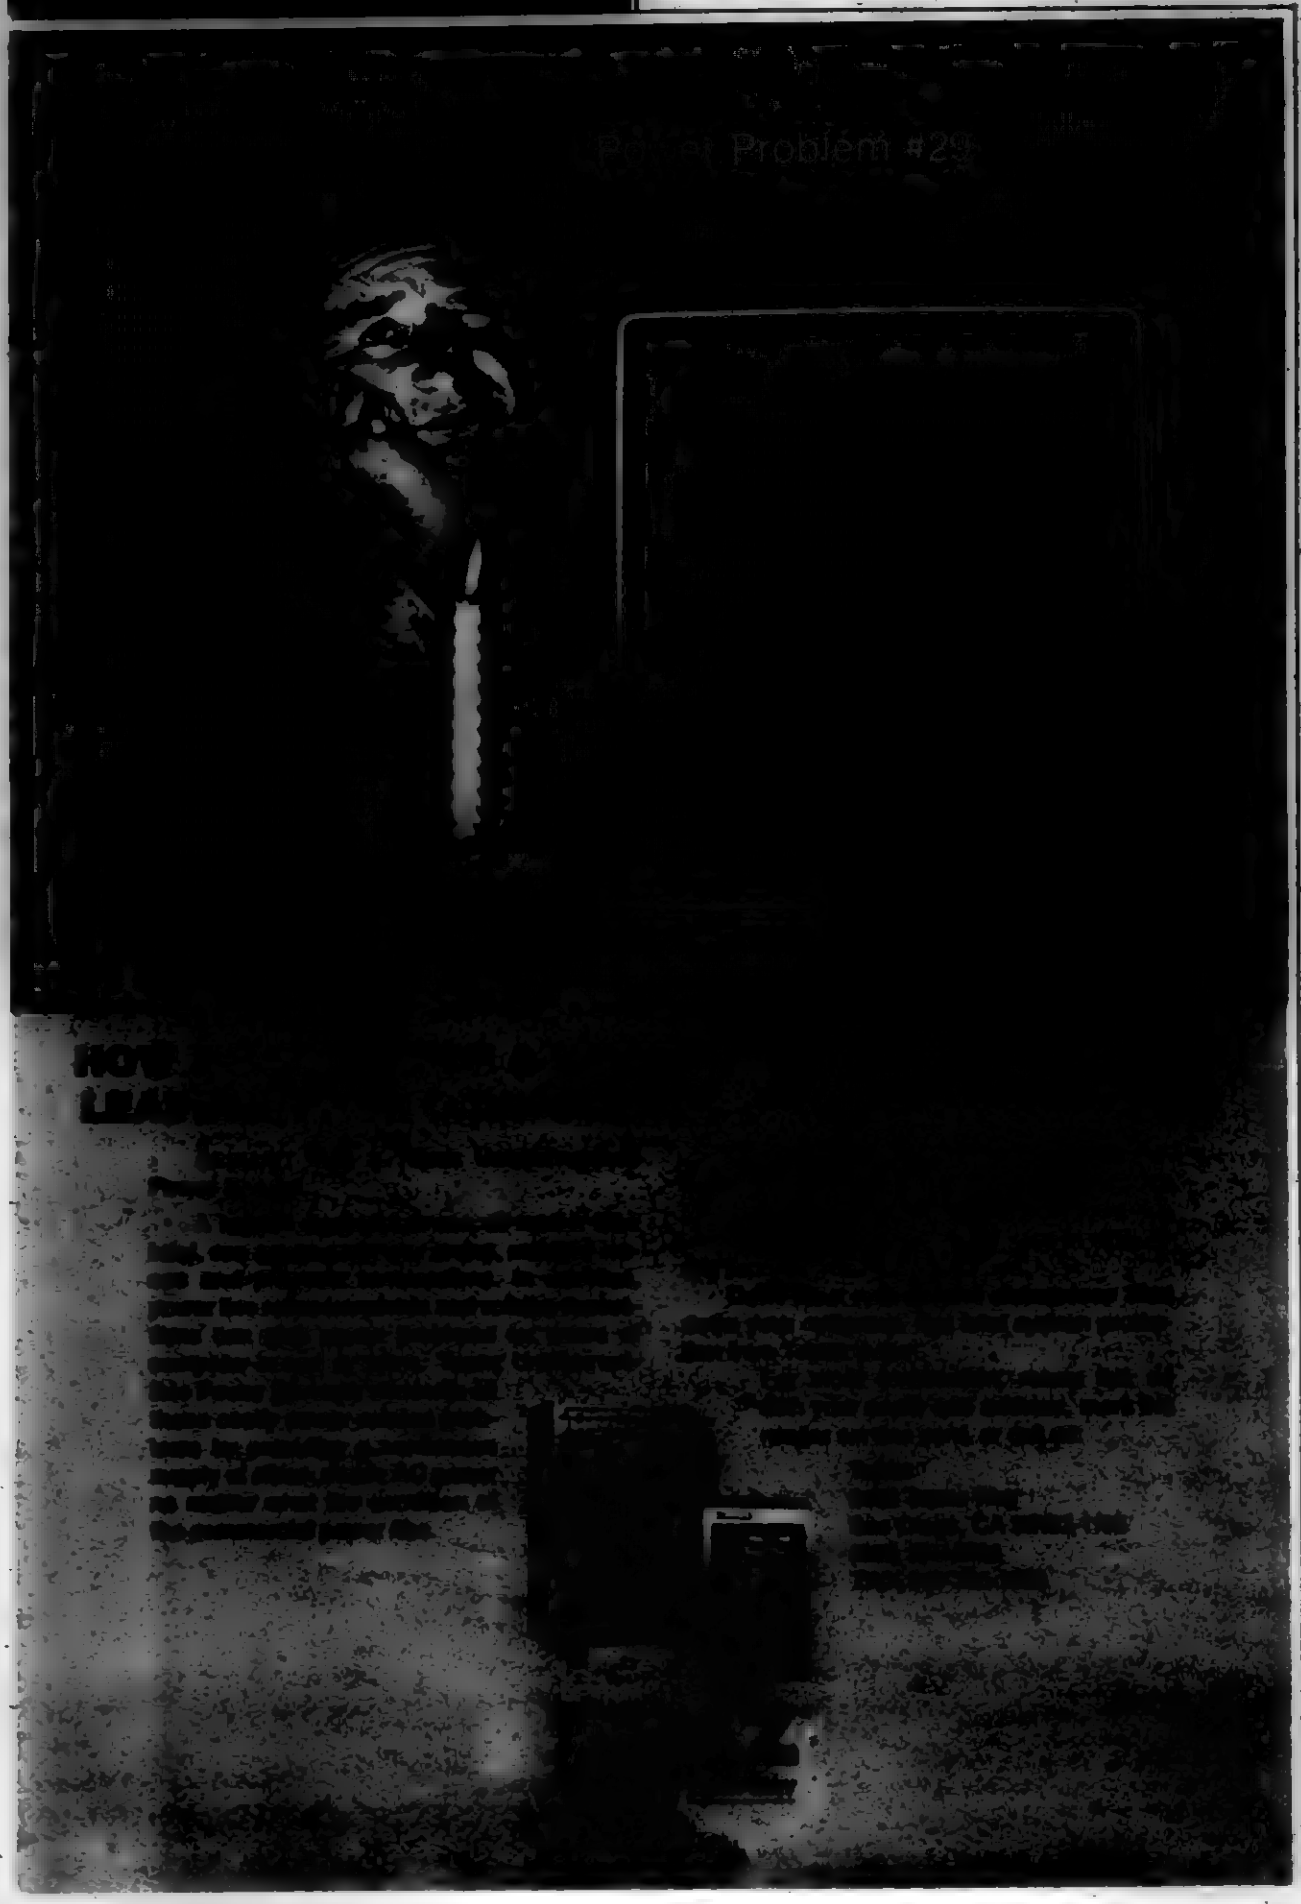
DURHAM, N.C. — Ophthalmologists at Duke University Medical Center here have begun using a computer to measure the field of vision in patients with glaucoma. Installed last summer, the computer is used on approximately 30 patients weekly.

According to a spokesman, the computer system is a vast improvement over previously used methods of measuring peripheral vision, the loss of which is one of the earliest signs of glaucoma. The computerized instrument still requires the response of the patient, but the examiner is partially replaced by the computer.

The Octopus 2000R computer, made by Cilco Corp. of Huntington, W. Va., utilizes Zilog, Inc.'s Z80A microprocessor with 64K bytes of memory and operates on Digital Research, Inc.'s CP/M operating system. The software was developed at the University of Bern, Switzerland.

The patient looks into a bowl while the computer automatically presents tiny spots of light in different parts of the bowl, and the patient is asked to indicate when test spots are seen. The computer can tell whether the patient is staring ahead, and it will double or triple check spots that the patient indicates he cannot see.

At the end of the test, the computer charts the patient's responses, giving the ophthalmologist a precise picture of the patient's range of vision.



Crwth offers training curriculum

SANTA MONICA, Calif. — Crwth Computer Coursewares has introduced a curriculum of interactive, computer-based training for users of Scholar/Teach 3, a computer-based training development and presentation system.

The system runs on IBM and IBM-compatible medium- and large-scale mainframes.

Courses now available are "Introduction to Data Processing," "Introduction to the Information Center," "Introduction to Data Communications," "Developing DP Skills for End Users," "SPF for End Users," "Using Focus" and "Using SAS."

"Using ADRSII" and "Using Answer/DB" will be released soon, the vendor said.

The courses are available for a 30-day free trial and can be leased with a yearly license ranging in cost from $1,200 to $3,700 or purchased with a yearly license ranging from $3,000 to $8,400.

More information is available from Crwth at Suite 200, 613 Wilshire Blvd., Santa Monica, Calif. 90401.

'It's overbearing.'

"The computer is down."

Every day another business goes "on line." Every day the world becomes more dependent on computers. And every day it becomes more important for the world to have a computer that won't go down, or even skip a heartbeat.

Over the past decade there have been computers designed to withstand hardware failures and eliminate downtime. However, all previous approaches depend heavily on software techniques to provide fault tolerance. A comparison of these old systems with the new Stratus/32 Continuous Processing™ System will illustrate how far we have come in one leap, by using advanced hardware technology instead of complex software.

How the Stratus Hardware Solution Supersedes the Software Solutions.

Stratus's hardware design means that fault tolerance is invisible to your application programs and users. You can even move previously developed applications to Stratus with NO CHANGES and NO PERFORMANCE LOSS for fault tolerance. In contrast, the software-based systems require complex, performance-stealing software in order to implement fault tolerance. This means that new programs are more difficult to develop, they run slower, and existing programs can't be run without major changes.

An added benefit of the Stratus fault tolerant design is that you can expand your system with additional processors as your computing needs grow. In fact, you can have up to 32 fault tolerant processors, 2000 communication lines, and 100 billion bytes of storage in a single Stratus system.

Hardware Self-checking Causes a Breakthrough in Service.

Each Stratus/32 tests itself EIGHT MILLION TIMES A SECOND while it executes your programs, so faults are detected BEFORE they corrupt your data. And when there is a failure, there's no need to rush to call your Stratus service technician. For one thing, the failed component, be it a CPU, controller, disk, or power supply, has a partner that continues operations as usual (without slowing down the system), so there's NO DOWNTIME. In addition, repairs can be made WITHOUT STOPPING THE SYSTEM. It is so easy to repair a Stratus/32 that our service is provided at about one-half the average price charged by other computer manufacturers.

$140,000, Software Included.

Our prices are competitive with "normal" systems (i.e. ones that do not provide fault tolerance), and substantially lower than the software-based fault tolerant systems. $140,000 buys you a complete four megabyte 32-bit system with 60 megabytes of disk storage, magnetic tape drive, and system SOFTWARE. If you like our hardware, you will be even more impressed with our software. (A common reaction among our users.) Briefly, our software offering includes VOS (a virtual operating system), transaction processing, networking, IBM communications, data management system, interactive forms builder, symbolic debugger, COBOL, Basic, PL/I, Fortran, Pascal, word processing. . .

To get more information call us at 617-653-1466.

The computer you can count on has arrived.

Stratus

CONTINUOUS PROCESSING™

Now that the world relies on computers it needs a computer it can rely on.

CALENDAR

WEEK OF MARCH 4

MARCH 5-9, NEW YORK — **Structured Design and Programming Workshop.** Contact: J. Baldwin, Yourdon, Inc., 1133 Ave. of the Americas, New York, N.Y. 10036.

MARCH 5-16, PARSIPPANY, N.J. — **ANS Cobol.** Contact: Chubb Institute, 8 Sylvan Way, Parsippany, N.J. 07054.

MARCH 6, BOSTON — **Computerized Personnel/Payroll Seminar.** Contact: Carol A. Koschak, Insci, 95 Chestnut Ridge Road, Montvale, N.J. 07645. Also being held March 6 in Huntsville, Ala., March 7 in Omaha, March 8 in San Jose, Calif., West Orange, N.J., and Greensboro, N.C., and March 13 in Anaheim, Calif.

MARCH 6-7, PITTSBURGH — **The 1984 Tri-State Telecommunications Exhibition.** Contact: W.C. Hunkele, Telecommunications Management Association, P.O. Box 8839, Pittsburgh, Pa. 15221.

MARCH 6-8, CARY, N.C. — **SAS Exploratory Multivariate Data Analysis Course.** Contact: SAS Institute, Inc., P.O. Box 8000, Cary, N.C. 27511.

MARCH 6-8, WASHINGTON, D.C. — **Getting Ahead With Micros.** Contact: The U.S. Professional Development Institute, Microcomputers in Government, Department AB, 1620 Elton Road, Silver Spring, Md. 20903. Also being held March 13-15 in Denver, March 20-22 in New York and March 27-29 in Seattle.

MARCH 6-9, LOS ANGELES — **The National Data Base and Fourth-Generation Language Symposium.** Contact: Digital Consulting Associates, Inc., 339 Salem St., Wakefield, Mass. 01880.

MARCH 6-9, PALO ALTO, CALIF. — **Data Communications.** Contact: Ruth Dordick, Integrated Computer Systems, 6305 Arizona Place, Los Angeles, Calif. 90045.

MARCH 6-9, LOS ANGELES — **Programming in C: A Hands-On Workshop.** Contact: Ruth Dordick, Integrated Computer Systems, 6305 Arizona Place, Los Angeles, Calif. 90045.

MARCH 6-9, WASHINGTON, D.C. — **Structured Design and Programming.** Contact: Ruth Dordick, Integrated Computer Systems, 6305 Arizona Place, Los Angeles, Calif. 90045. Also being held March 27-30 in San Diego.

MARCH 6-9, BOSTON — **How to Manage Software Projects.** Contact: Ruth Dordick, Integrated Computer Systems, 6305 Arizona Place, Los Angeles, Calif. 90045. Also being held March 20-23 in Palo Alto, Calif.

MARCH 6-9, PALO ALTO — **Defining Software Requirements, Specifications and Tests.** Contact: Ruth Dordick, Integrated Computer Systems, 6305 Arizona Place, Los Angeles, Calif. 90045. Also being held March 27-30 in Boston.

MARCH 7, CHARLOTTE, N.C. — **Planning a Manufacturing Information System.** Contact: Society of Manufacturing Engineers, One SME Drive, P.O. Box 930, Dearborn, Mich. 48121.

MARCH 7-8, CARY, N.C. — **SAS Color Graphics Course.** Contact: SAS Institute, Inc., P.O. Box 8000, Cary, N.C. 27511.

MARCH 7-9, SAN FRANCISCO — **Local-Area Networks.** Contact: The American Institute for Professional Education, Carnegie Building, 100 Kings Road, Madison, N.J. 07940. Also being held March 14-16 in Boston, March 21-23 in Philadelphia and March 28-30 in San Diego.

MARCH 7-9, WASHINGTON, D.C. — **Structured Analysis and Design.** Contact: McCabe and Associates, Inc., Suite 111, 5501 Twin Knolls Road, Twin Knolls Professional Park, Columbia, Md. 21045.

MARCH 7-9, STAMFORD, CONN. — **Layered Network Architecture and ISO Seven Layer Standards.** Contact: Data-Tech Institute, 386 Franklin Ave., P.O. Box 569, Nutley, N.J. 07110. Also being held March 14-16 in Detroit, March 21-23 in Boston and March 28-30 in Orlando, Fla.

MARCH 8-9, STAMFORD, CONN. — **Digital PABX: Architectures, Networks, Systems.** Contact: The American Institute for Professional Education, Carnegie Building, 100 Kings Road, Madison, N.J. 07940. Also being held March 22-23 in Washington, D.C.

MARCH 8-9, SAN DIEGO — **The Spring 1984 Conference for Computers in Construction.** Contact: CIP Information Services, Inc., 1105-F Spring St., Silver Spring, Md. 20910. Also being held March 22-23 in New York.

MARCH 8-9, PHOENIX — **Personal Computer Local Networks.** Contact: Architecture Technology Corp., P.O. Box 24344, Minneapolis, Minn. 55424. Also being held March 15-16 in Atlanta and March 29-30 in Washington, D.C.

MARCH 8-10, ACAPULCO, MEXICO — **The 1984 Computer Dealer and Lessor Association Spring Meeting.** Contact: Computer Dealers and Lessors Association, 1212 Potomac St. N.W., Washington, D.C. 20007.

WEEK OF MARCH 11

MARCH 12, STAMFORD, CONN. — **Planning for XA: An Unbiased Analysis.** Contact: Techtran, 72 Cummings Point Road, P.O. Box 10212, Stamford, Conn. 06904. Also

Gloucester, MA 01930

EVERY COMPUTER COMPANY TALKS SERVICE UP FRONT. BUT HOW MANY OF THEM CAN BACK IT UP?

These days, you've got to be real careful that the service a company promises you is more than just lip service.

Because if something goes wrong with your new equipment, and their service isn't right, you've just bought yourself a real headache.

At ITT Courier, we've been around long enough to know you can't sell customers short when it comes to service.

So we back up every ITT product with 150 service centers in North America alone.

We staff every one of those ITT Service Centers with field engineers who get their training at our state-of-the-art service school, not on your equipment.

And we give every ITT customer the security of a 24-hour service hotline, seven days a week.

Of course, no company can promise you a fail-safe product. But at ITT Courier, we're very proud of how quickly we can rise to the occasion should your system ever go down.

ITT Courier Service. It's one important reason we'll be around long after a lot of those other companies are long gone.

Contact your nearest ITT Courier Representative. Or call the ITT Courier Sales Support Department at 1-800-528-1400, toll-free.

ITT COURIER

YOU KNOW WE'LL BE AROUND.

"We're saving $50,000 a year by eliminating SYSOUT printouts and installing JCLWTR."

That's the word from one user of AID's new JCLWTR system.

Instead of printing every production SYSOUT listing, JCLWTR stores them on disk where they're instantly accessible through special SPF screens or hard copy printouts.

The savings in paper, printing, handling, and storage costs add up so quickly that even medium and small shops can recover the system's minimal cost in just months.

JCLWTR installs on medium and large IBM systems operating under MVS and supports on-line interfaces to COM.

Find out how much you can save with AID's JCLWTR system. Send in the coupon, or call Lew Kabza at 312/654-3030.

AID Applied Information Development, Inc.

Before you buy a printer look at the fine print.

There's a big difference in printers, and the proof is right before your eyes.

This is an actual printout from Digital's Letterprinter 100. As you can see, it's good enough to send out to customers.

But that's not all the Letterprinter 100 can do. Suppose, for instance, you're in a hurry.

JUST PUSH A BUTTON AND YOU CAN PRINT OUT A WHOLE PAGE OF DRAFT COPY IN LESS THAN TEN SECONDS.

There are other fine points. You can see how the Letterprinter 100 can print multiple typefaces. It can also print in **BOLD**, d o u b l e - w i d t h and subscript. And do all these styles automatically, without stopping. And with its wide range of graphics capabilities, you can even draw your own conclusions.

EDITORIAL

Vendor schemes that backfire

Storage Technology Corp.'s recent decision to abandon development of an IBM-compatible mainframe should be studied as a warning of the pitfalls that await vendor and user alike as technology advances evermore rapidly.

Until very recently, STC had boasted, and evidently believed, it could broaden its stake in an increasingly cutthroat business by developing yet another high-performance, IBM-compatible processor. The machine had a planned shipment date of late 1984, which was just recently pushed back from early 1984. Although the company cited technological problems [CW, Feb. 6], it apparently felt that even with just a short delay, the product would no longer be competitive.

The cancellation of the STC project was, unfortunately, not a unique incident for users who make current purchase decisions with one eye focused on forthcoming products. For example, Trilogy Ltd. announced long ago it would ship an IBM-compatible mainframe with new technology in 1985; just last month it announced a brief delay in completing the prototype wafer-scale semiconductor that will be crucial to the new machine.

In this case, vendors are also experiencing what it's like to be on the receiving end. Both Digital Equipment Corp. and Sperry Corp. made substantial investments for rights to Trilogy's still unproven technology that may or may not bring processing to a new plateau.

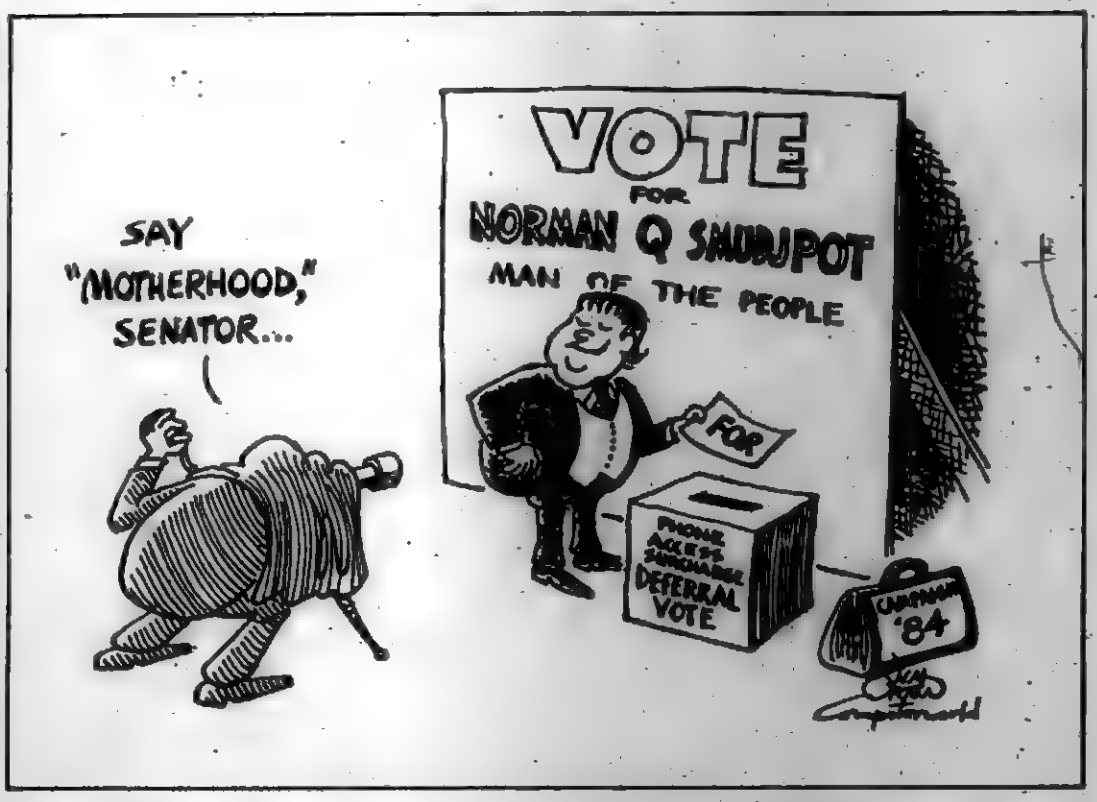
Given the increasingly breathtaking pace of new developments in processing power and applications, it is not surprising that vendors feel compelled to "overpromise" products. The juices of competition are leading to greater dependence on the marketing tactics of Madison Avenue rather than that good old American tradition of proving oneself with actual performance in the marketplace.

You may call it "selective leaking" or you may call it "intrepid reporting," but the fact is that products are being heralded even before a prototype has a chance to power up.

The microcomputer market recently demonstrated dynamics that inevitably will be felt throughout the processing hierarchy. Months of speculation about IBM's PCjr wreaked havoc upon the micro marketplace, then Apple Computer, Inc.'s masterful manipulation of both the trade and the general press served to detract attention from developments by other vendors that might have just as much significance if only given a chance.

When it comes to software, vendor claims seem to be going beyond mere boasting to a possible disregard for ethics. Mainframe-micro linkages are announced weekly, but how many management information systems directors will tell the corporation president he can start manipulating mainframe data from his desktop? Packages that merely contain a new wrinkle to existing technology are heralded as stunning breakthroughs, yet a systems planner for a major corporation told a conference recently that his major gripes are "me-too" packages and "unfinished products" that don't perform as promised.

Users have been indoctrinated to expect breakthroughs, and they certainly must consider what may be coming down the pike when they are planning long-term strategies for their DP shops. But while vendors certainly have every right to scratch to stay in business, they run the risk of disillusioning users to the point that they dare not make a decision revolving around a "forthcoming" product for fear that, at best, it will not work as promised or, at worst, that it will never appear at all.



LETTERS TO THE EDITOR

Your Social Security number: the downfall of individual privacy?

Computerworld's year-end issue included the article "Privacy issues in 1984" [CW, Dec. 26/Jan. 2]. Last fall, *Computerworld* featured the editorial "Silent watchers" [CW, Sept. 12]. And in earlier issues, there were numerous articles included in *Computerworld* that focused on the issue of hacking.

In all the articles written on computer abuse relative to individual privacy, one consideration has been overlooked, that is, that we have given the abuser one very important tool that should be taken away; we have given the abuser a unique identifier.

Today, your social security number is used as an identifier for just about everything.

Your social security number is used for credit applications, medical services, group insurance, a driver's license, nonincome-related employment personnel records, to be a "block home" — the list goes on.

Furthermore, there are no restrictions placed on the use of the social security number by private industry or state government.

What is needed is a law that restricts the use of the social security number to reporting income to a taxing authority or to give a social security benefit.

Michael Stasik
Beaverton, Ore.

VIEWPOINT

The phenomenon of MIS 'plateauing'

THE DATA CENTER

JOHN P. MURRAY

Having observed the pattern of development and change within a number of management information systems (MIS) installations over many years, I have come to the conclusion that many, I suspect most, MIS installations operate in concert with a cyclical rhythm. While the tempo is different from organization to organization, it does indeed appear that certain circumstances create an ebb and flow within the typical MIS department.

As an example, the MIS department reaches a given level of performance that is, for whatever reason, viewed as acceptable. There then begins a slow, at first imperceptible, decline in the overall quality of the MIS service to the organization. Once begun, the decline continues, usually at a slow but steady pace. This continues until a certain stage is reached, often caused by some rather dramatic event, a disaster of some magnitude that finds its way to the senior management level. This is the low point in the cycle.

When it becomes apparent that MIS is indeed in trouble, the effort will begin to do whatever is necessary (an often draconian effort) to bring the situation to an improved state. This is usually an expensive, time-consuming and often frustrating experience for all concerned. The outcome here is movement to the high level of the cycle where, usually, the process begins again.

Is this proposition about the phenomenon of MIS plateaus only some imaginary concept? I submit it is not imaginary, but a fact. Think first of the MIS installations with which you are familiar, then consider the amount of management turnover in those installations and, I believe, you have witnessed the effect of the MIS "plateauing" phenomenon.

Cause of MIS plateauing

What is the cause of this rather universal condition of MIS plateauing? There are a number of causes, but I think a primary cause is that of complacency. This complacency can be found in the client areas, in MIS and in the organization's senior management. Often it is a result of, or perhaps a reaction to, the attainment of a certain plateau. Usually, a great deal of money (or what may appear to senior management to be a great deal of money) will have been spent to bring MIS out of the low trough of the cycle; the MIS environment will be viewed as much improved; and senior management support and, perhaps more importantly, attention will be less forthcoming.

In time, MIS management will either simply stop attempting to alert senior management to the requirement to continue to advance with the technology (that is, keep moving to higher plateaus) and become complacent or move on to organizations that recognize they are in the low cycle and that need help. In either event, the down cycle for this MIS function has begun. It may take a long time; I am aware of two organizations in which it took eight and 10 years, respectively, to recognize the low level plateau that had been reached before appropriate action was taken. I suspect there are organizations with longer cycles, but sooner or later, most down cycles do bottom out.

This bottoming out may not be accompanied by the removal of the MIS manager. Senior management may accept the fact that it must share some of the culpability for reaching this low level and may, provided the current MIS management is competent, supply the support required to begin the climb to higher levels. In any event, sooner or later an effort to move ahead will begin and money will be available to get the job done.

Consider facts

Whether you buy this argument or not, it might not hurt to consider the facts in your own organization. Is progress in terms of the technology, in terms of MIS client understanding of MIS and the potential use of information processing being made? Or are there subtle indications that the MIS environment and its perception outside the MIS department is not as good as it was last year? Is your organization attempting at least to examine the potential of new technology and to attempt to use that technology that shows promise for the organization, or is the climate one of "What we have now is good enough"?

This plateauing phenomenon will become more apparent and the cycles less lengthy as the effective uses of technology expand and as the results of the use of that technology become more apparent. Those organizations that become aware of the cycling phenomenon and that take action to keep the organization heading to increasingly higher plateaus will be the future winners.

MIS functions do not stand still; if they are not moving ahead, not growing and evolving with the expanding technology, they are falling behind. Maintaining the status quo is simply hastening the eventual decline of the MIS function.

While we in MIS management may find the effort onerous, and while at times we all feel that indeed "the game is not worth the candle," we do have a responsibility to continue to push for the growth and development of the MIS function, to maintain the struggle to reach the next higher plateau. We have, I suppose, to accept the reality that our management does not want to address this issue, particularly if things are going reasonably well.

The movement to increasingly higher MIS plateaus can be expensive, both to attain and to continue. However, the investment in the continuous recycling of the MIS department is not only expensive, but it also has a deleterious effect on morale throughout the organization.

More time and attention need to be focused on the MIS plateauing phenomenon and to take steps to continue to move organizations ahead through the effective use of the technology, rather than to become caught up in the recycling syndrome. Time, effort and, perhaps most important, money should be invested in the achievement of ever higher MIS plateaus, not in being forced to start the climb over and over again. And this must be a concerted effort of MIS, clients and senior management. MIS cannot do it alone. ‡

Murray is director of management information services for Rayovac Corp., Madison, Wis., and author of Management Information Systems as a Corporate Resource, *published by Dow Jones-Irwin.*

Will publishing technology enter office system arena?

HUMAN CONNECTION

JACK STONE

C'mon now, who cares if a word processing operator can control the type fonts displayed on the monitor? Granted it is a clever demonstration to see an operator strike a few keys and watch the text shift gears into italics, but my view is that such capabilities, along with all the other complex paraphernalia that goes along with automatic typesetting, has always been the proper province of the publishing industry and not the business office — or so I thought until I ran into John Deaner, who is one of the true pioneers of automation in the publishing industry. Deaner set me straight on the matter.

Deaner, president of the newly established Tele Disk Publishing Co. (a subsidiary of LRC, Annandale, Va.), feels that new technologies have radically cut the cost of computer-based processes to the point where conventional offices will soon be able to afford the equipment.

Here is a summary of what he had to say when I interviewed him:

How can the average office fund such expensive equipment?

Right now, those in small firms cannot. They provide a comprehensive range of facilities — editing, proofreading, graphics design, telecommunications, typesetting, printing and photocopying — but make the process easier and more cost-effective than ever before.

In fact, Tele Disk has been organized as a publishing service bureau to help government and commercial firms accelerate their use of automatic publishing processes in everyday work.

I thought the daisywheel technology and its ilk, working with a photocopier, met the printing and copy needs for the vast majority.

They have in the past and will be around for a long time in the future. But the good old daisywheel machinery just cannot handle the surging demand for graphics, and everybody knows the limitations of line printers for quality work.

Furthermore, phototypesetters are too clumsy in terms of all the chemicals and ancillary equipment that are required.

However, there are extra dimensions of printing quality and speed offered by the new equipment that may be more suitable for the larger organizations.

Take the office-size laser printers, for example. Machines of this type are on the market that are no bigger than a copier, yet provide laser-quality originals from instructions, graphics and text in the form of a simple stream provided by the operator.

Typical machines are capable of producing a high-quality typeset page in a matter of seconds. Believe it or not, text for a 600-page book can be created in a couple of hours, including figures, drawings, line art and charts.

Have these machines improved on the paper loading and transport problems of the conventional copiers?

One machine that is available provides cassette loads of plain paper so that the output looks more like printed pages, not photoduplicated printout.

More impressive than this is that substantial savings in paper costs are possible by using compressed text and, thereby, compacting it on the page — a technique long used in the publishing industry to cut paper costs.

And new justification techniques, coupled with textbook-quality type fonts, make the compacted formats very attractive and easier to read as well.

But can these machines be cost-justified for routine office correspondence?

Of course; it depends on the volume requirements of the organizations, but the opportunities for cost, quality and performance improvements are legion.

Imagine storing the company logo in random-access memory instead of hard-copy letterhead or using a microchip instead of a stockroom to produce standard forms.

I'm guessing that many installations may wind up being cost-justified on the basis of cost savings of paper storage alone. ‡

Letters to Stone should be addressed to him at P.O. Box 33699, Washington, D.C. 20033.

Hackers: Hired guns of the high-tech age?

READER'S PLATFORM

R. RAJAGOPAL

Lately, we have been hearing a lot about hackers, mostly high school and college students who get their thrills by hacking away at different computer passwords or identification codes until they gain access to a computer somewhere in the country. By further hacking, it is possible, though not likely, for them to gain access to the computer's files or data bases. What do the parents of these kids do when the telephone bills arrive?

I do not condone professional criminals who, by hacking or other means, attempt to gain access to privileged information; they ought to be put behind bars. Nor am I defending the illegal activities of high school and college hackers who gain entry into other computer systems by trial and error for the sheer fun of it. I am interested in rechanneling the energies of the hackers who are harmless pranksters. Many times I wish I had the services of a hacker to get access to information that is supposedly in the public domain, that has supposedly been created to assist a variety of users.

Not a week goes by without somebody asking me to give information about my family and me: our taxes; our eating, playing and sleeping habits; how we manage our money; where we shop; what we read; when, where and how we got married; where we went on our honeymoon; how we dress; and asking if we'd like a loan, like to win a sweepstakes and how about a free vacation?

These data seekers reach me by simulated long-distance telephone calls, by mail, by telegrams, on the street, at my doorstep and in my office. Some even try to bribe me to fill out their forms by enclosing a dime or, occasionally, a quarter, insisting that I have a cup of coffee at their expense while filling out the form. But I am often gullible and fill out the forms, hoping that one day I will be a surprise winner of a sweepstakes because of the information I provided.

What happens to the data?

What happens to all the data that is gathered by the various marketing research firms, governmental agencies, associations, political action committees and consumer organizations? In particular, have you ever tried to get information from them? Try it — you will come to admire the skills of our hacking teenagers.

Our government — local, state and federal — gathers all sorts of data on a regular basis. One massive federal effort is the census, which takes place every 10 years. In addition, we spend billions of dollars each year monitoring and measuring our air, water, natural resources, health; social and economic conditions and the productivity of everything and everybody who produces anything. I assume that this data gets stored away in thousands of filing cabinets and computer storage devices. Ours is a highly monitored society.

The problem is that most of this gathered data seems to disappear. Many times I've wished a hacker could come to my rescue when I've sought information. When you request information from an organization, be prepared to hear any of the following responses:

- We only gather and store data, and no money is budgeted for retrieving it.
- Our programmer quit, so why don't you call us back in a few months?
- We had a budget cut, and the system is not maintained anymore.
- We just moved to a new site and haven't unpacked yet.
- Why don't you contact our Washington office?
- You had better ask the boss — and by the way, he's on vacation until next month.
- We lost the data tape.
- The data base is too complicated, and the chances of misuse are quite high, so it's our policy not to release it to outsiders.
- Our people are too busy — we can't free up anybody to comply with your request.
- We haven't put it on the computer yet.
- We haven't decided on the release date yet.
- We are switching to a new system, so why don't you call back in a year?
- We are going to print the data base in the form of a book and make it available through National Technical Information Service. You can buy it from them.
- Contact our central depository.
- If you need it that badly, why didn't you collect the data yourself?
- Make your data request by filling out Forms 5271, 6482 and 7633 in triplicate. You can get these forms by writing to our headquarters' data center. Allow six to eight weeks before contacting us again. No telephone inquiries or in-person visits will be permitted. To avoid any fur-

That's Why We Fully Guarantee it!

Only One Human Resource Management System is good enough to be fully guaranteed. Genesys'. Our own people developed all of our software and systems. Our own people will also install our system, compiling and testing all our programs for you. Then our people will stand behind their work with a no-strings, money-back guarantee.

Genesys is simply unbeatable. Most Human Resource Systems contain the raw data you need for management reports, government compliance and to let you know "Is she promotable?". But you have to do a lot of work preparing data to get the information you want because they've added third party software.

Not so with Genesys. All our software is completely integrated and menu-driven. No matter what you need to know about Payroll, Personnel or Cafeteria Benefits, it's easy to get precisely the information in exactly the format you want. Just one keystroke gives you selective search, decision support, PC integration and color graphics. Real-time, from any office, anywhere in the country. With by far the tightest, most flexible security available.

We're so confident you'll be successful with Genesys we'll give an unconditional guarantee. How can you beat that? If you'd like more information on the Genesys HRMS or would like to attend an Executive Seminar near you, call Norman Bushee at (617) 685-5400.

We must protect the data others see as threat

READER'S PLATFORM

HARLAN W. CROUSE

Much has been written and spoken about 1984, and with that year now upon us, we can expect even more commentary and predictions. Most of the comments have dealt with George Orwell and his writings. Nearly everything thus far expressed about 1984 has been negative — Big Brother, lack of privacy, world tensions and the problems of technology running rampant.

People have always been suspicious, even afraid, of new ideas and inventions. It seems to be a human characteristic to fear the unknown or that which may change comfortable, accepted circumstances. The negative ideas and threatening scenarios expressed in association with 1984 accentuate the tendency to technology paranoia.

One expression of this fear that we may see is a strong, overt reaction by the ordinary individual to such threats, especially a reaction against what may be perceived as Big Brother and the technologies associated with totalitarian rule. In many minds, computers and data processing fit into this category.

By "ordinary individual" I mean the common man on the street — not hackers, not people with any special knowledge of data processing and not those looking to subvert an automated system for illicit gain. It may be difficult for some to imagine ordinary Americans "rising up" to do anything, but fear and anger can be great motivators.

Increasingly mistrustful

Americans in recent years have become increasingly mistrustful of the government and large corporations. Concern over privacy has never been more intense. Many people still fear that computers and the large amounts of information stored and processed by these machines are primary threats to privacy.

It is quite possible that the near future may bring a rash of attacks on automated information resources — data, hardware, software, storage media and facilities, in fact, anything and everything associated with data processing, not excluding personnel. These attacks could be perpetrated by disgruntled people: those with a reason, real or imagined, for striking back at the perceived invaders of individual privacy and freedom.

These people may attack directly or by proxy. Skilled or enraged persons may attack directly, even physically. Those less skilled or more circumspect may use others to perpetrate their attacks. It is conceivable that a new service industry may be born to procure, alter or destroy information concerning individuals contained in various computer files and data banks. With the dearth of effective computer crime legislation, such activities may not even be illegal.

These attacks may not stop with disaffected persons. Social critics could represent another threat to automated information resources. Incidents similar to the anti-war activities of the late 1960s and the early 1970s may arise as citizens fight a perceived Big Brother. With an ever-increasing amount of government information residing in computerized files, what is the likelihood of an electronic version of *The Pentagon Papers*?

Those of us involved in data processing security walk a fine line. As individuals, we are as much concerned about Big Brother, privacy invasion and the accuracy of information maintained about us as the next person. As professionals, it is

More people in your position choose ASK.

After all the sales hype, analyses and benchmarks, the choice of a manufacturing system often comes down to a gesture of faith.

Don't make it blindly.

First consider why ASK inspires the confidence of more MIS professionals. (And why customer referral has made us the biggest in our field.)

Then consider this. Our MANMAN® software integrates manufacturing and financial operations more completely. So you'll never find yourself at a staff meeting accounting for your lack of cost accounting. Or your choice of a system.

Then consider the best part. You can fully implement MANMAN on a VAX or HP 3000 in under a year. So the information burden shifts from your shoulders sooner. And smoother. Because with our comprehensive training and documentation, your users quickly learn to help themselves to all the information they need.

Find out firsthand why more people choose ASK. Contact Carol Singh at (415) 969-4442 or 730 Distel Drive, Los Altos, California 94022. Get a customer referral. Then call and ask someone in your position about MANMAN.

What you hear will answer your every prayer.

Are computer vendors getting a fair shake?

READER'S PLATFORM

JOSEPH P. ZAMMIT

It is fashionable these days to portray computer vendors as callous, overreaching and dishonest. To listen to the hyperbole, one would think that computer vendors are the modern equivalents of snake-oil salesmen: telling the most outrageous lies in order to steal a quick buck, then fleeing town just one step ahead of a crowd brandishing tar and feathers.

But does the image comport with reality? More importantly, does the image do an injustice to legitimate vendors when a judicial forum to resolve the claims asserted by dissatisfied customers is available?

No doubt the industry has seen its share of disreputable characters. And computer salesmen, like all salesmen, are not bashful about praising the qualities of their wares. Yet it strains credulity to believe that vendors are guilty of outright fraud and deceit on anything like the scale that is sometimes suggested. It is simply not in the interest of vendors repeatedly to disappoint false expectations that they themselves have created. Most vendors are in business for the long haul, and they can hardly expect to achieve long-term success if they establish a reputation for habitual lying.

Several reasons

Nevertheless, the image persists. Why? I believe there are several reasons. First, despite the increasing frequency with which they are used in everyday commercial life, computers still retain something of the aura of magical black boxes. This perception is often an intellectual cop-out. For one thing, purchasers often fail to define adequately their own needs — something that the vendor cannot do for them. Moreover, it is easier for a potential purchaser to pretend that "this is just too complicated for an ordinary person to understand" than to assume some responsibility for making a decision. If responsibility is abdicated to the "expert" vendor, it is easier to blame the vendor (who should know better) if anything goes wrong.

A second reason for the poor image of vendors is the nature of computers themselves, particularly software. Computer systems are highly complex, frequently sensitive and never completely debugged. Every sale represents, to some extent, an educated guess that the system will be capable of fulfilling the user's needs — particularly if the sale contemplates any custom programming. Purchasers, failing to appreciate this fact of life, are quick to believe that any failure to live up to expectations reflects misrepresentation on the part of the vendor.

Finally, it is in the interests of certain groups — notably, a growing number of plaintiffs' "computer lawyers" — to promote the rather sleazy image of vendors. Recognizing that contracts frequently limit the vendor's liability, these attorneys have sought theories around such contractual limitations.

"Fraud" is the most obvious route. Not only does a fraud claim offer the promise of circumventing restrictive contractual provisions, but it tantalizes with the hope of unlimited punitive damages. Such possibilities have a lot more "sex appeal" to potential clients than the restricted recoveries available under most contracts. A small number of highly publicized decisions has lent credence to the exhortations of plaintiffs' attorneys.

Air of unreality

There is virtually no lawsuit filed against a vendor today that does not include a claim for fraud. Yet the very frequency with which the claim is asserted suggests an air of unreality.

Can it actually be that every time a computer fails to perform in accordance with the user's expectations, it is because the vendor lied? Can it be that there is even a legitimate question of fact whether fraud was committed in all these cases? I think not.

Nevertheless, the very assertion of so many fraud claims works an unfair hardship on vendors, particularly smaller ones.

While courts will often grant vendors summary judgment on breach of contract claims because of clear contractual provisions, they are extremely reluctant to accord similar relief on fraud claims. That means the vendor must undergo the not unsubstantial expense of extensive discovery and a trial. That trial will usually be before a technologically ignorant jury that itself subscribes to the "snake-oil salesman" view of computer vendors — a view often reinforced by one-sided horror stories appearing in the popular press.

Moreover, the evidence of fraud is likely to consist solely of the purchaser testifying that "the salesman told me," to which the vendor can respond only by denying; the jury then is left to choose whom to believe. It frequently believes the purchaser, no

IS YOUR COMMUNICATIONS NETWORK BREAKING UP?

Don't miss
"MANAGING THE COMMUNICATIONS NETWORK."
Exclusively from
Computerworld Reports.

How many vendors, how many different technologies does it take to make your network work? How many end users, how many decision makers *can* it take before something—or someone—cracks up? And does the telephone company break-up mean telecommunications tie-ups?

These are some of the critical questions posed by host John Gantz in "Managing the Communications Network," third in a lively, provocative series presented on 30-minute videocassettes and produced by DELTAK and CW Communications.

This month, you'll get the views of an industry expert, an MIS director, and a leading communications consultant. And be sure to stay tuned, because next month's Report will address another vital concern: the AT&T divestiture and its impact on information management. Watch for future Reports on subjects such as application development centers, artificial intelligence, end user training, the maturing information center, and more.

To learn all the signs of network break-up before your organization cracks up, order Computerworld Reports: "Managing the Communications Network." Call DELTAK order entry at (312) 369-3000; (416) 678-9222 in Canada.

How to avoid the 'snake-oil' salesman image

matter how farfetched his story, precisely because it does not understand how farfetched the story is.

Argument is unconvincing

Some would argue that fraud claims are a necessary and inevitable response to the "unfair" and "one-sided" contracts proffered by vendors that are far more knowledgeable about their products than their customers. The argument, however, is unconvincing.

The law of contracts was developed to permit parties to agree in advance on the rules that would govern their relationship and to allocate between them the risks of that relationship.

Allowing fraud to be used casually by dissatisfied purchasers to avoid contractual provisions unfairly defeats the legitimate expectations of the vendor. Even if the contract is a "standard form," no one has compelled the purchaser to sign. Moreover, given the highly competitive nature of the computer industry, the bargaining power of purchasers is far greater than some would like to believe. There is always the possibility of going to another vendor or paying more for an enhanced warranty. The fact that a purchaser has failed to explore adequately his alternatives should not be charged against the vendor.

Limit application

All of this is not to suggest that genuine instances of fraud do not exist or that when they occur they should not be actionable. Rather, the point is that fraud should be carefully confined to those situations in which it was meant to apply: intentional misrepresentations of material facts reasonably relied upon by the purchaser to his detriment. Courts should not be loathe to dismiss cases in which it is readily apparent that those standards cannot be met or to impose sanctions upon parties and their attorneys who assert fraud claims without sufficient basis.

Unfortunately, given the moderate degree of success achieved to date by the plaintiffs' bar, the trend is likely to be toward ever-increasing computer fraud litigation. Is there anything a vendor can do to protect itself? The answer is yes, although self-help is not an adequate substitute for a change in public and judicial attitudes.

First, vendors can build a certain amount of protection even against fraud claims into their contracts. For example, there is authority supporting the proposition that very specific disclaimers contained in a written agreement will prevent a plaintiff from relying on supposed contrary oral statements.

A general disclaimer of implied warranties or a merger clause is not enough; the disclaimer must specifically negate the existence of the alleged misrepresentation.

Another possibility is to broaden provisions that reduce the normal statute of limitations to include fraud as well as contract claims. Vendors might also want to consider arbitration clauses as a way of avoiding jury trials and punitive damages.

Vendors can also do a better job of policing their literature and sensitizing their sales force. Ambiguous statements in brochures can be avoided. Salesmen can be trained in the art of writing letters and proposals in a fashion that avoids unnecessary embellishment and includes appropriate qualifications. Procedures can be implemented that document what has been stated or promised at meetings with customers.

Finally, vendors can take a tip from the opposition and start choosing counsel who are knowledgeable and experienced in the computer area. For some inexplicable reason, vendors frequently choose attorneys without focusing in at all on the skills necessary to draft procurement contracts properly and to handle complex computer litigation. Firms that are perfectly competent for general corporate work or other types of litigation are not necessarily the appropriate choices for such specialized tasks.

Ultimately, a vendor's best defense is in the quality of its product, the integrity of its personnel and the good faith with which it supports its customers. A little good public relations wouldn't hurt either. But until prevailing attitudes change, vendors will have to factor potential litigation costs into the price of their products. From that perspective, it is ultimately computer users who pay for the poor image of vendors. ‡

ther delay, provide all the data requested in these forms. Send your request with a cover letter on your company's stationery with an endorsement by your company's president. This is a recording.

Of course, not all data bases are inaccessible to the same degree. Some are created with users in mind, and there are conscientious people in every organization who will go to great lengths to help you get the information you need as quickly as possible.

We users are thankful for these few concerned individuals. Without them, I suspect hackers would be hired regularly. On the other hand, there are people in many organizations who understand that information is power. They will go out of their way to stifle and limit users' access to information.

I believe that data collection programs should be coupled with the objective of providing those who need to make decisions with information that is timely, relevant and useful. If information is withheld or unused for some reason, then we can make decisions only on the basis of experience or judgment.

Every manager who is being urged to invest large sums of money to gather data should not commit the error of relegating this decision completely to technical professionals. These professionals have many redeeming qualities, but providing data to users in an efficient way is not one of them. It is commonly but erroneously assumed that managers and policymakers should not meddle with the design, development and operation of data collection programs — that such details should be developed by the technical professionals.

But these assumptions have caused American organizations considerable losses in terms of unused information. Managers should find out how the information system is supposed to help users like themselves and then hire a hacker or two to make that information available.

Governor's advisory

A Midwestern governor's advisory commission recently stated that there is a great need today to improve the kinds of decisions, both public and private, being made about resources. The decision makers need to have more ready access to accurate data on water quality and quantity, natural resources, soil, land use and pertinent geological features.

The commission further noted that much of the information is already available in a variety of forms and places, but it is not accessible to the public and its decision makers in a usable way. Perhaps the commissioners should hire a hacker.

Systems that provide useful information do not just come into existence. They must be planned, designed, developed, evaluated and modified with the active participation of users at every stage. Otherwise, hackers will become the hired guns of the high-tech age. ‡

How to get your people on-line. On the double.

One-touch access

The new Scanset 415 HS™ is more than a quick way to get information. It's a quick way to plug computer-shy managers into your information system.

Because Scanset was designed for convenience. Users get single-button dial-up and log-on to your computerized system. You get the ability to program remote Scansets with phone numbers, function keys, even screen brightness and speaker volume. All from your mainframe, without overriding managers' protected entries.

Plus, you can hook Scanset up using normal phone lines.

1200 baud graphics

The Scanset 415 HS will paint an entire screen of line or bar charts almost as fast as you can say, "Personal Information Terminal." And the 300 or 1200 baud rate is selectable right from the keyboard.

Once your people start getting 1200 baud decision-support, you can say goodbye to complaints about slow transfer rates.

Simplicity itself

Scanset has a built-in 36-number autodialer. So instead of the 30 or so keystrokes it takes to reach your data base, users press one button. Scanset does the rest.

And once users are on-line, programmable function keys speed them directly through to frequently-used computer commands. No need to spend time typing—One function key replaces up to 36 keystrokes.

Same goes for international phone calls. Or domestic calls, including connections to lower-cost carriers like SPRINT® or MCI® Multi-number muddles turn into single-button savings.

Answers on tap

If you're planning an information system or looking for a better way to get managers into the system you already have, look into Scanset. The Personal Information Terminal brings a whole new dimension to information management in just under a square foot of space.

Need more information? It's as easy to get as making a phone call. Which gets even easier with the new Scanset 415 HS.

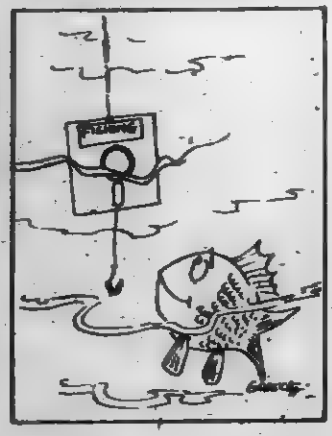
our job to protect those same resources that are seen by so many as a leading threat. To be effective, the security professional must recognize the adversities faced, advise employers and devise means of reducing vulnerabilities.

Let us all hope 1984 brings us neither Big Brother nor overreaction to a perception of such. However, data processing managers and security professionals must do more than hope; we must act, and we must act now. ‡

Croucher is systems security officer of automated DP at the Department of the Army, Fort Leavenworth, Kan.



IT is...

the leader in integrated decision support and data processing software.
Ten programs, each separately available, make the IT series the most comprehensive and flexible software system on the market for MS-DOS based personal computers.

Non-computer professionals will find IT easy to use. All programs are menu-driven and make extensive use of help screens. And for the DP professional, ITSoftware programs meet the kinds of operational data processing requirements that are now justified by the low cost of today's microcomputer hardware and software.

Whatever your requirements, you'll discover that ITSoftware meets more of your needs.

KeepIT™ keeps IT together.
At the heart of the ITSoftware series is KeepIT, a menu-driven, relational data base manager that acts as the core module through which all other software is integrated. Only a full data base management program like KeepIT can provide the flexibility of data entry, file transfer, records maintenance, report generation and file management capabilities needed to fully utilize the data calculation and presentation strengths of spreadsheet, graphics and word processing programs.

KeepIT's comprehensive design greatly extends the ability to transfer information from one program to another. Not just for a few numbers, but for entire data files. KeepIT also allows you to specify calculations on the data base and have the results transferred to a spreadsheet or graphics program.

Best of all, you don't have to replace your current software to take advantage of ITSoftware's advanced capabilities. Use them both. KeepIT also comes equipped with interfaces to most other popular micro-based software.

Other members of the ITSoftware series include:
CalcIT™: 3-D spreadsheet program.
LinkIT™: asynchronous communications package.
PassIT™: 3270 file transfer facility.
EditIT™: program editor with mouse management.
SortIT™: sort/merge utility.
StatIT™: MathStat™ program.
WritIT™: our release of MultiMate™ for word processing.
ShowIT™: graphics and drawing program.
SendIT™: for remote presentation of ShowIT slides.

SOFTWARE & SERVICES

Two DBMS types seen emerging

SOFTLINE

WILLIAM INMON

It seems that an evolution is occurring in data bases in the mid-1980s. In the large mainframe environment, the most complete embodiment of the original notion of data base was the "full-function" data base management system (DBMS). This is one that fulfilled the original goals of the data base while interfacing with or containing a teleprocessing monitor and interfacing with a standard operating system. It also handled a wide range of application functions and could handle both small and very large amounts of data. The standard for the full-function DBMS was IBM's IMS.

But there are signs that the DBMS is evolving from a full-function DBMS toward two types of DBMS — a high-performance DBMS and a decision support DBMS (Figure 1). The evolution is shaped by the realization that high-performance DBMS do not make a good foundation for MIS and that decision support systems do not make a good foundation for operational systems.

One trait of a high-performance DBMS is the very high arrival rate of on-line transactions that can be sustained. In a full-function DBMS, a sustained arrival rate of 20 transactions per second is very good. But in looking at future needs, it is not inconceivable to think in terms of 200 transactions per second.

Another trait of high-performance DBMS is the ability to manage very large amounts of data. The data bases kept by credit bureaus, insurance companies and government agencies fit into this category.

A third criterion for high-performance systems is on-line update data integrity. The on-line update of transactions must remain pure, that is, not interfered with by other on-line transactions acting on the same data at the same time. High-performance systems are optimized

See DBMS page 76

DBMS puts rail firm on track

Relieves MIS of application burden

CHICAGO — Besieged by requests for applications, the MIS department at Trailer Train, a major supplier of intermodal cars to the railroad industry, got back on track with fourth-generation information management technology.

Trailer Train has transferred much of the information processing function from MIS to end users. It has closed the loop with Focus, a nonprocedural data base management system and high-level language from Information Builders, Inc.

Trailer Train's information center has trained over 120 users within a year. Focus applications, accessing files ranging from 2,000 to 100,000 records, have been developed for an IBM MVS/TSO environment running on an IBM 3083 mainframe. "Wherever we can use Focus, we use it," Chuck Malone, manager of MIS, said. "It's much easier and a lot faster than writing a Cobol report program. If you've got to change your program, Focus makes it a lot easier to maintain."

Within the MIS department, Focus is used as part of a project management system tracking all information center requests, users and procedures for administrative reporting and resource management. The system is also used for outlining all productivity improvements developed within the company that replaced manual systems.

"It's easier for me to learn DP than it is for MIS to learn railroad distribution," Bob Caldwell, fleet distributor supervisor, said. "Besides, it might have taken months for the MIS department to develop my resource management program. With Focus, I developed a system that allocates 27,000-plus cars equally among the 10 major railroads by average car cost [and that also tracks] surplus and shortages in order to distribute cars where they are needed in the shortest amount of time. And I did it myself in two weeks."

In addition to leasing flatcars, gondolas and boxcars, Trailer Train spends about $100 million annually on shop maintenance for its cars and about $100 million more on repairs performed by railroads on Trailer Train cars while in service. Trailer Train runs three active maintenance facilities along with a regional distribution center for repair parts.

Pointing out that the maintenance expense is the single largest controllable expense Trailer Train has, Larry Greenfield, director of maintenance planning, estimat-

Denelcor unleashes HEP/UPX

AURORA, Colo. — Denelcor, Inc. has announced a Unix-based operating system called HEP/UPX for its HEP 1000 series of supercomputers.

According to a spokesman, HEP/UPX incorporates the file system from the University of California at Berkeley's Unix Release 4.2.

The file system is said to facilitate file transfers from most Unix-based workstations, minicomputers and superminicomputers. The vendor spokesman also said the operating system's performance in both time-sharing and real-time applications is significantly higher than Denelcor's HEP/OS operating system, which it replaces.

Denelcor also announced C and Fortran 77 language compilers for the HEP/UPX operating system. The compilers share a common code generator and an optional global optimizer for improved runtime performance, the spokesman said.

According to the vendor, extensions to both languages allow them to take advantage of the HEP 1000 architectural features of parallel execution and variable synchronization.

A source code license for HEP/UPX is priced at $15,000, which includes the C compiler.

The source code license for the Fortran 77 compiler is priced at $7,500, the vendor said.

Denelcor can be reached through P.O. Box 31500, Aurora, Colo. 80041.

Apollo recognizes the fact that there are two sides to every professional.

There's a part of a professional that involves their profession.

Then there's the part that goes to meetings, makes presentations, does budget, prepares documents.

According to recent reports, people who work with computers spend some 30% of their day working in their chosen profession. And 70% of their day just getting things done.

So we're announcing some ways for making better use of both sides of their day.

For starters, we've set some new standards in high performance workstations. By introducing a new set of Apollo computational nodes so fast you don't have to wait for them to figure out anything. Even when you're working on Solids Modeling, Image Analysis, Finite Element Analysis, and VLSI Design.

The power of a high-end 32-bit supermini at your desk for a fraction of the price.

The Apollo DN 660 and DN 460.

Inside you'll find up to 4 MB of main memory with full 32-bit architecture and an integrated hardware floating point unit. And enough power to handle up to 24 concurrent processes, each with up to 256 MB of virtual address space. Plus high resolution bit map graphics that among other things, can do area fills at up to 320 million bits per second.

In other words, they've got all the power of a high performance supermini like the VAX 11/780*. Except that they sit at a desk. And go for a fourth of the price.

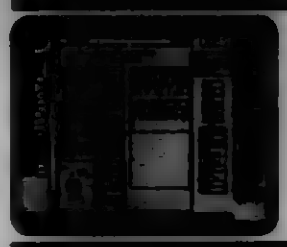
But even more important, each DN 660 and 460 workstation node you add to the Apollo DOMAIN network adds power instead of taking it away. Because each is a 32-bit workstation with network wide virtual memory that lets all Apollo nodes share data, software, programs, and peripherals transparently across the network.

But we've also introduced software that helps professionals work with the other side of their work: DOMAIN Professional Support Services. With Document, Mail, Calc, Calendar and File. All based on the more complex needs of the professional. And fully integrated with your application programs. So you can do all your work on the same system.

All of which should come as a very welcome development to every professional. Because we at Apollo are not simply making computers. We're making workstations that work for professionals.

For more information call or write Marketing Services Director, Dept. J1, Apollo Computer, 15 Elizabeth Drive, Chelmsford, Massachusetts 01824 (617) 256-6600, ext. 6608.

The DN 660 and DN 460 can do state-of-the-art Finite Element Analysis at state-of-the-art speed.



They work on documents the way professionals work.

They do Electronic Mail, Filing and Calendar Management.

FOCUS from page 69

ed his department saved $20 million with the help of Focus. "Focus has allowed us to compile 10 years' worth of data covering 100,000 cars, repairs and mileage records. We were able to identify high-cost cars and change our maintenance strategy," he said. "By zeroing in on critical areas, we perform maintenance more frequently, but do less extensive repairs."

Focus programs have been developed that break down by car type and mileage level in order to schedule preventative maintenance; track repetitive repairs to pinpoint which cars to bring in and when; identify which items to fix; and forecast component life. A maintenance plan has been developed that projects mileage 10 years into the future, forecasting the level of maintenance expected as well as the dollars that will be spent. A "most wanted list" has been developed that identifies Trailer Train cars experiencing repetitive repairs and pinpoints the reasons for the defects.

Greenfield pointed out that an ongoing cost of $10 million a year incurred by continually replacing wheels was brought under control by information made available from Focus programs isolating the nature and location of the problem. "Focus opened up a lot of possibilities that we just cringed at before because of the amount of data involved," he said.

"The people in my organization use Focus to extract reports that are not available in a purchasing and materials system in a traditional data base management system such as we have," said Peter Stoyanoff, director of material management. "Normally, it could take months for people to get a report. But now they can get a report the same day."

In the materials area, Focus is used to track the status of defective material returned to suppliers, track the availability of reconditioned material and track scrapped cars and repair histories. In addition, a network has been established between the three major maintenance facilities in California, South Carolina and Florida and corporate headquarters in Chicago for accessing centrally maintained material information. "Key information needed in the shops, such as parts forecasting schedules and inventory reports, is now printed and updated on remote terminals," Stoyanoff said. "It used to run in our corporate Chicago office and had to be mailed to the shops. Now the shops can get it overnight."

"Instead of users requesting numerous changes to the current reports they receive from MIS, they can easily create new reports in Focus with existing data and make ad hoc requests," said Mike Saeger, project leader of the information center. "With Focus you can define multipath structures, enabling the users to request reports in just about any format they want."

The Data Center is under your command.

But is it under your control?

Value Computing's systems management software automates the critical tasks of production forecasting and scheduling, capacity planning, and resource allocation and accounting, and brings those tasks under centralized control. Your control.

The effects on data center operations are immediate: a more stable production environment ... faster turnaround ... fewer manual procedures ... shorter night processing times ... fewer mistakes, mis[illegible] re-runs ... less management dependency on operations personnel.

In short, a smoother running, better performing data center; a center where managers get the most intensive use of all resources. Without making a major capital investment in additional CPUs or peripherals.

We don't believe there's a more cost-effective way to improve the performance of your data center or the value of its position in your company. Call us and find out why more than 1500 users agree.

Value Computing Software Systems:
DCMS—The most powerful and [illegible]ensive production scheduling [illegible]rol system available.
[illegible]-Charge—The industry standard in [illegible]ting and computer billing.
VALU-LIB—An entirely new tape management system designed for today's VS environments.
SMF Express—A unique package for the management of important SMF data.

VALUE COMPUTING
THE OPTIMUM SOFTWARE FOR DATA CENTER MANAGEMENT

Astute release said to provide data set control

Astco has announced Release 2.2 of Astute, its data set and catalog management system for IBM MVS and OS/VS1 users.

The main element of this release is the Personal Data Set Manager function, which is said to allow users control of their data sets by providing an interactive handle on all other Astute functions.

Individual data sets may be selected and scratched, renamed, cataloged or browsed. An IBM Interactive System Productivity Facility (ISPF) interface is provided that allows execution of ISPF browse and edit functions on any selected data set and also allows any C list or program to be invoked, the company said.

Also included is a C list interface that provides for interaction between Astute and C lists running under ISPF. Commands may be passed to Astute via C list variables; Astute may be directed to store extracted information in C list variables; and any C list may be invoked as an exit.

Astute is priced at $7,000 for the first CPU; multi-CPU and multisite discounts are available. A site license is also available.

Astco, 926 Amarillo Ave., Palo Alto, Calif. 94303.

SYSTEMS SOFTWARE

AMALGAMATED SOFTWARE OF NORTH AMERICA, INC.
Price change for Acceler8

Amalgamated Software of North America, Inc. plans to discontinue discounts to volume purchasers of Acceler8, a utility for the IBM System/34.

After March 31, volume purchasers will pay $3,300 for the utility, which is said to speed random index processing significantly. Users can rent the utility for $150/mo.

Amalgamated Software of North America, P.O Box 1068, Malibu, Calif. 90265.

DUQUESNE SYSTEMS, INC.
Catalog Performance Optimizer

Duquesne Systems, Inc. has announced its Catalog Performance Optimizer (CPO), designed to improve throughput and response time in IBM MVS systems.

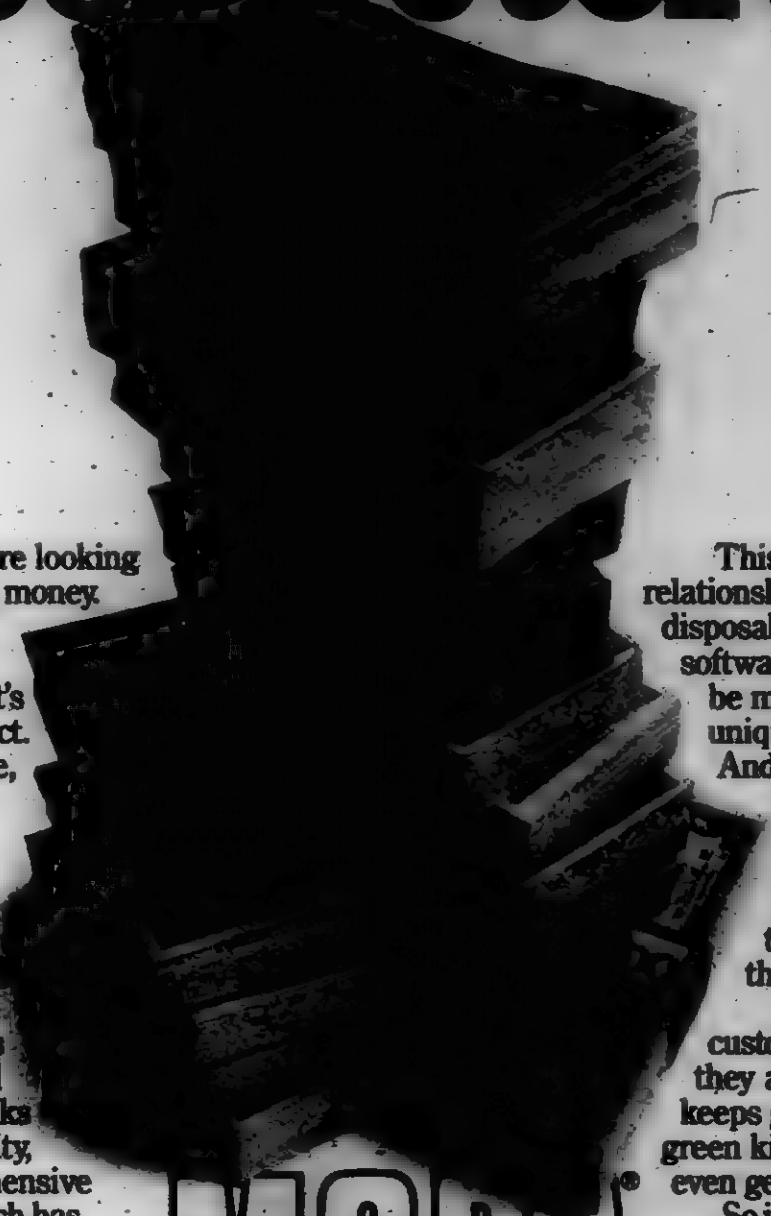
MCBA is looking for some professional bill collectors.



More specifically, we're looking for some dealers who like money. Lots of it. Because when you carry our powerful, field-proven software, that's exactly what you can expect.

Why? It's quite simple, really. The quality of MCBA's library of 17 modular manufacturing, distribution, and accounting packages is attested to by over 15,000 users worldwide. In fact, it's really the only serious software of its kind available for mini and micro environments. Thanks its modularity and flexibility, not to mention its comprehensive documentation. All of which has helped us develop and maintain successful relationships with dealers like you for over 10 years now.

This means you can establish a relationship with us and have at your disposal a comprehensive library of software packages. All of which can be mixed or matched to suit the unique needs of your customers. And as your customers grow, they'll come back to you for more business. Because you can expand their systems with totally integrated packages that work with each other like the movement in a Swiss watch.

So no matter what size your customers are now, or what size they are tomorrow, your business keeps growing. And the bills (the green kind) keep pouring in. It might even get embarrassing.

So if you're a dealer who's in it for the money, call MCBA now at (818) 957-2900. You may not end up being famous. But you could end up rich.

MCBA®

Software that grows on you. And with you.™

2441 Honolulu Avenue, Montrose, California 91020

For HP, Wang, DEC, and TI minis and UNIX, and RM/COS-based micros.

SOFTWARE & SERVICES

Continued from page 72

CPO intercepts catalog management calls and maintains a list of control-volume entries, the vendor said.

According to the vendor, CPO reduces I/O and CPU overhead required for master catalog searches.

CPO runs on MVS and MVS/XA on IBM 30 series and 370 mainframes, the vendor said.

The product is priced at $7,500, with an introductory price of $5,000 in effect until May 31.

Duquesne Systems, 2 Allegheny Center, Pittsburgh, Pa. 15212.

SPECIALIZED SYSTEMS CONSULTANTS
Unix Command Summary; VI Reference

Specialized Systems Consultants (SSC) has announced two additions to its packet of references for users of the Unix operating system.

The Unix Command Summary includes the commands covered in the Unix Users Manual for Release III and provides examples of common commands and shell references. It costs $6.

The VI Reference, is a reference of commands and options for University of California at Berkeley's Visual Editor. It costs $2.50

SSC, P.O. Box 7, Seattle, Wash. 98125.

NITTANY SYSTEMS, INC.
Westicon

Nittany Systems, Inc. has announced Westicon, a program that converts Westinghouse Electric Corp. Westi terminals into IBM CICS terminals.

The software allows the user to run programs written for Westi under CICS without rewriting the application program or running two monitors concurrently, according to the vendor.

The package costs $15,000 for a perpetual license; an optional annual maintenance fee lists for 10% of the cost.

Nittany Systems, P.O. Box 452, Boalsburg, Pa. 16827.

PROGRAM ACCOUNTABILITY & EVALUATION, INC.
Tuner/38

Program Accountability & Evaluation, Inc. has introduced a performance tuner utility program for the IBM System/38.

Tuner/38 addresses such problems as excessive access paths, large subfiles and unstructured high-level language programs. Features include ability to adjust pool sizes and activity levels gradually and allocate core to the subsystem pools that need it the most.

Tuner/38 is available from the vendor for $650.

Program Accountability & Evaluation, 7 Riverway Road, Salem, Mass. 01970.

BRADMARK COMPUTER SYSTEMS, INC.
Dbcopy II modules

Bradmark Computer Systems, Inc. announced that users can buy individual modules, rather than a complete system, for Dbcopy II, a data base utility for the Hewlett-Packard Co. HP 3000 minicomputer.

Dbcopy II features data set purging, data set rebuilding, detail chain integrity testing and dynamic broken chain restoration. It can reportedly restore a data base or a data base subset from a store or sysdump.

Dbcopy II consists of three utility modules: capacity change, which costs $1,000; complete structural features, priced at $2,500; and standard copying feature, available for $2,000. The complete package is available for $3,500.

Bradmark Computer Systems, 4446 Main St., Buffalo, N.Y. 14226.

ADVANCED SYSTEMS CONCEPTS, INC.
Vaxwatch

Advanced Systems Concepts, Inc. has announced Vaxwatch for Digital Equipment Corp.'s VAX-11 computers.

Vaxwatch is said to allow a user to inspect or modify any terminal session under DEC's VMS operating system. The program will connect into the I/O streams of the "watched" terminal and then log all output into a disk file or another terminal.

Vaxwatch can also be made to observe the terminal from which it was started. If the console is placed in "watch" mode, a listing of all systems events can be captured.

The program can be made to observe a terminal session and dynamically log events to disk on command without interrupting the current process.

Vaxwatch runs under VMS version 3.0 or later and is priced at $495.

Advanced Systems Concepts, 22 Hudson Place, Hoboken, N.J. 07030.

GREENE SOFTWARE
Queue/34

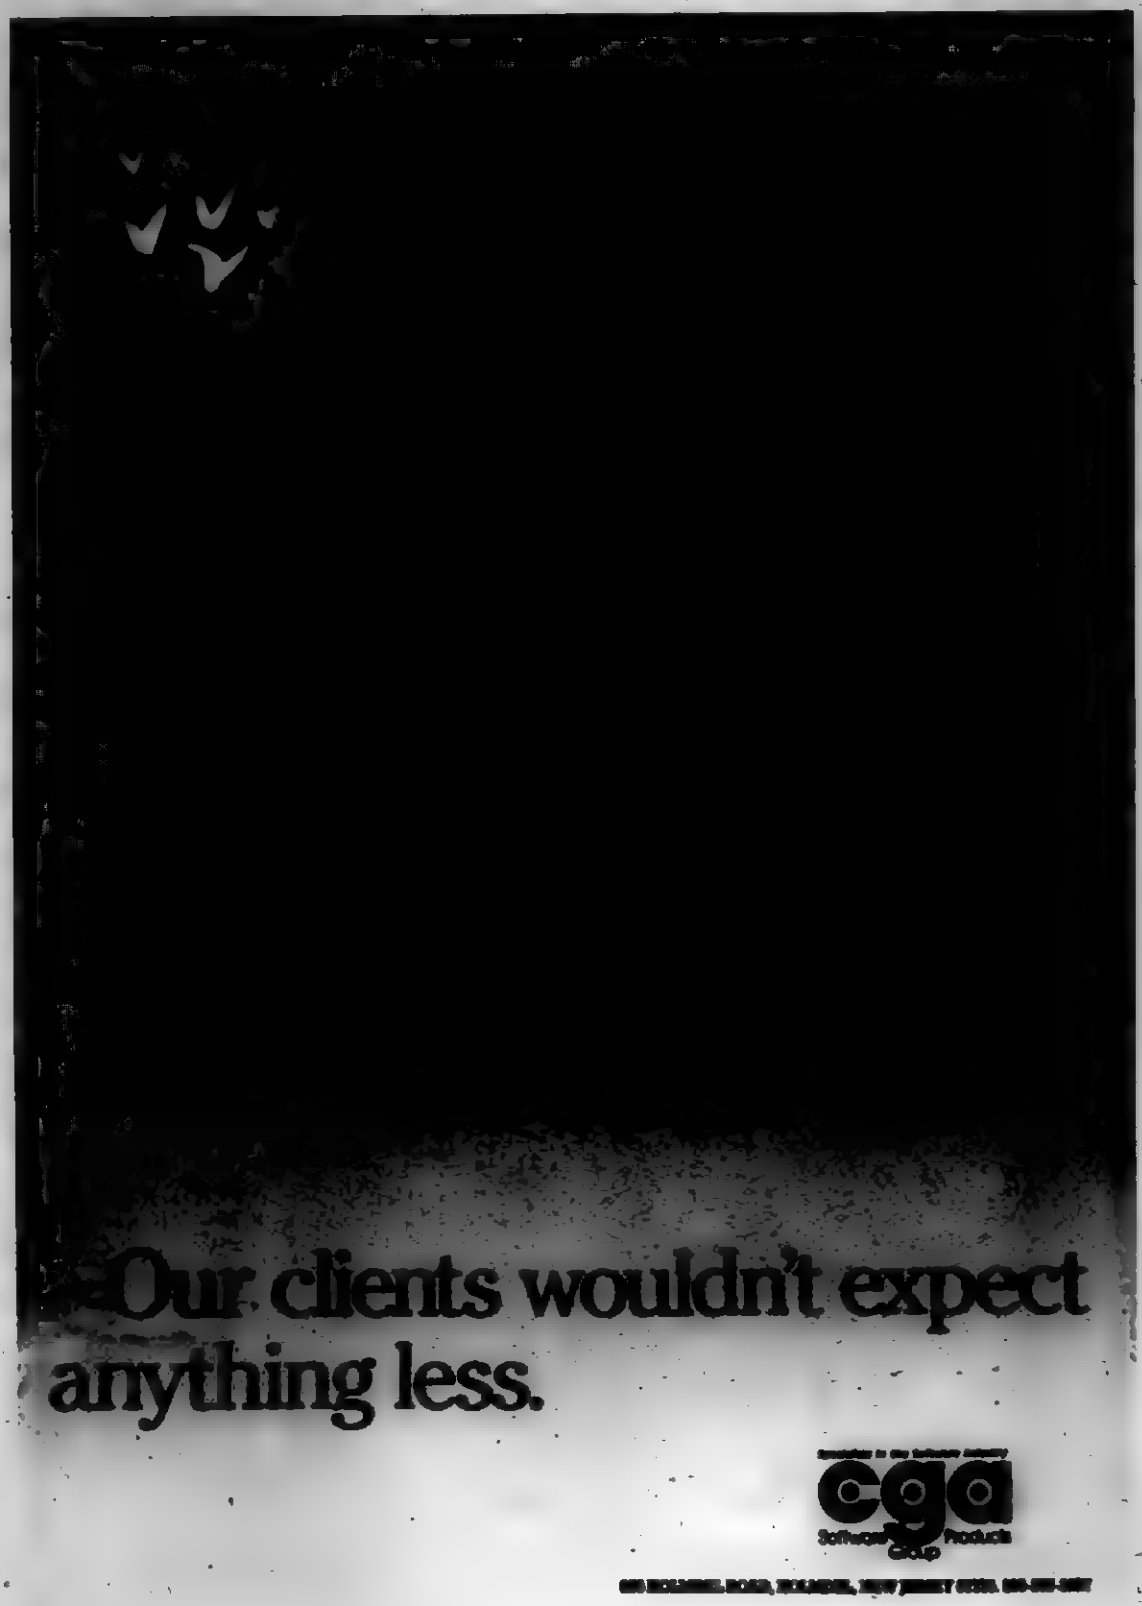
Greene Software has announced Queue/34, which the vendor described as a productivity tool for the IBM System/34.

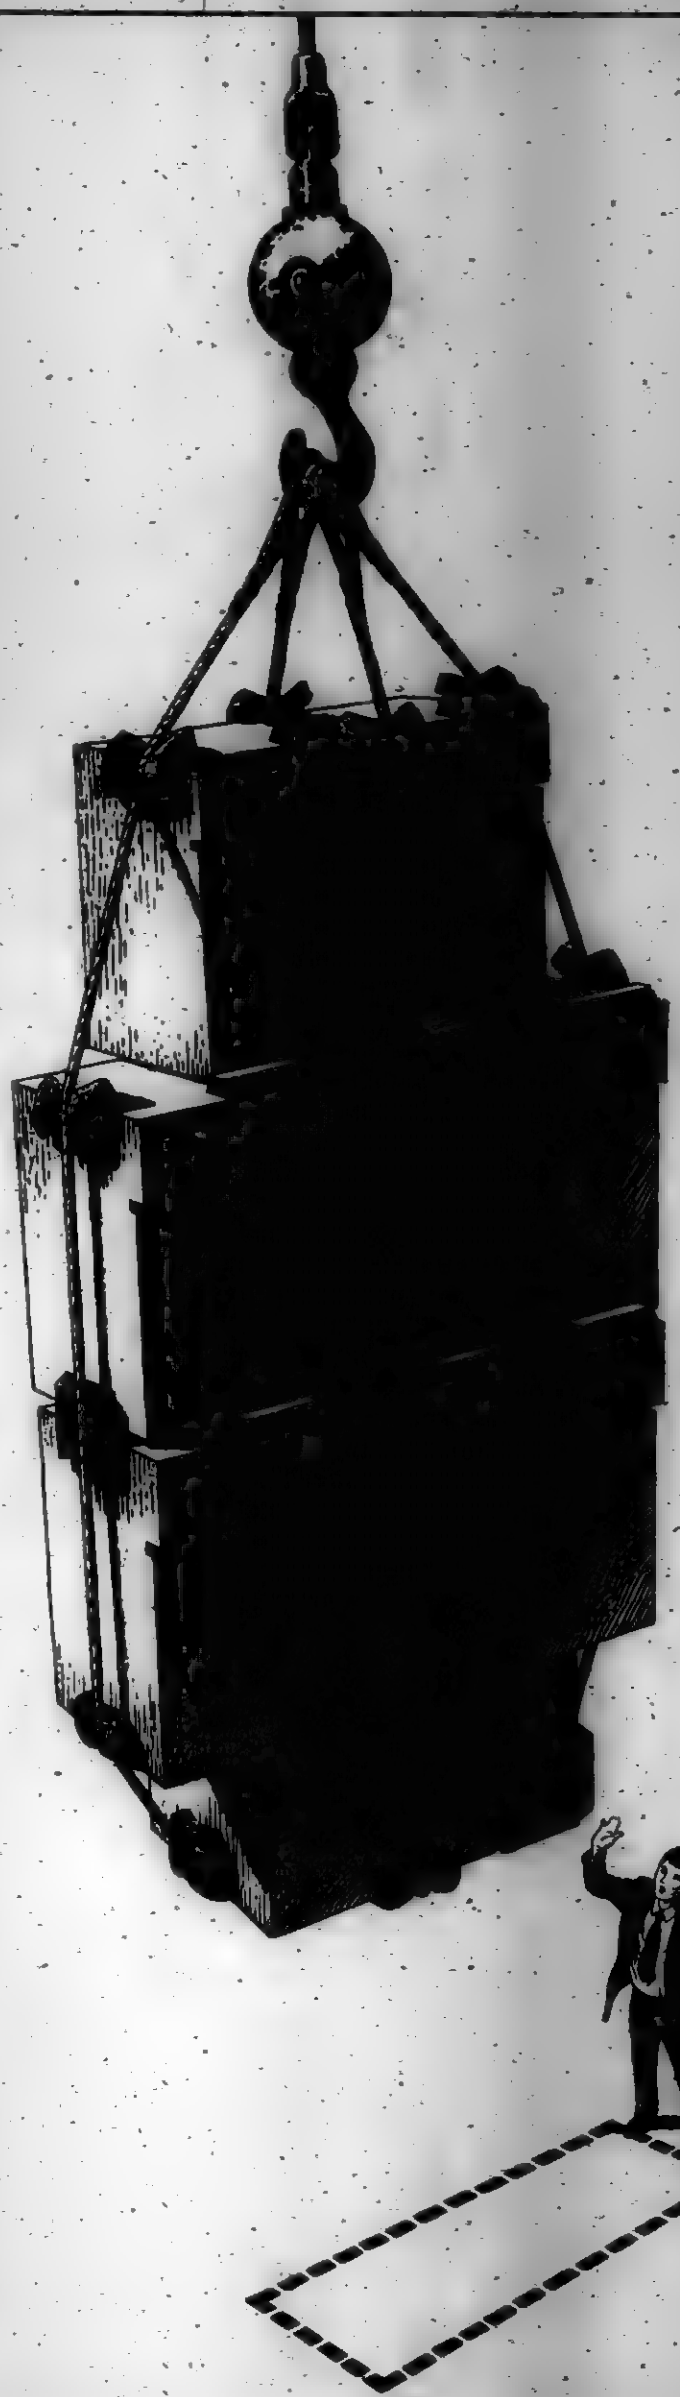
Queue/34 is said to establish an auxiliary batch job queue that allows user jobs to run independently of and concurrently with jobs in the System/34 job queue. The utility reportedly improves utilization of system resources and increases total throughput of the System/34.

The product also includes a set of Help screens. Users reportedly have control of their jobs' positions in the queues, status, start time, execution priority and completion messages through interactive screens. Queue/34 is available for a one-time license fee of $295/CPU.

Greene Software, P.O. Box 23, Victor, N.Y. 14564.

See SOFT page 79





How to put 640 square feet of computer disk storage in a 7′ x 3′ space.

There's no way to store that much data in that little space if you're using disk drives. Even 3380 class. But Masstor Systems' M860 Mass Storage System — a different kind of data storage technology — can solve the problem.

The entry-level M860 stores 55 billion bytes of data on-line and can be expanded to 440 billion bytes. At one-quarter the cost of disk. And less than 4% of the floor space. It also automates tape operations, making processing much faster and more economical.

The M860 is a third storage alternative for your IBM and other plug compatible mainframes. One that offers more on-line storage capacity for your new applications and requires no conversion of your existing programs. Masstor has an M860 solution for Sperry, Honeywell, DEC/VAX and CDC mainframes, too. As well as a way to hook them together in a network: MASSNET.

The M860 and MASSNET are two of a family of Masstor Systems' strategic products that allow you to move, store and share data efficiently and economically.

To find out more, contact Dave Ball at Masstor Systems Corporation, 5200 Great America Parkway, Santa Clara, California 95050. (408) 988-1008. And cut your data storage problems down to size.

MASSTOR SYSTEMS

Strategic solutions to moving, storing and sharing data.

VM/CMS

USERWARE™

A Family of VM Products

SO ADVANCED IT'S SIMPLE

In just 60 days over 100 sites installed the Simple Approach.

BACKUP/CMS
THE SIMPLE APPROACH TO BACKUPS
(VM/CMS Minidisk Backup/Restore Facility)

- Interactive use
- Incremental & full backup capability
- Dynamic password acquisition
- Tape management interface
- Online catalog allows a restoration with only two commands: a FIND and a RESTORE
- No batch processing of any kind

TAPELIB/CMS
THE SIMPLE APPROACH TO TAPE MANAGEMENT
(VM Tape Management Facility)

- Interactive commands
- Full support for SL or NL tapes
- Capability to share tapes
- OS/DOS tape management interface
- Manages tape drive allocation and tape requests
- Active tape catalog
- Full management & audit reports

PPT/CMS
THE SIMPLE APPROACH TO PROGRAMMER PRODUCTIVITY
(VM Programmer Productivity Tools)

- SECURE
- TSCAN
- MODZAP
- TAPECOPY
- SEARCH
- SCRATCH

- All three products can be installed and working for you in the same day, thus saving you valuable time, tape, manpower and computer resources.
- An easy to use online help facility is included with each product.
- No modifications to your VM system are required.
- VM/SP release 3.0 support available.

For under $10,000, you can put all 3 Userware™ products to work in your shop today! Why pay more?

DBMS from page 69

to operate on the units of data (segments, records and the like) of a data base rather than on the entire data base. The primary thrust is toward on-line systems, with fast, limited access of data.

Mixing the three criteria is quite challenging. The result is a system that is useful for operational control of a company. Not surprisingly, the high-performance DBMS environment is quite complex.

Reading between the lines of IBM's announcements of IMS Fast Path (for IMS 1.3) would indicate that IBM intends to fill the future needs for high- performance software with Fast Path.

The first-quarter 1984 enhancements of Fast Path extend the capabilities of the previous version significantly. The migration from IMS Full Function to Fast Path is an evolutionary one, not a revolutionary one.

While high-performance DBMS have many operational capabilities, in general they must be used very carefully as they are difficult to change. What is springing up in the void are decision support data base software packages that serve a different audience. Decision support software is easy to change and easy to use in developing new systems.

This software is especially appropriate for unstable environments where the basic form of data is subject to constant and unpredictable change. The difficulties with the long development cycles that are common to high-performance systems are not the same in the decision support environment.

The decision support environment is optimized to manipulate entire data bases in a single request and, to a lesser extent, the units of data within the data base. While there are certain on-line characteristics of decision support software, most of it is designed to operate in a batch or sequential mode.

The decision support environment is optimized to manipulate entire data bases in a single request and, to a lesser extent, the units of data within the data base.

In environments where there is more than a moderate amount of activity and/or where there are large amounts of data, the activities are restricted to limited queries of data. The full range of decision support activities such as updates, large scans of data and other activities requiring many resources are batched and run at night in a sequential mode. Decision support software is typified by IBM's recently announced relational software.

The route from IMS Full Function to relational is made easy by common

See DBMS page 78

AT THE FOREFRONT OF THE REVOLUTION IS THE MULTIFUNCTION WORKSTATION.

THE DATAPOINT 8600.

DATAPOINT

We sparked the re

DBMS from page 76

calls and by extract and load facilities. Like the migration to Fast Path, the path to IBM's relational system is evolutionary.

If the very definition of data base is splitting into two directions, what does that portend for existing IMS Full Function applications? By virtue of the fact that there are literally billions of dollars of full-function applications in existence today, there is a momentum that will not easily change.

Vendor support

What will happen is that as full-function applications reach the end of their life cycle, there will be encouragement by vendors to rebuild the applications in modes other than full function.

High-performance and decision support software will almost certainly not share the same mainframes. If there is a sharing of these resources, it will most likely be on a "duplexed" basis, where the systems run during certain hours of the day in one mode and at other times in another mode. The basic operating characteristics of the systems are such that they are mutually exclusive.

High-performance and decision support systems will share data by means of a "pipeline" connecting them. Entire data bases or large masses of activities will flow from the high-performance environment on a periodic basis.

Reverse data flow

Limited amounts of data will flow in the reverse direction and under stringent conditions. The reverse flow of data will enter the high-performance environment through the sequential capabilities of the high-performance environment as seen in Figure 2 on page 76.

The two types of DBMS operate in essentially different modes, and there will necessarily be wholesale duplication of data between the modes. Within the same mode of operation, there will be an absolute minimum of data duplication.

The direction of other ven-

'Whether the system comes in any other color than beige is not a technical question.'

dors toward the multiple DBMS environment is not as clear as IBM's. The advertisements indicate that the direction is toward both high-performance and decision support at the same time. If that is the case, then Cullinet Software, Inc.'s IDMS appears to be heading for the old idea of a full-function DBMS being all things to all people.

Other DBMS vendors seem to have a more directed pur-

'There is a momentum that will not easily change. . . . What will happen is that as full-function applications reach the end of their life cycle, there will be encouragement by vendors to rebuild the applications in modes other than full function.'

suit of their niches in the marketplace. These include Computer Corp. of America's Model 204, Mathematica Product Group, Inc.'s Ramis, Information Builders, Inc.'s Focus and others.

Those companies with a clear vision of where their role lies in the mainstream of evolution will prosper, whereas those without a clear understanding of the forces of evolution will wither.

Inmon is a director at Coopers & Lybrand in Denver, an author on the subject of data base design and a regular contributor to Softline.

SOFTWARE & SERVICES

SOFT from page 74

VIRTUAL MICROSYSTEMS, INC.
HP Bridge

Virtual Microsystems, Inc. has announced HP Bridge, a board that allows Hewlett-Packard Co. HP 3000 superminicomputers to run Digital Research, Inc.'s CP/M operating system.

The bridge includes a Zilog, Inc. Z80 microprocessor, software utilities for translating data and a license for CP/M, according to a spokesman for the vendor. With the bridge, any HP 3000 terminal acts like a dedicated microcomputer, the spokesman said.

The board and system software to run the board cost $5,000 each.

Virtual Microsystems, Suite 720, 2150 Shattuck Ave., Berkeley, Calif. 94704.

DYLAKOR
Dyl-Security

Dylakor has announced Dyl-Security, said to be a high-speed, re-entrant implementation of the National Bureau of Standards Data Encryption Standard algorithm.

According to the vendor, the system handles most encryption needs with three coding modes and two short block padding modes. It can be invoked with a call verb or its equivalent, and vendor test results indicate that Dyl-Security can encrypt over 90K byte/sec on the IBM Model 3033 processor.

Dyl-Security contains two assembly language modules: encryption and decryption. They can be called in a Cobol or assembler program, or in Dylakor's host languages — DYL-260, DYL-270 and DYL-280.

Dyl-Security is available for IBM's OS, DOS and SSX operating systems on IBM Models 360 and 370, the 30 series, the 4300 series and plug-compatible mainframes. It is priced at $1,000, plus optional maintenance.

Dylakor, 17418 Chatsworth St., P.O. Box 3010, Granada Hills, Calif. 91344.

SIGNAL TECHNOLOGY, INC.
Resource accounting system

Signal Technology, Inc. has announced that its project-based resource accounting system for Digital Equipment Corp. VAX-11 computers can be purchased separately. Previously, the software package could be purchased only in conjunction with the vendor's Process Accounting and Chargeback system software.

The software package reportedly provides three reporting levels for account name, user name and project name. The same user name can be used for multiple projects, and each project name/user name combination can have its own default directory, a spokesman said.

The package ranges in price from $1,000 to $2,200.

Signal Technology, 5951 Encina Road, Goleta, Calif. 93117.

BUSINESS SUPPORT SYSTEMS, INC.
Columnizer

Business Support Systems, Inc. has introduced a software chart program said to simplify the inputting and editing of multicolumn documents on Wang Laboratories, Inc.'s OIS system.

According to the vendor, Columnizer enhances Wang word processing software by eliminating word wrap-around when working with multicolumn applications.

The program features automatic generation of vertical and horizontal lines, the ability to move columns vertically and horizontally, support of up to 15 columns of data, support of columns and row headings and the ability to save specifications for repetitive applications.

FALCON
on-line data entry that's above and beyond the ordinary

For an easy-to-use, completely interactive data entry system that's designed especially for the end user, you need FALCON.

FALCON operates standalone or as a task under CICS and the other major TP monitors giving you total flexibility and performance. It supports both DOS and OS operating systems to provide versatility and upgrading capabilities. And FALCON automatically converts VIDEO/370 formats.

FALCON's high-level security system protects your data against unauthorized access. It lets you decide which operators can use specific functions. And with FALCON you never worry about losing data. If the system fails, all data is recovered. If a terminal breaks down, just go to another terminal, rescue your data, and start working – right where you left off.

FALCON's on-line instructions help you design screen formats, enter and verify data, maintain files, create tables, and submit your own jobs. Just touch a key, tell FALCON what you want to do, and the instructions appear right on the screen.

With FALCON, you can make decisions based on the productivity of your operators without leaving your office.

You can monitor the progress of all active terminals and view job accounting statistics on-line.

FALCON's built-in edits include table lookup, range testing, defaults, balancing, and much more. FALCON goes far beyond other data entry systems to let you use your terminal as an operator's console and view the activity and contents of the input and output queues.

So make sure you're getting the most from your resources. Choose FALCON. Call for a free trial. You'll be glad you made the right choice.

A permanent license costs $495 for the OIS Master CPU and $1,200 for Wang's Wise Network of four or more CPUs.

Business Support Systems, Suite 102, Executive Place V, 60 Mall Road, Burlington, Mass. 01803.

LOGISTIKOS, INC.
Menu Facility

Logistikos, Inc. has announced Menu Facility, an interactive, menu utility for the IBM System/38 minicomputer.

The menu format allows users to display 96 items in single- or double-col. format, the vendor said. Security features reportedly include password assignment to any menu or menu item, time restriction for certain menu items, tracing of any item and automatic logoff for unused terminals.

Menu Facility costs $495.

Logistikos, Suite 920, One Michigan Ave., Lansing, Mich. 48933.

RD LABS, INC.
RD/Share Release 2.0

RD Labs, Inc. has announced a release of its RD/Share program library management system for the IBM VM/CMS environment.

RD/Share Release 2.0 is said to manage the CMS update facilities allowing for maintenance of multiple levels of change files and effective version control. Enhancements reportedly include improved management reports and an on-line Help facility, support for IBM OS, DOS and CMS targeted compilations, compressed file support and improved documentation.

RD/Share Release 2.0 is priced at $5,475 for a permanent license and $455/mo for lease. It also is available on a rental plan.

RD Labs, P.O. Box 25582, 1779 Tribute Road K-1, Sacramento, Calif. 95865.

SOFTWARE TECHNIQUES, INC.
UTL

Software Techniques, Inc. has announced UTL, a multifunction system utility for processors running under Digital Equipment Corp.'s RSTS/E operating system.

UTL provides on-line control of system operation, replacing seven utilities with one program to save processing time and system memory. UTL incorporates the RSTS/E functions of Utility, Ttyset, Systat, React, ATPK, Umount and Shutup.

The UTL system is priced at $350.

Software Techniques, 5242 Katella Ave., Los Alamitos, Calif. 90720.

SDI
Universal File Portability

SDI has introduced Universal File Portability (UFP), a product which allows interchangeability of storage media with no program changes, recompilation or relink required.

As an introductory offer, UFP is available to SDI software users free of charge and to new customers at a cost of $90/mo on a two-year basis.

SDI, 1700 S. El Camino Real, San Mateo, Calif. 94402.

PRODUCTIVITY AIDS

XXCAL, INC.
XXCalibration

XXCal, Inc. has announced a software testing and evaluation service designed to identify software bugs and suggest improvements before marketing.

With XXCalibration, software authors can test programs for as long as several days and receive a third-party report on technical shortcomings — such as programming and documentation errors — and on nontechnical concerns like ergonomics.

Prices are determined by the complexity of the program, beginning at $30 per man-hour for general-purpose word processing software.

XXCal, Suite 114, 2001 S. Barrington Ave., Los Angeles, Calif. 90025.

See AIDS page 84

What three letters represent the most powerful on-line computer in business today?

TX

The most powerful on-line

Time was, the answer to the previous page was as easy as ABC.

But that was yesterday.

Today, the world of business computing is being introduced to a system featuring over two-and-a-half times the performance and twice the price/performance of its nearest competitor.

A versatile system. Able to compile the information of the largest corporations into a single relational data base. Instantaneously updated and fully available across the entire system.

An expandable and compatible system. Allowing the simple addition of future programs and equipment, without sacrificing past investments.

And most importantly, a system that won't let you down. Because its fault-tolerant design won't let itself down. Even if a major component fails.

This system isn't from IBM.

It's from Tandem.

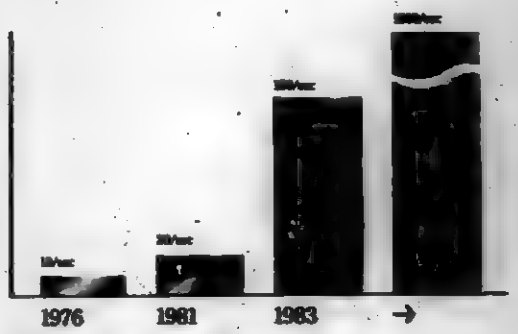
Introducing the NonStop TXP™ system.

TXP: 32-bit transaction processing.

The TXP system processes high volume loads faster and more economically than any other system. Executing over 100 transactions per second now and thousands of transactions in the near future.

It's built around multiple parallel 32-bit processors. Each addressing 16 MB of physical memory and over a gigabyte of virtual memory.

To help memory keep pace with that kind of processing, TXP pulls 64 bits on each memory access.



Our success can be summed up in a second. *Transactions per second. Numbers unsurpassed in the industry. On-line systems that fit your needs today. And tomorrow. With more processing power on the way.*

The TXP system also features parallel data paths. Manipulating 32 bits of information in a single cycle, two 16-bit operations in the same cycle.

And TXP incorporates extensive pipelining, to process multiple instructions simultaneously. Each processor overlaps instructions in three levels: Fetching one, while preprocessing a second, while executing a third.

While helping TXP deliver full 32-bit power, for less.

Cache memory pays off in faster response times.

Cache memory is a high-speed data storage area between the processor and main memory. It lets the processor store more frequently used information closer. So it can get to it faster.

And our tests have shown that the TXP cache memory has a 98% "hit rate." Which means the requested data is virtually always nearby for fast access.

The result? Larger volumes of work can be processed in shorter amounts of time. Helping TXP to be even more productive.

Making cache memory pay big dividends.

A system you'll expand, not disband.

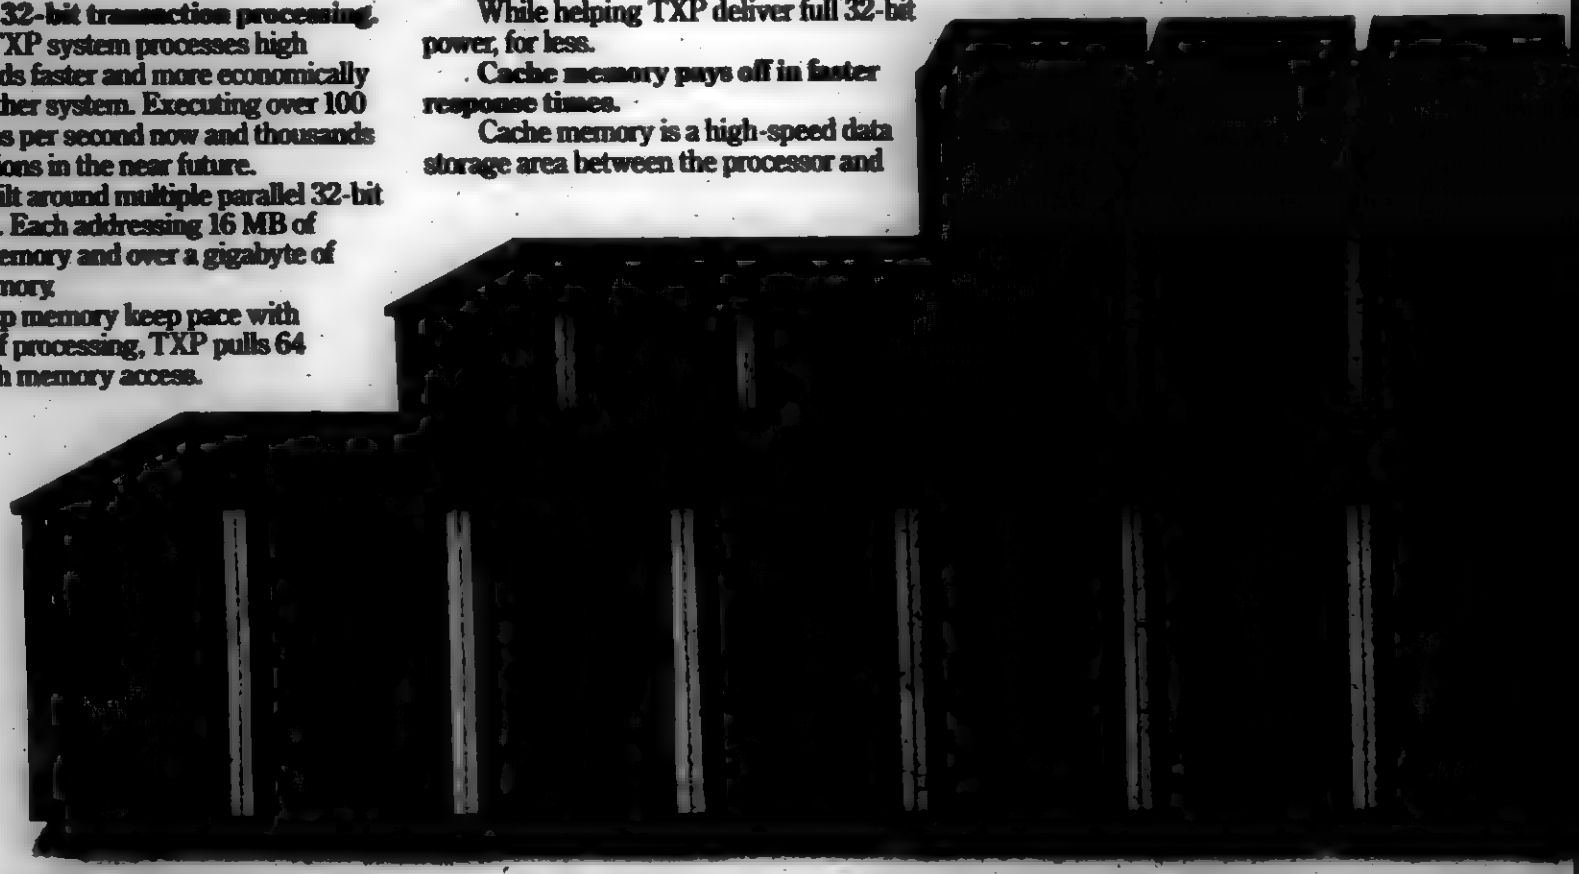
Most computer systems have very limited expandability. So if a company outgrows its computer's capacity, it usually means starting again from scratch.

Selecting and buying a larger and more expensive system.

Then reprogramming.

Then re-training.

Plus all the chaotic disruption and



XP

computer in business today.

massive loss of revenue that's unavoidable during the switch-over.

Not so with the TXP system.

It can expand from two to 16 processors. Increasing its power by a factor of eight.

That's more power than any of the largest mainframes.

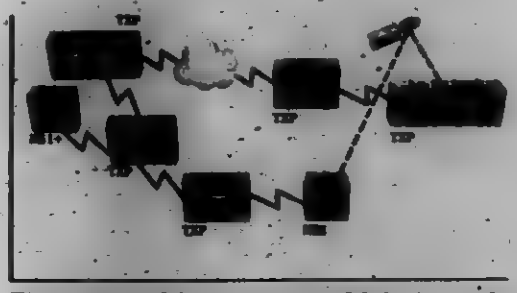
And the additional processors can be installed while TXP is running at full speed. No downtime. No reprogramming.

Still not enough power? Up to 14 TXP systems can be joined together by high-speed fiber optics. Linking the systems together as one computer with 224 processors.

But that still isn't the full potential of the TXP.

TXP systems at up to 255 sites can be joined in a worldwide network. Generating the power of over 4,000 processors.

And that gives TXP the most powerful on-line computer capacity in business.



The most powerful computer network in business today. Users access a single unified global data base from any of thousands of terminals anywhere in the system.

Expandability our competition wishes they could disband.

NonStop™ system compatibility from the people who started it all.

TXP can process more information and support more programs, users and devices than any other computer designed for on-line transaction processing.

Devices you most likely already have.

Even devices made by IBM.

But what if your company isn't quite ready for the TXP system's awesome power?

We suggest the Tandem NonStop II™ system. The second most powerful on-line computer in business today. The cost effective solution for medium to large corporations.

What if your company is somewhere between a Nonstop II and a TXP?

No problem. They can be combined. They can share the same data and programs. In fact, NonStop II and TXP processors can coexist in the same cabinets.

And what if your company needs even a smaller computer? We make a smaller computer. The Tandem NonStop 1+ system. Perfect for those low-volume sites where less processing power is needed.

Tandem literally wrote the book on NonStop™ transaction processing. That's because we introduced the first NonStop system.

Over eight years ago.

And for over eight straight years, despite attempts by others, we've continued to lead the industry.

Learn all about TXP, ASAP.

For complete literature, contact your local Tandem Sales Office.

Or write Tandem Computers Incorporated, 19333 Vallco Parkway, Cupertino, California 95014.

Or call us, toll-free. (800) 482-6336.

TXP is the most powerful on-line computer in business today.

Without question.

BUSINESS CONTROLS CORP.
SB-5/CDD interface module

Business Controls Corp. has announced a software module that interfaces its SB-5 Automated Cobol Applications Software Development System with the Digital Equipment Corp. Common Data Dictionary (CDD).

The CDD option is included with many of DEC's VAX-11 series of computer installations. The SB-5 is a system of programs that automates design, production, documentation and maintenance of Cobol applications software for DEC's series of VAX-11 systems and for DEC's PDP-11 and Decsystems 10 and 20. The module costs $5,000.

Business Controls, 507 Blvd., Elmwood Park, N.J. 07407.

MICHAELS, ROSS & COLE, LTD.
Maintainer

Michaels, Ross & Cole, Ltd. has announced Maintainer, a program generator for the IBM System/38.

Maintainer features multi-file editing, on-line Help keys, automatic audit trail for any modifications and message file interface. A single CPU license costs $1,140.

Michaels, Ross & Cole, P.O. Box 4533, Oak Brook, Ill. 60521.

PANSOPHIC SYSTEMS, INC.
EZ/Key

Pansophic Systems, Inc. has announced EZ/Key, an integrated prompter and language-sensitive editor for use with its Easytrieve Plus information retrieval and data management system.

According to the vendor, EZ/Key combines a full-function, menu-driven prompter with a full screen editor, allowing flexibility in either mode of operation. A language-sensitive editor checks all statements for errors and is said to eliminate the need for compile runs while building programs.

EZ/Key is designed for use with IBM's TSO, CMS and CICS teleprocessing environments. For CICS, EZ/Key is available in DOS and OS versions priced at $9,000 and $15,000, respectively.

Pansophic Systems, 709 Enterprise Drive, Oak Brook, Ill. 60521.

MCCOSKER CORP.
Program Genie

McCosker Corp. has announced the Program Genie, said to be an on-line application development system for the IBM System/38.

According to a spokesman, Program Genie is designed to assist in the creation of on-line programs for the System/38. The system will create IBM RPG-III on-line programs based on a physical file Data Dictionary System (DDS) member which exists in a defined library and source DDS file.

Program Genie will create both the DDS display specifications and the RPG-III program code to provide on-line update or display capabilities.

Program Genie is licensed for $3,500.

McCosker, 740 Julie Ann Way, Oakland, Calif. 94621.

APPLICATION PACKAGES

COMPUTER ASSOCIATES INTERNATIONAL, INC.
CA-Asset Management

Computer Associates International, Inc. has announced an on-line, interactive accounting system for tracking capital equipment.

CA-Asset Management is designed to run under IBM's DOS and OS operating systems and is the final release in Computer Associates' Financial Management Software Series.

It is intended for use by companies with significant fixed assets. It reportedly tracks a company's assets, updates the general ledger for depreciation calculations, maintains an audit trail and produces reports.

The software is menu-driven with on-line Help screens. It is designed to calculate tax credits for capital equipment and provide "what-if" projections on depreciation. License fees are $27,500 for DOS systems and $30,000 for OS systems.

Computer Associates International, 125 Jericho Tnpk., Jericho, N.Y. 11753.

See PACKAGES page 86

Tear out this coupon before someone rips off your CICS system.

Unauthorized data access and computer crime are problems you can't afford to ignore. And locks, guards and batch protection can't [illegible] CICS system at its most vulnerable [illegible] terminals.

That's why so many companies have turned to GUARDIAN,™ the security software so effective, it's become an industry standard.

GUARDIAN is comprehensive security. You can protect any number of users, terminals, programs, files and data bases in any combination you choose. And GUARDIAN's new techniques make it easy to define protection down to the field level.

[illegible] installation. It also easier than ever to update GUARDIAN for new rules or personnel. Both temporary and permanent changes can now be made on-line. Most importantly, GUARDIAN provides reports in simple English, so it can be administered by non-technical personnel.

To find out more about the CICS security system with a proven track record, just follow the dotted line or call toll-free 800-526-0272. Don't wait.

Inside every RAY-O-VAC Battery there's a NATURAL current.

PACKAGES from page 84

LABORATORY TECHNOLOGIES CORP.
Labtech-PC

Laboratory Technologies Corp. has announced Labtech-PC, a material testing package that includes data acquisition, critical instrument control, display and analysis control modules designed for the IBM Personal Computer.

Materials testing is the measurement of mechanical properties of liquids and solids.

The package uses American Society for Testing Materials standards and analyzes and displays test data in graphics and statistical forms, according to the vendor.

Three cards can be placed in IBM Personal Computer expansion slots: Testmate 1 ($3,500), which provides data acquisition software; Testmate 2 ($5,500), said to include data acquisition and instrument control software; and Testmate 3 ($4,000), which runs either data acquisition or instrument control software.

Laboratories Technologies Corp., 328 Broadway, Cambridge, Mass. 02139.

ABC MANAGEMENT SYSTEMS, INC.
ABC/MM for IBM System/36

ABC Management Systems, Inc. has announced an IBM System/36 minicomputer version of its ABC/MM maintenance management package, previously available only on IBM 370, 4300 and 30 series mainframes.

According to a spokesman, the package is designed for use by manufacturing, processing, utility, gas and oil, transport and industrial, public works, school and hospital facilities. ABC/MM is said to be menu-driven and totally on-line. It combines a common data base and eight integrated program modules which are available separately.

The modules are said to accommodate labor records and time cards, work-order scheduling to available capacity, job estimates and backlog planning, time and accounting performance control, budget control, equipment history, parts and inventory and preventive maintenance. The package requires a minimum of 64K bytes of memory.

ABC/MM is priced between $11,000 and $65,000, depending on the number of modules selected. Maintenance is an additional 10% per year option.

ABC Management Systems, Suite 3, 805 Dupont St., Bellingham, Wash. 98225.

REAL DECISIONS CORP.
1984 'Financial Modeling Decisions'

Real Decisions Corp. (RDC) has announced the publication of the 1984 "Financial Modeling Decisions," which contains reviews of 30 major decision support system products.

In its seventh year of publication, "Financial Modeling Decisions" benchmarks 30 financial modeling software packages with real-life business problems, RDC said. The report tests the products' responses to five classic business problems, including new product planning, cash-flow analysis, long-range planning, sales-driven models and short-term models.

The RDC report displays actual code used to solve portions of each benchmark problem, illustrating the capabilities found in each of the software products.

Separate chapters for each product are said to provide detailed information about capabilities in modeling, "what-if" analysis, data handling, reporting and graphics. The full "Financial Modeling Decisions" report is priced at $995, according to RDC.

Real Decisions, 123 High Ridge Road, Stamford, Conn. 06905.

TRANSCOM DATA SYSTEMS, INC.
Tolas-Salestream

Transcom Data Systems, Inc. has announced an enhancement designed to allow users of the Tolas wholesale and distribution package to provide their salesmen and customers with remote access to host computers.

The enhancement, Tolas-Salestream, reportedly allows direct customer order entries with one-button access from terminals in the customer's place of business and other business functions.

Tolas, which operates on Digital Equipment Corp. VAX-11 and PDP-11 systems, was designed to be customized with the Tolas-Salestream for each user.

It reportedly allows salesmen to use portable terminals to verify item availability, enter orders and provide accurate pricing when calling on customers.

Enhanced versions of Tolas will be available in March.

One-time license fees range from $2,000 to $6,000, depending upon the type of CPU and number of modules, the vendor said.

Transcom Data Systems, 1380 Old Freeport Road, Pittsburgh, Pa. 15238.

FUJITSU SYSTEMS OF AMERICA
7880, 7990 enhancements

Fujitsu Systems of America has introduced two enhancements for its 7880 and 7990 point-of-sale terminals: a dial-out credit authorization system for master terminals or terminal support processors and an interactive post void capability.

According to the vendor, the credit authorization function checks credit, replacing telephone inquiries and searches through credit card control books.

The interactive post void feature requires less entry of information, improving the accuracy of daily totals, a company spokesman said.

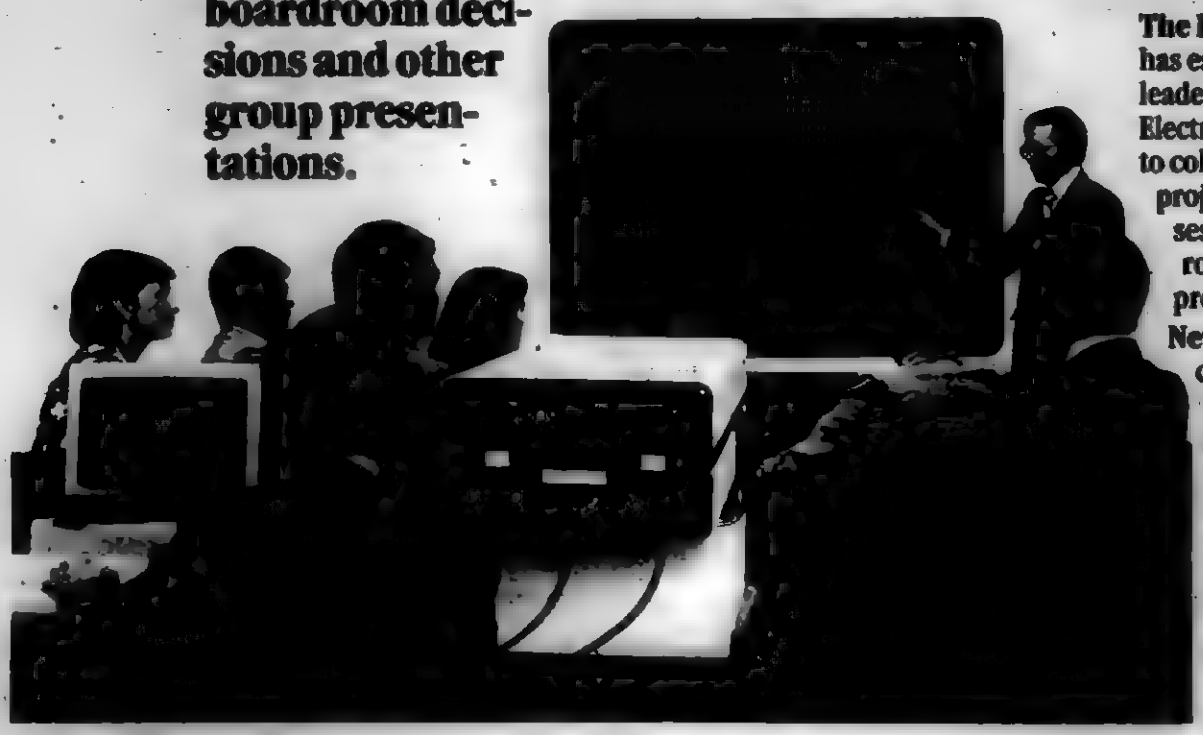
The credit authorization system is priced at $100 per master terminal; the post void is $10 per store-controller.

Fujitsu Systems of America, 3841 Airport Blvd., Los Angeles, Calif. 90045.

NOW ELECTROHOME HAS SIMPLIFIED

Electrohome EDP 57 has achieved worldwide success in monochrome computer projection for training sessions, sales meetings, boardroom decisions and other group presentations.

Now Electrohome ECP 1000 makes it just as easy to project color computer graphics and data or videotapes to big screen size.



The EDP 57 monochrome system has established Electrohome as a leader in computer projection. Now Electrohome is ready for your move to color computers—and your need to project color videotapes in training sessions, sales meetings, boardroom decisions and other group presentations.

New ECP 1000 is so sophisticated, it's simple. You can't imagine how easy it is to set up and operate. Colors are automatically converged in the unit and projected through a single lens—thanks to the Electrohome breakthrough in Laser Aligned Dichroics (LAD).

SOFTWARE & SERVICES

HEWLETT-PACKARD CO.
HP Tex

Hewlett-Packard Co. has announced a document-formatting system for users of its HP 9000 Series 200 16-bit engineering workstations.

Dubbed HP Tex, the package enables users to create and print complex expressions and equations commonly used in scientific and technical fields, according to a spokesman for the vendor. The system utilizes the engineering workstation and the HP 2688A workstation laser printer.

HP Tex accepts text files from the HP 9000 Series 200 computers in stand-alone mode or on HP's Shared Resource Manager, according to a spokesman for the vendor.

Embedded commands can be used to specify formatting features. Page size reportedly can also be specified and printed in a multicolumn format.

The HP Tex formatting system is priced at $4,000. The HP 2688A workstation laser printer is priced at $25,950, and prices for the HP 9000 Series 200 engineering workstation begin at $3,950.

HP, 1820 Embarcadero Road, Palo Alto, Calif. 94303.

MCBA, INC.
Wang M/L

MCBA, Inc. has announced Wang M/L, a mailing-list package written in Cobol for the Wang Laboratories, Inc. Wang VS small business computer.

The Wang M/L interfaces optionally with MCBA's Wang accounts payable, accounts receivable and payroll packages, enabling users to update automatically lists of customers, vendors or employees, according to an MCBA spokeswoman.

The system supports an address list of unlimited size and provides complete letter maintenance, according to the spokeswoman.

In addition, it offers flexible print selection by contact name, company name, Zip Code, date added to the list, date of last change, state, country, source, user-defined codes and status, according to the MCBA spokeswoman.

Source-code licenses for the Wang M/L range in price from $1,500 to $4,000, depending on the Wang VS model.

MCBA, 2441 Honolulu Ave., Montrose, Calif. 91020.

COMPUTER APPLICATION SERVICES
Electronic Mail System

Computer Application Services has introduced the Electronic Mail System (EMS), an application software package which allows users of IBM 3270 series terminals to connect to Telex Corp. Telex and TWX services.

The package adds internal message service to existing IBM 370 and 4300 series mainframe computers running IBM CICS data communications software under IBM OS or DOS operating systems, according to the vendor.

EMS is menu-driven, and the software enables users to reformat and retransmit messages and to retrieve and transmit existing business records without rekeying, according to the vendor.

The software will accommodate up to 100,000 mailboxes and can handle messages as large as 10,000 lines, according to the vendor.

The price is $8,900 for CICS running under OS and $7,500 for CICS running under DOS. The product is marketed by Marc Rubin & Associates.

Marc Rubin & Associates, Suite 210, 12535 Seal Beach Blvd., Seal Beach, Calif. 90740.

HEWLETT-PACKARD CO.
HP Pay

Hewlett-Packard Co. has announced HP Pay, a payroll software package for its HP 3000 line of computers.

The vendor said the system's interactively maintained tables can be tailored to meet user needs, a process that requires no modification of source code or recompilation of code. The system provides menus and interactive screens; real-time updates of data are on-line for review upon data entry.

HP Pay is integrated with HP General Ledger. Data accumulated in HP Pay files can be incorporated in general ledger reports and quarterly and yearly statements, the vendor said.

Provisions are included in the system for all standard U.S. and Canadian government reports.

HP Pay is bundled with implementation assistance and one year of tax information updating. The bundled system is priced at $21,400.

HP, 3000 Hanover St., Palo Alto, Calif. 94304.

GOAL SYSTEMS INTERNATIONAL, INC.
Phoenix Release 4.1

Goal Systems International, Inc. has announced Release 4.1 of the Phoenix System, which the vendor described as a computer-based training system for IBM mainframe and plug-compatible system users.

The new release reportedly features automatic terminal allocation which allows a user to write a sign-on logo, activate automatic registration of terminals, require users to enter account numbers for billing and control display of input fields.

The Phoenix system reportedly provides quick development of courses without programming, immediate delivery of courses to any terminal in a network and updating of course material. Phoenix provides computer-assisted instruction for teaching skills and operating procedures and computer-managed instruction for testing students' skills and for managing employee training time, company training programs and multimedia resources.

Phoenix operates under IBM's VM/CMS, MVS, VS1 and SVS operating systems. A three-year renewable license is priced at $875 per month.

Goal Systems International, 5455 N. High St., Columbus, Ohio 43214.

See PACKAGES page 88

COLOR COMPUTER PROJECTION.

By comparison, other systems have three lenses and dozens of controls that must be adjusted by trial and error to converge colors on the screen. You have easy one-button switching from high resolution data and graphics to brilliant video with lock-in picture size. Ideal for portable or permanent use and for front or rear screen projection. And you can benefit from the last word in color video projection even before you move up to color computers.

DATA DECISIONS
Mainframe and minicomputer software survey

Data Decisions has published a survey that describes 87 mainframe and minicomputer business administration and management software packages.

The survey includes dot-chart indexes and written descriptions of key features, according to the vendor. Each entry includes the purpose of the program, installation requirements, unique functions, product interfaces, extra-cost options and source code availability, the vendor said.

The survey costs $29.

Data Decisions, 20 Bruce Road, Cherry Hill, N.J. 08034.

TREE SYSTEMS, INC.
Employee Information System/3000 enhancement

Tree Systems, Inc. has announced an enhanced version of its Employee Information System/3000 software package for IBM and compatible mainframes.

With the new release, on-line, real-time payroll and personnel functions include benefits and compensation administration, Affirmative Action planning, position control, labor distribution and Occupational Safety and Health Administration compliance, according to the vendor.

The enhanced on-line capabilities are said to provide immediate access to the employee master file, optional real-time update and data base inquiry.

The package ranges in price from $75,000 to $175,000.

Tree Systems, 16775 Addison Road, Dallas, Texas 75248.

EPS, INC.
FCS-EPS Version 1.03

EPS, Inc. has announced an enhanced version of its FCS-EPS decision support system for Hewlett-Packard Co.'s HP 3000.

Version 1.03 is said to feature

To all reps: Price changes on following items effective immediately: No. 10-11A, 10-114A, 10-A1.

Chris: The latest offer looks better, although it's still not what we were hoping for. Try for another compromise.

Just got the word from Gary. Increased our share by 6%. If trend holds, we'll pass competition by third quarter!

Smartcom II communications software, currently available for IBM PC, DEC Rainbow 100, Xerox 820-II and Kaypro II.

Smartmodem 1200 for all computers with an RS-232C interface; Smartmodem 1200B plug-in board for the IBM PC.

Microcomputer communications? Get control of the situation with

Hayes™

Microcomputer communications can present the DP/MIS staff with a tangle of mis-matched hardware, user-hostile software, and a situation that can quickly get out of hand.

Hayes can help you avert that chaos, with a telecomputing system designed expressly for microcomputers.

A system so advanced, it's downright simple. Economical. And requires no handholding from you.

Hayes. The computer's telephone. Our Smartmodem 300™ and Smartmodem 1200™ connect to any desktop computer with an RS-232C port. They operate with rotary dial, Touch-Tone® and key-set telephone systems. At full or half duplex. And both feature self-test capabilities, as well as indicator lights and built-in speakers for monitoring calls.

The lower-priced Smartmodem 300 is ideal for local data swaps and communicates at 300 bps. A built-in speed selector on Smartmodem 1200 automatically detects transmission speeds (110, 300 or 1200 bps).

Smartmodem 1200B™ is also available as a plug-in board for IBM® Personal Computers. And Hayes manufactures the Micromodem IIe® for Apple® II, III, IIe and Apple Plus computers, as well. It comes packaged with Smartcom I™ communications software.

Speaking of software, more programs are written for Hayes modems than for any other. And that impressive list includes our own incomparable communications software. Smartcom II.™ Complete, menu-driven software for the IBM PC, DEC Rainbow 100,™ Xerox 820-II™ and Kaypro II.™ Even first-time communicators will find success with Smartcom II. Screen prompts guide users in the simple steps it takes to create, send, receive, list, edit, name and re-name files.

Tasks like simultaneously receiving, printing and storing data—completely unattended—are easily managed with Smartcom II, because it takes full advantage of Smartmodem's capabilities.

The program reduces lengthy dial-up and log-on sequences to a single keystroke. It stores communications parameters for 25 remote systems.

Plus, there's an on-line help feature that explains prompts, messages and parameters.

Our reputation speaks for itself. Hayes has five years of solid leadership in the microcomputer industry. Nationwide availability through retail computer stores. Trouble-free factory service and call-in assistance. A limited two-year warranty on all hardware. And the most efficient telecomputing system available. Anywhere.

If you're involved in linking micros or setting standards for configurations, remember this. Everything your people need to know about communications can be summed up in one word: Hayes.

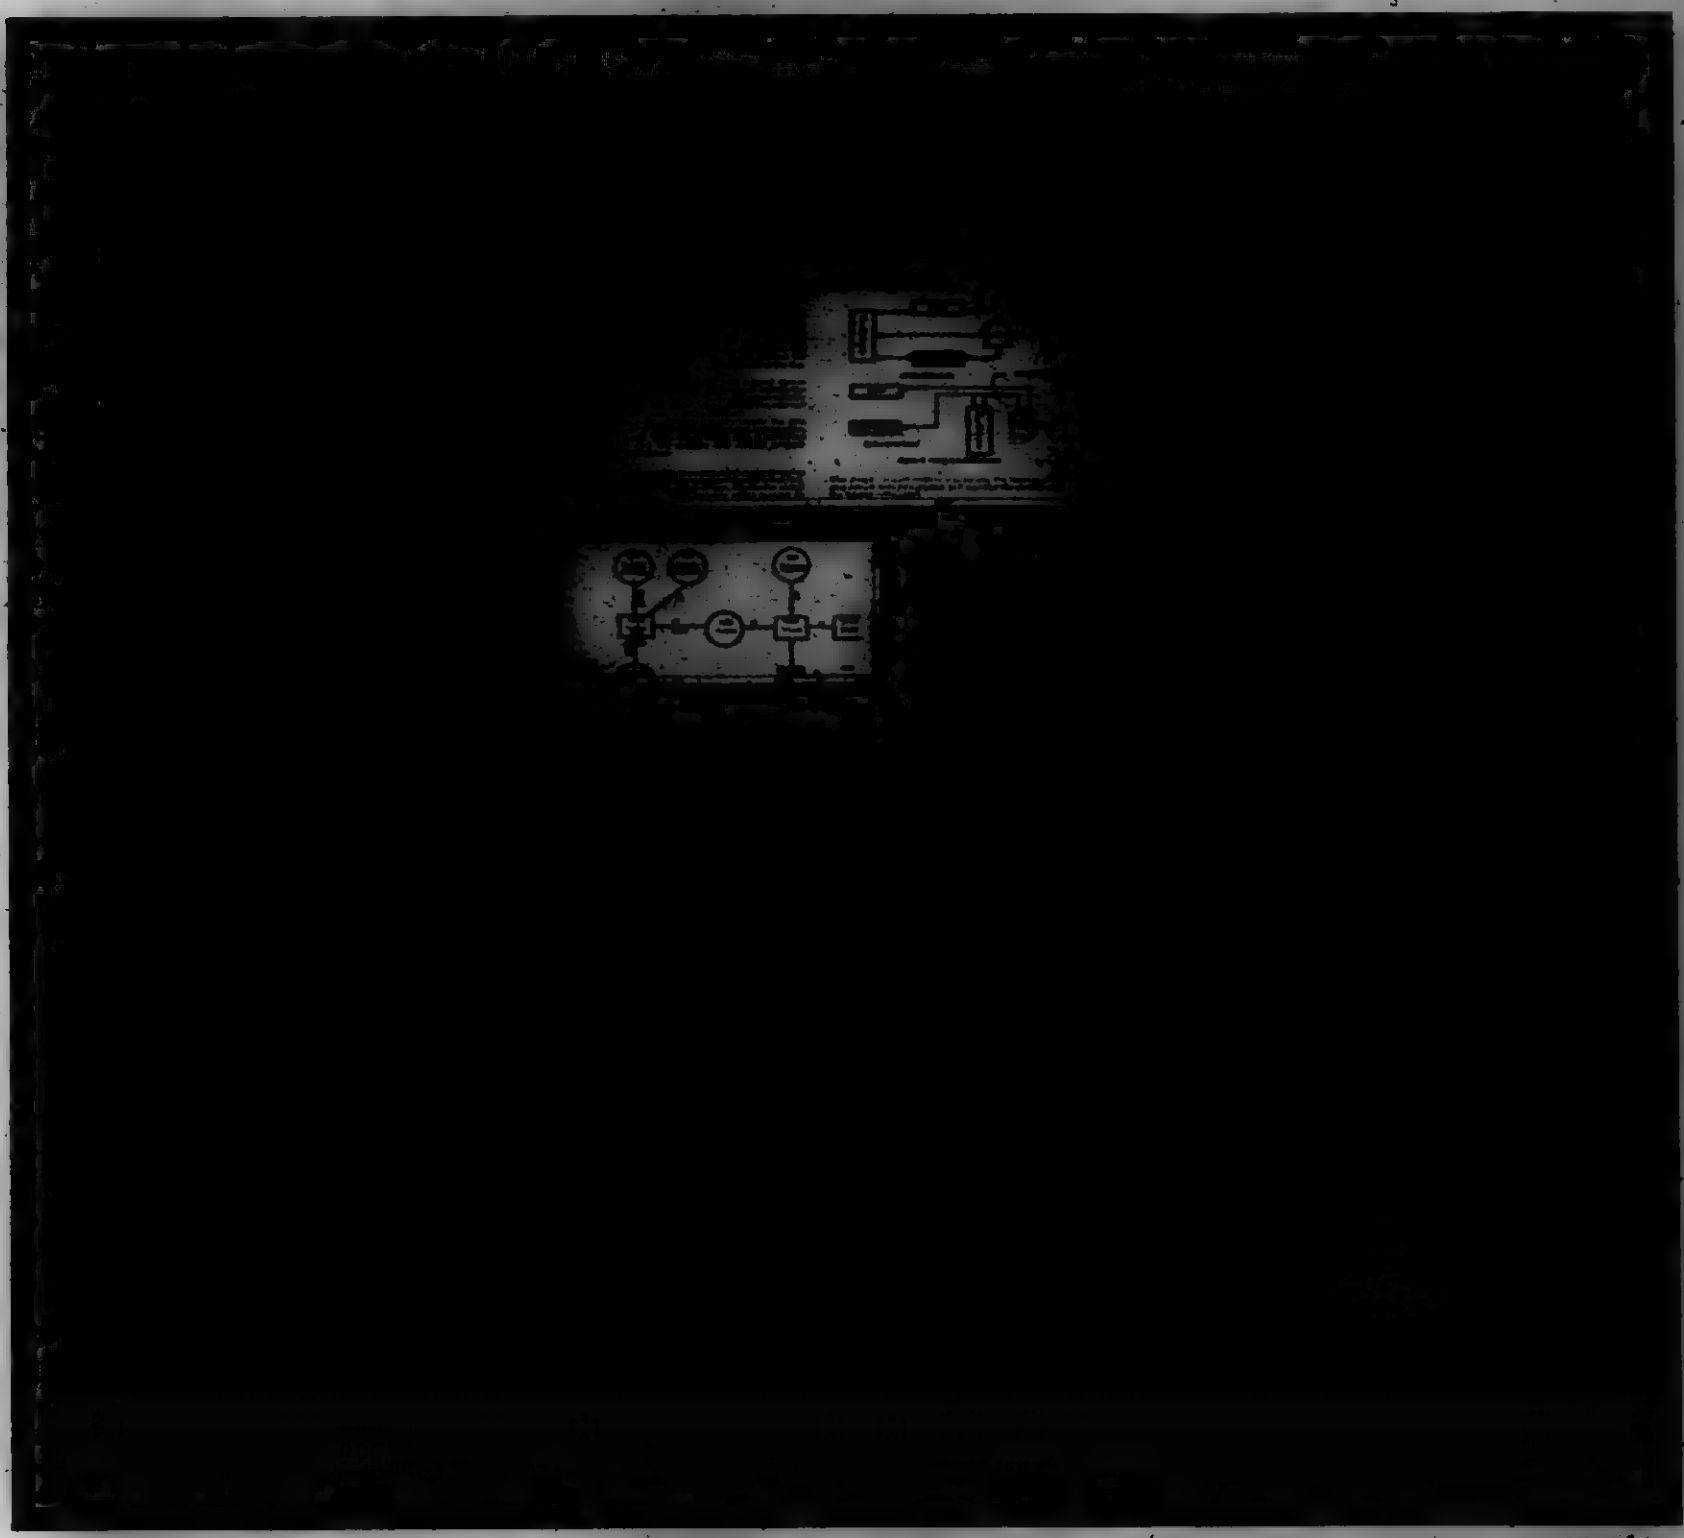
Smartmodem Specifications:
Low Speed Data Formats (Smartmodem 1200 and Smartmodem 300) Serial, binary, asynchronous: 7 or 8 data bits; 1 or 2 stop bits; odd, even or no parity (0-300 bps).
High Speed Data Formats (Smartmodem 1200) Serial, binary, asynchronous: 7 data bits, 1 or 2 stop bits; odd, even, or fixed parity or 8 data bits, 1 or 2 stop bits; no parity (1200 bps).
Dialing Capability: Touch-Tone® and rotary-dial pulse dialing.
Command Buffer: 40 characters.
Commands (unnecessary with Smartcom II software): A: Immediate answer. A/: Repeat last command. C: Transmitter Carrier. D: Dial command, including simple dialing, waiting for second dial tone, auto-dialing and other features. E: Local echo. F: Full/half duplex. H: Switch hook. M: Audio monitor. O: On-Line. P: Pulse dialing. Q: Quiet mode. R: Reverse originate/answer mode. S: If "Set" commands speed, escape code character, number of rings to answer on, etc. S?: Checks operational parameters above. T: Touch-Tone dialing. V: Verbal result codes.
Result Codes (can be numerical/verbal): 0/OK: Command line ok. 1/Connect: Carrier detected. 2/Ring: Phone is ringing. 3/No Carrier: Carrier lost or never heard. 4/Error: Error in command line. 5/Connect 1200: Carrier detected at 1200 bps. (Smartmodem 1200 only.)
Audio Monitor: Two-inch speaker with volume control.
Rear Panel: On-off switch, power jack, RS-232C connector, modular phone jack connector, volume control.
Operation: Full or half duplex.
Data Rates: 0-300 bps and 1200 bps for Smartmodem 1200; 0-300 bps for Smartmodem 300.
Interface: RS-232C.
Intelligence: Z8™ microprocessor with 4K byte control program for Smartmodem 1200; Z8 microprocessor with 2K byte control program for Smartmodem 300.
Modem Capability: Bell System 103 or 212A compatible originate or answer mode for Smartmodem 1200; Bell System 103 compatible originate or answer mode for Smartmodem 300.
Receive Sensitivity: -9dBm for Smartmodem 1200; -6dBm for Smartmodem 300.
Transmit Levels: -10dBm.
Registration: FCC registered for direct connect to the nationwide phone system. Connects with modular jacks RJ11W, RJ12C, RJ21W, RJ22C, RJ31W, RJ32C.
Power Pack: U.L. listed 120VAC, 60Hz, 13.5VAC output.
Size: 2.5" × 5.5" × 9.0"

The genius of Team Xerox.

XEROX



The 8010 professional workstation has always been known as a computer of dazzling capabilities, especially in its graphics, information processing and document preparation.

Team Xerox

But what some people may not know is that the 8010 is also the key element in Team Xerox, a system of office machines designed to work together like a team.

When part of an Ethernet network, the 8010 can work with a wide array of word processors, mainframes, personal and business computers, printers, electronic mail and file services, facsimile terminals, communicating Memorywriters, other networks and, of course, other 8010's. It also provides 3270 and TTY emulation.

Its full 17" bit-mapped screen lets you view two full pages simultaneously and open up to six documents at a time without covering up a previous document.

It's also the only workstation that can create and print documents in more than a dozen languages, including Russian and, for the first time, Japanese (Katakana, Hiragana and Kanji).

While other workstations may use Xerox innovations like the mouse, icons, windows, property sheets and combined text and graphics, the 8010 simply does more with them.

For example, the 8010's extensive software is fully integrated, to allow you to work with text and graphics simultaneously. You can draw a flowchart right in the middle of a full page of text without having to resort to a separate program and limited buffer "scratchpad" or "clipboard."

In terms of capabilities, ease of use and overall value, the 8010 would have to be considered the stellar workstation in the industry.

For more information, call 800-527-1922 (in Texas, 800-442-0152), or send in the coupon. Or ask anyone who's ever used the 8010.

Xerox Corp., Box 470065, Dallas, Texas 75247.

SOFTWARE & SERVICES

Continued from page 68

graphics and statistics capabilities and a link to the HP image data base manager.

The graphics module reportedly allows translation of data in a model to a histogram, vertical and horizontal bar charts, pie and star charts and X-Y and bubble plots. The statistical module was designed for basic statistics and test of significance and correlation. The enhanced version is available starting at $25,000.

EPS, One Industrial Drive, Windham, N.H. 03087.

DATA BASE MANAGEMENT SERVICES

SYSTEMS PROGRAMMING LTD.
Adaprep enhancement

Systems Programming Ltd. has announced an enhanced version of Adaprep, a data-dictionary-driven data management language for users of Cobol and PL/1 systems based on Software AG of North America, Inc.'s Adabas data base management system.

The enhancement uses Software AG's Predict data dictionary and integrates it by using the file and field attributes to generate executable code, according to a spokesman for the vendor.

Adaprep is said to cut programming effort by eliminating the need for Direct Call programming or Adamint procedures, as well as automatically integrating and activating the data dictionary, the spokesman for the vendor said.

The product updates the data dictionary with field and file information to produce reports on data base usage by field and program, the spokesman said.

Adaprep is licensed at $17,000 for IBM DOS systems and $21,000 for IBM OS systems, both VS1 and MVS. Maintenance fees are equal to 15% of the license fee, according to the vendor spokesman.

Systems Programming, Suite 220, 131 Stewart St., San Francisco, Calif. 94105.

REMOTE COMPUTING SERVICES

MARTIN MARIETTA DATA SYSTEMS, INC.
Subscription Service

Martin Marietta Data Systems, Inc. has announced the Subscription Service, which the vendor said offers users fixed-price time-sharing on its IBM processors in IBM VM and MVS environments.

A Subscription Service user purchases a block of computer resources at a fixed price rather than paying on a usage basis, a vendor spokesman said.

In addition to the IBM operating systems, users of the Subscription Service have access to a variety of productivity tools and application systems.

Prices for the Subscription Service begin at $15,000/mo, according to the spokesman for the vendor.

Martin Marietta Data Systems, 6303 Ivy Lane, Greenbelt, Md. 20770.

ON-LINE DATA BASES

EUROPEAN LAW CENTRE LTD.; WEST PUBLISHING CO.
Eurolex, Westlaw access

European Law Centre Ltd. and West Publishing Co. have announced a joint agreement to provide mutual access for their subscribers to legal information data bases offered by the companies.

European Law Centre's Eurolex data base is now accessible through West Publishing's Westlaw computer-assisted legal research service, and the Westlaw service is available to Eurolex subscribers.

West Publishing, P.O. Box 43526, 50 W. Kellogg Blvd., St. Paul, Minn. 55164.

SCIENCE/SCOPE

In a step toward faster and more powerful integrated circuits, a Hughes Aircraft Company research team has made submicrometer transistors using focused ion beam lithography. The group made N-channel silicon MOSFETs with self-aligned submicrometer polysilicon gates. The smallest dimension of the gates ranged from 0.35 to 1.2 micrometers. The focused ion beam was used to expose a highly sensitive resist, which provided a mask for reactive ion etching the polysilicon by a combination of chlorine and fluorine-based etch gases. Outstanding electrical performance was obtained for the N-channel FETs, which employed a 100-angstrom-thick gate oxide.

A laser is used to weld certain components of the AMRAAM missile to lower costs and to provide improved performance where low heat distortion is required. The missile's precision RF (radio frequency) seeker antenna is made lightweight and low in cost by laser-welding aluminum foils together. The missile fins are made of laser-welded corrugations and skins to provide strong lightweight surfaces for steering the missile in flight. Hughes designed and developed the Advanced Medium-Range Air-to-Air Missile for the U.S. Air Force and Navy. This laser welding process was developed by Hughes on an Air Force manufacturing technology program. AMRAAM is manufactured in Tucson, Arizona.

The new Telstar 3 communications satellite is providing TV, radio, voice, and high-speed data transmission services within all 50 states, Puerto Rico, and the U.S. Virgin Islands. Telstar 3 is the first in a series of three that Hughes is building for American Telephone and Telegraph Co. The cylindrical satellite measures 7 feet in diameter and stretches more than 22 feet high with its antenna erected and outer solar panel deployed. It operates from a geostationary orbit 22,300 miles above the equator, roughly on line with Houston. The second and third satellites will be launched in 1984 and 1985 aboard the space shuttle.

In a step toward large flat-panel television screens, research scientists at Hughes have developed new mixtures of liquid crystals. A test panel made with the new liquid crystals proved far superior to the kind of displays used in digital watches and calculators. It could be seen clearly at extreme angles without loss of gray scale. The test panel used a mixture of black dye and liquid crystals in a twisted nematic configuration. The transmission-type cells were used with just one polarizer and with diffuse backlighting. The study is part of a program to develop high-performance, flat-panel military displays.

Hughes needs engineers, scientists, and programmers to design and build advanced airborne and spaceborne radar systems, including data links, electronic warfare systems, and display systems. We need systems analysts (communications and control theory, signal processing, applied mathematics), microwave specialists (antenna, receivers, transmitters, data processors), circuit designers (analog, digital, RF/IF), scientific programmers, mechanical designers, systems and test engineers. Send resume to Engineering Employment, Dept. S3, Hughes Radar Systems Group, P.O. Box 92426, Los Angeles, CA 90009. Equal opportunity employer.

CONTINENTAL RESOURCES.

One company. All the answers.

Whether you're adding high-tech products to your company for the first time or upgrading an existing system, you have a choice: You can deal with multiple vendors, conflicting claims, long lead times and poor service, or you can call Continental Resources.

Whether you're looking for a personal computer, dumb terminal, disk drive, high-speed line printer, data communications equipment, or an advanced graphics system, Continental has the answer. Products of almost every description from virtually every industry leader:

- Anderson Jacobson
- CDC
- Computer Devices
- CIE Terminals
- Digital Equipment
- Diablo
- Data Products
- General Data Comm (or GDC)
- Genicom (G.E.)
- IBM
- Lear Siegler
- Micom
- NEC
- Northern Telecom
- Texas Instruments
- Teletype
- Ventel
- Visual Technology

But Continental doesn't just offer great selection. We provide a total support package unmatched in the industry. Special interface problems? Our Sub-Systems group is expert at solving even the trickiest problems. Complex data communications needs? Our Datacomm group will help you find the best solution. Not sure of what you need? Our specialists will evaluate your needs and recommend the right system for you. **And that means software, too. And supplies like ribbons, printwheels, and paper — even complete work stations.**

In short, you're guaranteed the most informative, professional assistance available — before and after your purchase. And Continental even provides complete on-site service.

Our national network of offices provides sales, technical and service support backed by more than 20 years of experience.

Even if you're not ready to buy, Continental offers a host of rental or leasing options — one is sure to meet your needs. So call us the next time you need high-tech products or services. Continental Resources is the one company with all the answers. **We deliver what you need.**

Spartacus — the spirit of distributed processing

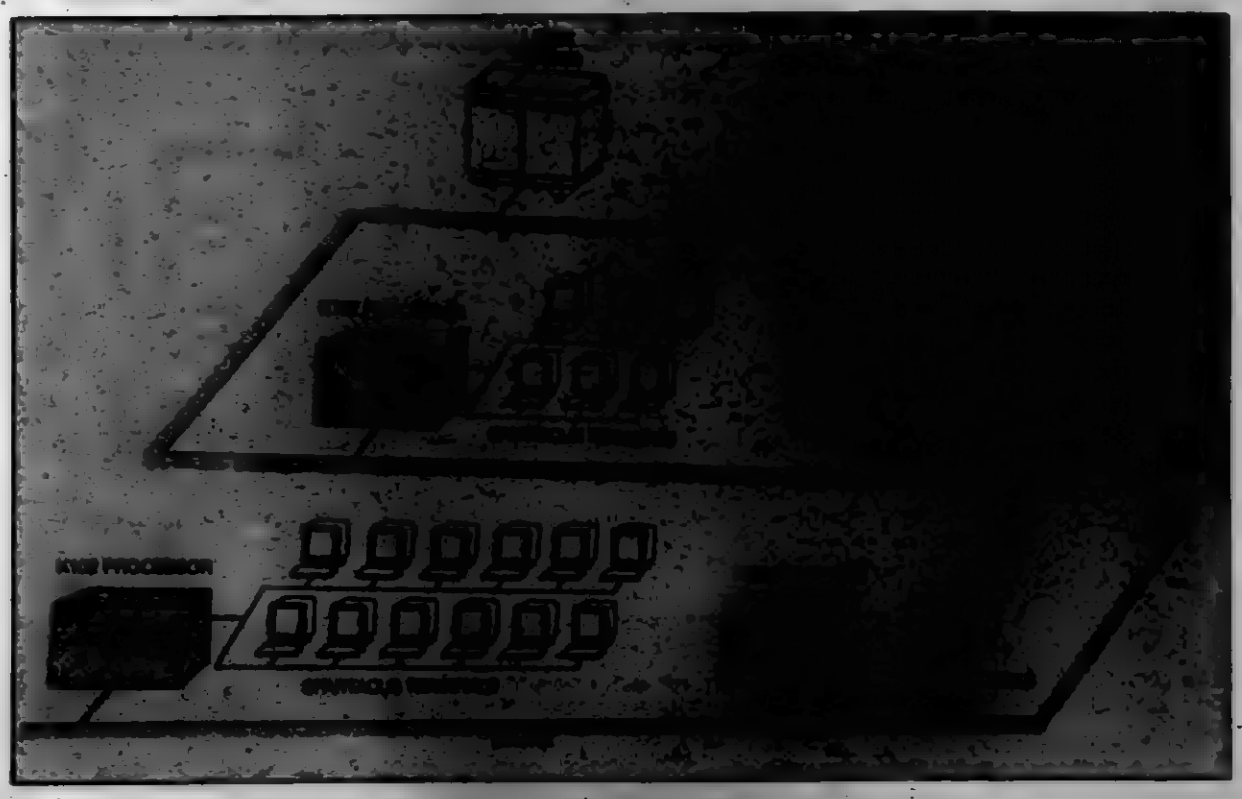
In Spartacus' world of distributed processing, the processor is installed and processing in minutes, the operation requires no skilled operator, the CPU plugs into a standard wall outlet, the "data center" can sit amidst the people who use it and the cost per user falls between $10,000 and $20,000, sometimes less. If that kind of system sounds like a challenge to centralized computing, well, that's what it was designed to be.

George McQuilken — the 41-year-old founder, body and soul of Spartacus Computers, Inc. in Bedford, Mass. — is targeting the mainframe shops that have a heavy investment in IBM systems and software. He conceived the Spartacus System for the office as a distributed processing alternative fully compatible with the IBM 370. The workstation-based system features an Ethernet local-area network control unit.

"We're in rebellion against centralized data processing," McQuilken says. Actually, it is the commitment of so many DP departments to IBM mainframes that gives Spartacus its market opportunity. McQuilken is pitching his system to "the person who wants to preserve the IBM investment but wants to control his or her own destiny."

George Harrar, senior editor of features, interviewed McQuilken in December, a few days after the two-year-old company shipped its first system and hired a new president and chief operating officer. That man is Carl Jansen, the star of Burroughs Corp. television commercials and president of its Business Machines Group. McQuilken, who guided Spartacus' first years in five capacities, by his own choice has cut back to three — chairman of the board, chief executive officer and treasurer.

CW Photo by George Harrar



IN DEPTH

An interview

George McQuilken

You recently installed your first system at Symbolics, Inc. in Cambridge. Was this installation on schedule?

To the day. Unlike most companies, we're pretty conservative. It must be the IBM training. We've run machines here since December of '82. Symbolics was our first real shipment of a manufactured machine, but we have another machine installed at our beta test site, and that ran for three months — the whole test — without failing.

One thing really proving to be important is plant site integration. I can explain that best by contrasting it: Most large computer manufacturers really do the integration of their hardware and software at the customer site. For example, if you buy a computer from IBM, the processor might come from Endicott, the disk might come from San Jose, the tapes might come from Tucson, the terminals might come from Kingston; the software is distributed from Hawthorne, N.Y. This equipment has never run together. Consequently, installing a computer and shooting bugs and so forth can sometimes take several days.

Our machine leaves here with the peripherals integrated. They're all tested with the system, and the operating system and networking software are installed here, too. It's tested here as a complete system. Therefore, it isn't really surprising to us that a machine works when we get it to a customer. It would be more surprising if it didn't.

Your installation at Symbolics took 30 minutes —

Twenty-nine.

Under 30 minutes. That establishes a mark hard for you or any other vendor to match. Were you aiming for that time?

We were aiming for not needing a skilled specialist at the remote site. These are distributed processors. So assume that we sold them to a large insurance company in Boston. They aren't buying them just to use in Boston. They're going to put them all over the U.S. By a trained staff, we mean one to two field engineers and at least one software specialist provided by the customer at a remote site. So the time isn't the thing, it's the fact that we didn't invest three to 10 man-days of effort. Neither we nor the customer put in that type of effort to make the machine go.

How many people from Spartacus were at the site?

Oh, this was our first installation, so there were a few people, but I think only one guy was doing any work. We do believe in the idea that when you send a machine, you do

want to send a man or a woman along to install it. But it's one person, and his skill level needs to be more like a customer support person than an engineer or systems programmer. I'm trying to think how long it takes to set up a personal computer — it's in exactly the same range.

Ours comes in a big crate rather than a cardboard carton, so you have to take your wrench and unbolt the crate, and you have to connect a few cables. That's what takes the 30 minutes. But there is nothing magic about 30 minutes. It doesn't matter if it is 30 minutes or an hour, it's that it can be set up immediately upon receipt and will be running that day.

How involved were you in designing the K102?

The whole preliminary design was done by me. All the major features and capabilities were done by me.

When you set out to develop the system, what features were indispensable in your vision of it?

Operator-less operation — that was the key thing, because if you look at the trends and the economics of computing, it's clear to all of us that hardware is declining rapidly in cost. That's the reason why personal computers and distributed processors are so popular. This has been going on for years. But the cost of supporting the machine — the personnel — is a big factor. When I was still at IBM, they had the largest private network in the world. They have something like 600 processors on five continents and in 90 cities, and you say, "Why aren't there more nodes and more networks like this one." One of the major reasons is that in each and every one of those places, you have a computer room.

Now a computer room, even a small one, can easily cost you a quarter of a million dollars to put in your building. That's a raised floor, extra power and cabling, extra air conditioning. And then almost every system has an operator, trained and skilled. So when you look at the annual operation cost of the computer, what are you going to attack? Well, you can attack the cost of the computer, but you attack these other costs, too.

One of the reasons our machine installs so rapidly is that it runs in a standard office environment off a standard wall outlet. So you see there's little preinstallation work that has to be done. The major thing I wanted to do was build a computer that was IBM-compatible but ran in the office and didn't need a skilled operator. I like the term "midframe." It's 32 bits, and by that I mean it's 32 bits in the processor, in the registers, through the internal buses — none of this fiddling . . . it's a full 32-bit processor. It's fast through the buses, it's fast through the I/O structure. It's much more like a mainframe.

Did you have a target price in mind that you had to come in under?

When I was first starting, I was concerned with cost per user as much as cost per system. It's clear you need a cost per user of under $20,000. I don't know why that's a target. We knew we probably had to target the market under $100,000. There's plenty of room in the $100,000 to $200,000 market also.

One of the reasons our machine installs so rapidly is that it runs in a standard office environment off a standard wall outlet. So you see there's little preinstallation work that has to be done. The major thing I wanted to do was build a computer that was IBM-compatible but ran in the office and didn't need a skilled operator. I like the term "midframe."

Then we looked at features and disk storage. We talked a great deal with possible customers. I had very good contacts in that field, plus I had experience with IBM working and designing distributed processors. Right now the machine can easily come in under $10,000 a user, but again, it depends on the features and processing power. People who are used to using a mainframe use a lot of disk storage in computing. They're not people who can do their work on a personal computer. But we're easily under $20,000 for each user and in most cases we are under $10,000.

With $20,000 per user as an upper limit in your mind, what did you have to leave out of the K102?

You couldn't have made it a single-user workstation, not and maintain the complete IBM compatibility. So there was no choice but to include some of the characteristics of a mainframe and some of a workstation. We focused on the idea that we would appeal to a department of a large company that has a number of users, anywhere from three to 10 people. We felt a department isn't big enough to need 75 users. Then you have a large, time-sharing mainframe.

What kind of system would this department buy from you?

The system is an integrated pack-

RED HOT OFFER.
GET THE NEW ENVISION 215 COLOR GRAPHICS TERMINAL AND GET COLOR ALPHANUMERICS FREE.

You're in for a nice surprise. Because when you buy our new Envision 215 Color Text/Graphics terminal you'll also get color alphanumerics. Free.

WHAT YOU DON'T KNOW

What you might not know is that our new 215 is a low priced terminal with two distinct and very usable talents.

It's an intelligent color graphics terminal which also happens to be a high quality color alphanumerics terminal. But this didn't happen by chance.

We designed both capabilities into the same terminal for one very important reason. You. And quite frankly it makes a great deal of sense because now you don't have to buy two terminals when you want to create color graphics and color alphanumerics. Our new 215 does both exceedingly well.

DID WE GIVE OUR 215 TOO MUCH GRAPHICS CAPABILITY?

Before answering, you should know our 215 is the ideal color graphics terminal for an amazingly large number of applications.

In business, scientific and engineering our new 215 tackles complex color graphics with aplomb.

There's actually a good chance you'll run out of ways to use our 215 in your particular job long before it runs out of color graphics capability.

That's because it's supported by ISSCO, Megatek, Precision Visuals and SAS Institute graphics software.

We also made it compatible with the Tektronix® 4014 which means our 215 is supported by a host of other graphics software packages.

SHARP. PUNCHY. VIVID. COLOR GRAPHICS

You don't have to be an art major to create striking graphics with our 215. You can create vivid 8-color graphics from a palette of 64 colors.

The vivid part comes from the fact that our 215 has a high resolution 640 x 409 display.

It also supports vector drawing in a 16K x 16K virtual address space. All of which means the graphics you create are sharp. Punchy. And vivid.

When you need color graphics in a hurry, our 215 provides complex polygon drawing, vector drawing and fill primitives as standards. And screen copies are easy because our 215 is compatible with our Envision 430 Color VectorPrinter.™

And there's more!

VT-100 is a registered trademark of Digital Equipment Corporation.

age, so when we talk about a system, it has the disk built in and the terminals, of course, attached to it, and it has the operating system software built in. The only things lacking are the user programs and data. Now since we're assuming that this person has a commitment to IBM mainframes, he already has programs and data. They're in the corporate data center on the mainframe. What we have is a networking program to attach to that. That's one of the things we think is a real value-added — we're protecting the investment in programs and data.

IBM software — there's no problem running . . .

No problem. Most IBM software will run with no modification, change or anything on our machine.

You say "most." What would fall in the category of not running?

Things that give you trouble are going from one release to another of IBM software. But I don't like to use the word "most," I like to say "all." But if you look at IBM's recent product announcements, like the XT 370, you notice they say, "This runs most software." IBM has a diversified product line, and it's hard for me to say "all." If IBM won't say that all your software will run on their machines, then I don't think it's fair to ask me to. As much will run on ours as will run on theirs . . . model to model and release to release. For example, the IBM compilers will run on our machine. Some of the decision support software you see around — we've tested things like [Information Builders, Inc.'s] Focus, [Management Decision Systems, Inc.'s] Express and [SAS Institute, Inc.'s] SAS, and that all runs on our machines.

You were targeting a very particular niche in the market.

The broad-scale niche is distributed processing, but the thing we decided is that systems would be easier if the different nodes in the network were compatible. This sounds obvious, but it wasn't obvious when IBM designed the 8100. It isn't obvious to a number of people that in some cases people would get a large IBM mainframe and put a number of DEC [Digital Equipment Corp.] systems or Data General [Corp.] systems around as remote processors. But in most cases, they have run into programming and compatibility problems with these things. So we were trying to build the distributed processor and remove the compatibility problem. That was the niche.

Or to put it another way, there are many people who currently use large mainframes in big organizations and for one reason or another are dissatisfied. They're dissatisfied either because the data center is far away and they can't get their output or the data center distributes charges to them that they think are unreasonable. These people would like to buy a minicomputer, and they may have looked at machines from other people. But the fact is that to do that, they would have to rewrite their programs and they don't want to make that investment. So again, the real niche is the person who wants to preserve the IBM investment but wants to control his or her own destiny. So really, a lot of the people who buy personal computers have some of the characteristics we like.

How about the IBM 4361? That came out after you started Spartacus. Was it a surprise?

No, not at all. There really is nothing new or novel about that processor. It's basically a faster model of the 4331, when you look at it. So they've improved the price/performance in their processors. It would be great for us and for every other competitor of IBM if they never improved their capabilities. But we can't expect that. The 4361 still really is designed to work in a computer room, to have an operator, to have a full complement of disks and peripherals around. I don't know what the average cost of one of those configurations is, but I know the average price of a 4331.

A survey done by International Data Corp. said the average price was $370,000 — that's a complete system, not CPU. So I imagine a 4361 typical configuration comes in at something like $400,000. You can see why I feel that we don't compete directly with a $400,000 machine that needs a computer room and a trained staff.

But if offshoots of the 4361 lead the same way as you are, then they become prime competitors.

That's correct. We do have some features that IBM doesn't have in their machines. I think we're a real technological leader in this business of unattended operation, automatic system start-ups and in terms of built-in diagnostics. But given some lead time and the fact that they might push to learn from our innovative efforts, they could do that.

The one thing we do that they are not likely to do is interface directly to [Xerox Corp.'s] Ethernet. Essential to a distributed processing strategy is good local-area networking. There is a lot of local-area networking, but it varies very much in quality, consistency, types of devices you can attach to it. We know pretty well that IBM will have its own local-area network. We anticipate that they have little motivation to connect to Ethernet and make it easy to attach devices from hundreds of other manufacturers to their machines. We don't have that motivation, so I think our Ethernet strategy alone gives us a market niche which no one

Five different line types are available for vector drawing. Two character fonts are provided. And both fonts can be drawn at four different angles in 16 different sizes.

If all of that's still not enough, don't forget our 215 is also a very versatile color alphanumerics terminal.

INDEPENDENT COLOR ALPHANUMERICS MAKE OUR NEW 215 DOUBLY VALUABLE

We gave our 215 independent memories for graphics and alphanumerics so you can display them separately. Or together.

We also made it VT-100® compatible with programmable soft keys and menu configuration.

You can make characters double width and double height and display 132 column information for maximum viewing.

You can also mix foreground and background colors to highlight different types of data.

A ONE YEAR WARRANTY ON ALL OUR COLOR TERMINALS

When you buy our new 215 we won't forget you. Matter of fact, you'll probably want to know more about our entire family of color graphics terminals. For example, our advanced 230 terminal gives you a local display list for interactive design applications.

Every terminal we make comes with a full one year warranty.

And because they're fully compatible, you can upgrade from one Envision terminal to another as your needs grow. Speaking of needs, you're going to like the human engineering aspects of our terminals almost as much as the capability they give you.

Our 215 for instance is small and ergonomically designed with a detached compact keyboard plus full tilt and swivel convenience. And cursor control can be mouse-driven for optimum operator convenience.

ONE RED HOT OFFER YOU SHOULDN'T PASS UP

We think you'll be impressed with our 215. But don't just take our word for it. Pick up your telephone and call us about a free demo. Or send us the coupon. You'll not only see that our new Envision 215 is a great color graphics terminal. It's also a great color alphanumerics terminal. Best of all, the alphanumerics are yours. Free.

So show a little sporting interest and take us up on our offer. You'll get a red hot demo and a chance to buy two color terminals-in-one. At a price that makes our competitors green with envy. Send us the coupon or call. Envision, 631 River Oaks Parkway, San Jose, CA 95134, (408) 946-9755 or Telex: 176437.

else is in right now.

What other strategies do you have or products will you be coming out with, perhaps to counter IBM in one or two years?

I have some pretty good ideas, but I don't want to tell everybody. There's two things I see us as doing probably better than IBM. On the lower end, our virtual machine implementation I believe is superior to theirs. Using the concept of a virtual machine and combining local-area networking with virtual machine concepts are a real value. IBM has pretty much changed its mainframe strategy to its SNA [Systems Network Architecture] strategy to its XA [Extended Architecture] strategy. All those strategies are going to make it hard for them to have a consistent, compatible low-end line of processors. My evidence for that is that they don't have that today. They have at least three lines of processors in the 370 area — they've got the PC XT-370, 4361-class processors with a version of VM and then the XA class processors, without a full VM implementation on them today.

They have three different classes of incompatible machines and slightly different operating systems out there today. So it's hard to see exactly how they are going to do everything we do and be compatible up and down their own product line, which is probably more of a problem for them than we are.

Why did you leave IBM?

To do this — entirely opportunity. I had done a number of relatively successful projects at IBM, and I felt that there were certain barriers there. I like to work on innovative projects that advance the practice of computing. I saw the chance to do that outside as better than inside. I'm not the only one, if you look at all the high-tech start-ups along Rt. 128 here and look at the number of people who felt it was in their best interest to leave DEC or Prime [Computer, Inc.] or Data General and start companies. It's clear I wasn't the only one in the industry feeling this sense of frustration. But it was nothing to do with IBM. IBM is a great company.

Did the opportunity come to you, or did you develop the idea?

I developed the idea myself. I had been working at IBM as editor of the *IBM Systems Journal* and had worked a little bit with the 8100 and SNA people. I then went to IBM's Scientific Center in Cambridge, Mass., and designed the principal distributed processing features that are in the 4300 line today. So I knew I could do this. My project there was ending up. It had been put in the IBM product line — the product division had taken it over. It was time for me to crank up a new project.

So after a great deal of deliberation, I thought if it was time to start cranking up a new project, it was a good time to leave. I didn't want to leave in the middle of a project, and I sure as heck didn't want to design something while I was at IBM and leave and build it, because that would really be unethical. So basically I left with no capital, no job, no anything. In fact, the management there, I think, thought it was rather strange. They had never had anyone resign to take no job before. I was candid. I told them I was going to leave and start a computer company. I don't think they believed me. They may believe me now.

How did you arrange capital?

Over the years, I had paid a lot of attention to things like the MIT Enterprise Forum. I went out and got myself a couple of strong business advisers who were prepared to give me assistance. Their first insistence was that I write a business plan. In a big company, I would have started designing a processor. But, really, I spent the first five or six months out of IBM writing and revising a business plan, recruiting the basic team of people and talking to potential investors. And that was one of the most stressful six months of my life, because my money was running out.

The venture capital community likes a repeater — they like people who have started companies before and who are known to them. I was coming out of IBM; I was unknown to them. So I had to find a couple of investors who weren't professional venture capitalists to put up the first round of seed money, and then I was able to do some pilot studies and licensing of our software to raise some other money. So we were relatively late. We were in business and had machines running before we did our first round of professional venture capital financing. That's actually been good because the early employees and I have maintained much more control of this company than at similar companies, from what I hear.

You have edited the IBM Systems Journal, taught at Boston University and Northeastern University, done design and research at the IBM Scientific Center. Did the venture capitalists look at that background and say, "Well, where is your managerial experience?"

They most certainly did.

How did you answer?

I had never run a big operation, so that was something that was a source of concern to the venture capital community. But from my viewpoint, I knew a fair amount. I reported very high in the IBM organization. My third level manager would have been the president, John Opel. I was certainly one of the youngest manag-

"dBASE II helps keep us on our toes."

Robert Hubert
Marketing Director
The Boston Ballet

"The Boston Ballet was a company in search of a computer when I joined the organization earlier this year. And, after discovering that a large computer system was being considered, I urged a smaller, more sensible first step.

"Since almost no one at The Boston Ballet had any previous computer experience, I strongly recommended the purchase of a microcomputer and dBASE II.

"dBASE II, the relational database management system from Ashton-Tate, would give the people in the Company the time and the opportunity to get used to computing before bringing in a larger, more expensive system later on.

"dBASE II is a command-driven, highly flexible system that can be used for a great variety of applications ranging from very simple to highly complex."

A premier performer from Day One.

"dBASE II manages our extensive season subscriber mailings; keeps track of all our advertising insertions, costs and efficiency; and makes project time management a snap. We are now making plans to use dBASE II in handling the special promotions and manpower analyses critical to our day-to-day management.

"dBASE II made an immediate and sizeable impact on the efficiency of our operation."

The real kicker.

"Recently, we hired a custom systems house to develop a long-range computer program for The Boston Ballet. Without prejudice, they came back and said the new system should be based on dBASE II."

dBASE II can provide you with virtuoso performance, regardless of your application.

For more about dBASE II, contact Ashton-Tate today. 10150 West Jefferson Boulevard, Culver City, CA 90230. (800) 437-4329, ext. 217. In Colorado (303) 799-4900. In the U.K. (0908) 568866.

ASHTON·TATE

dBASE II is a registered trademark of Ashton-Tate.
Suggested retail price for dBASE II is $700.

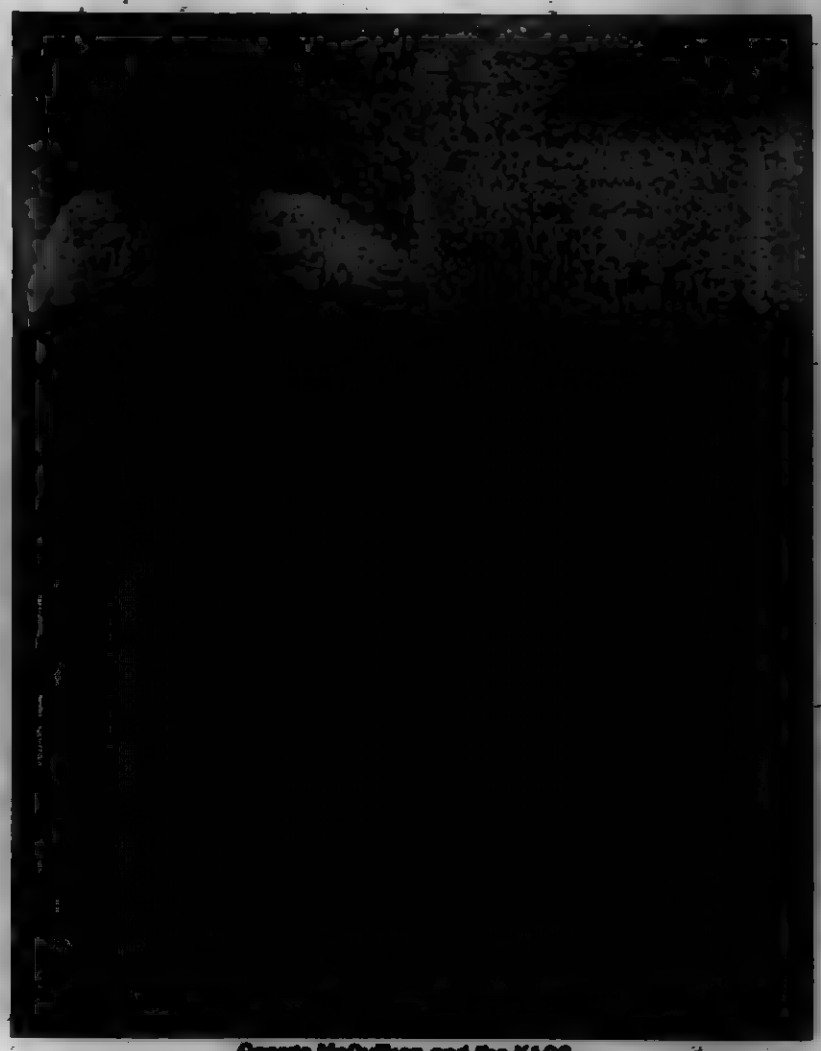
IN DEPTH/SPARTACUS



George McQuilkin and the K102

ces at IBM corporate headquarters.

The initial advice the venture capital community gave me was that I should go out and find an experienced executive as a partner, and then the two of us should start a company and they would fund it. I heard this from a number of venture capital firms, so I went on an executive search, and I must have talked with everyone I could find around the Rt. 128 area who had been a high-level executive at one of the other companies.

The problem is that when you have nothing but an idea, you don't have credibility with the venture capitalists and you don't have credibility with other executives either. The type of person who has run a big operation is a little more conservative and isn't impressed by a guy who's working out of his house. To some extent it was fortunate, because I had the pleasure of two years of running the company myself as chairman of the board, chief executive, president, chief operating officer and treasurer. But I'm tired of being all those things. Now we're able to have Carl Jansen join us. Carl has run a $160 million operation at Nixdorf, and he was president of Burroughs Business Machines Group. I think their revenues must be in the $3 billion range. So you see I got a much stronger executive than I could have gotten a year ago.

What will the addition of Carl free you to do?

It has a lot to do with the direction of the company, both the technical direction and the business strategy. In a small company, this is all tied together and there isn't much time to think about the future. It's clear to me that we can't be a one-product company. In fact, we aren't a one-product company. We have a couple of different product lines now. We need to broaden our product line. We have to be prepared for the fact that IBM does introduce new products from time to time, and so I can do all that as well as deal with the financial community.

In order to become a worldwide manufacturing company, we're going to have to raise a substantial amount of money. I also intend to keep the research direction of the company directly under my control. I have no great desire to control a large development organization, I'm concerned about the direction of the company, the direction of research and our external relationships with the technical and academic communities and the business and financial communities.

The other thing is, it was the right time. There's no reason people should think I can run a company with one to 5,000 employees, because I never have. Carl has run bigger operations than that. So I think we have extremely complementary skills.

On a personal level, I will say that I'm coming off close to three years of working 80- to 100-hour weeks, and I'm tired. A good friend of mine called me up. He knew Carl was coming on, and he said, "How does it feel

For $1750 plug into the IBM 3270 with low-cost printers.

InterLynx™/3287 protocol converter features:

- Fully compatible with IBM 3274/3276 controllers.
- Use low-cost ASCII dot matrix and letter quality printers on 3270 controllers.
- 3270 Type A coax-to-async ASCII conversions.
- LU 3 (BSC) and LU1 (SCS SNA/SDLC) modes.
- Full operator panel (including reprint).
- Front panel menu setup.
- RS-232C and Centronics interface standard.
- Pseudo-transparent data feature.

Find out why over 2,000 companies worldwide use Local Data protocol converters to expand their IBM mainframe communication capabilities.

Call today for more information. And ask about our 30-day free trial program.

Products require IBM/COMPATIBLE or UNIVAC 80/90 MAINFRAME

to be retired?" That's a little extreme because what we're going to do is make the company grow and expand the work load too.

How many employees do you have?

On the payroll, there are 77. Some of those are co-op students and part-timers.

Are you using your connections at Boston University?

We seem to get a lot of people from there. Carl Jansen went there, and he also went to MIT. I'm an MIT grad; they are one of our investors. One of the problems with starting a company is that you have to do everything fast. We were slower at rounding up capital than some of the other companies, but consequently, we got a better deal — we got more capital for less of the company than the other prestige start-ups around here. I was slower to recruit the executive talent, but now I've got probably one of the finest executives we could find to join the company. He knows the IBM world — he was there for 14 or 15 years. He managed their whole sales operation in this region at one time. So you see, we seem to be doing things six months to a year later than conventional wisdom says, but when we do it, it seems to work a little better.

That's measured growth rather than . . .

Oh, we'd like to grow explosively. As an example, the fact that we put a beta test machine out there and it ran for three months without failing, that's very impressive to people. But it didn't surprise me because we didn't ship it until we had machines running for nine months. I hear there are some companies that announce machines that they haven't developed and tested.

You've heard that?

I wouldn't know anything about this myself, of course. Even IBM announced this PC XT-370 and wouldn't even tell you what day they were going to ship it on. They say first customer ship is second quarter, 1984. Because they are IBM, people have confidence in them. But I just mean it's quite common in this industry for people to announce machines they don't have. We've announced machines we do have. We can show them to anybody.

Where would you like to be in terms of size and products in five years?

We're tracking against the real high-growth companies on Rt. 128. You can look at some of the new companies that have gotten off to a successful start, like Stratus Computer, Inc., Apollo Computer, Inc. and Automatix, Inc. It's hard to say we'll do better, but we want to track with the really high-growth companies on 128.

However, there is one thing we want to do a little differently than some of them. A few have been one-product companies that have had meteoric growth and then declined. That's what we don't want to do. We want to have a series of innovative products. I can't tell you specifically what we are going to do, but it will all be in the area of distributed processing and networking. We want to be one of the high-growth companies, but we still want to be around in 10 years. We have a lot of responsibility to our employees, to the widows and orphans who own our stock, to the community at large. I can't think of any decision we've made on a short-term basis.

What kind of pressure do the venture capitalists put on you to show short-term growth, and how involved are they in the direction of the company?

They seem to be more concerned with their companies who aren't making their plans than with companies who are. I find they're great with helpful advice. Very early on, they came in and went over all our budgets, department by department, project to project and never cut a thing. From what I'm hearing now, if anything, they feel our plans are too conservative, that we can really take this company somewhere. At the risk of sounding too rebellious — if I had wanted to have people tell me what to do, I would have stayed at IBM because they had some people who were very effective at doing that. I don't like that very much. But I like to think I take advice very, very well. That's how you build confidence with people.

How much venture capital did you raise?

We've raised over $5 million in capital. The formal fund raising this spring was for $3 million. We've been very frugal. The reason we were frugal is that we didn't have enough money to spend. Carl and I were trained at IBM, so . . .

That brings up the question about a conservative philosophy running a start-up company. Does conservative fiscal philosophy work in a high-growth, start-up atmosphere?

That's a good question; because I've heard people say that a typical California start-up grows twice as fast as an East Coast start-up. So it is true that maybe we are more conservative than we should be. But this is New England.

Did it surprise you that Symbolics is your first user? It doesn't seem to be a typical customer.

HARD FACTS ON SOFTWARE

Israel, a world center for innovative software.

Israel's unique position has created an atmosphere where innovative software development has flourished.

A Meeting of Minds

Join over 3,000 participants from more than 40 countries who will be meeting in Jerusalem from **May 21-25, 1984, at the 4th Jerusalem Conference on Information Technology.**

The conference, together with the concurrent exhibition, will deal with one of the hottest issues of the coming decade: computer technology, applications and software.

The conference will provide a unique forum for experts from all over the world to meet, exchange information and explore new ideas and trends.

A special feature of the conference will be **Executive Track.** This program is oriented towards senior executives and registration is limited.
Participants will include high level executives in both industry and government, from all over the world. Speakers and session moderators are internationally renown leaders in their respective fields
While in Israel you may also choose to attend **Isratech '84,** Israel's showcase of high technology.

On Line to Your Needs

Israel's software houses have specialized in all areas of commercial applications from educational to business; industrial to military and financial to personal.

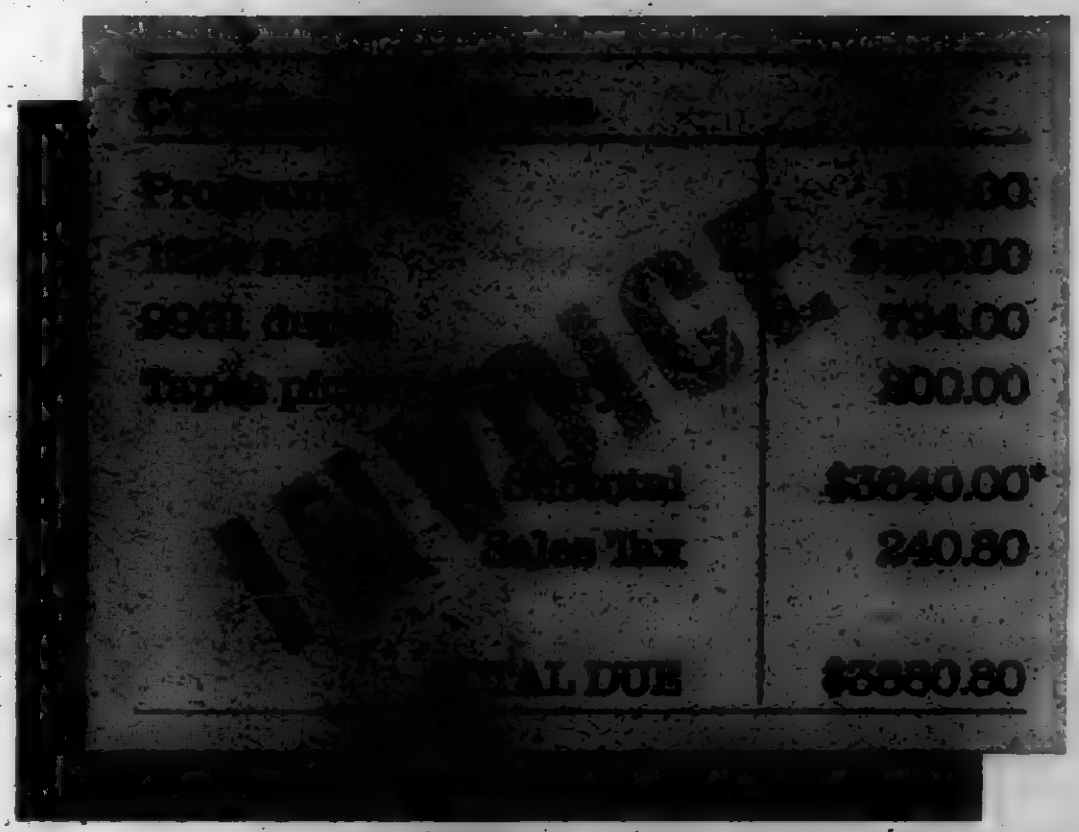
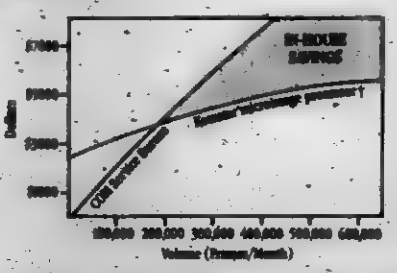
Don't pay this bill.



Run your own in-house COM for less with a Kodak Komstar microimage processor.

The decision is long overdue. Especially if your monthly computer output is close to a quarter-million pages.



That's when a Kodak Komstar microimage processor not only pays great dividends in faster, easier turnaround but can pay for itself in two years or less.

The chart here shows the break-even point based on the above service bureau bill.

But what it doesn't show are all the applications you're probably putting on paper: Internal SYSOUT. Security reports. Or time-sensitive data.

So instead of spending lots of money on a COM Service Bureau, spend it on your own Kodak Komstar 100, 200, or 300 microimage processor.

Send in the coupon today. Or call toll-free 1-800-44KODAK (1-800-445-6325), Ext. 300. And take the smart way out of next month's bills.

Kodak

*Average values based on estimates from available data. †All hardware costs and maintenance contracts are included. © Eastman Kodak Company, 1989

Please have one of your representatives contact me with more information on a Kodak Komstar microimage processor.

We knew right from the start that Ethernet was a big part of our strategy, so I guess that it wouldn't be surprising that a company that's dedicated to Ethernet wants one of our machines. In fact, we aren't prepared to announce it, but I can say we're running with a couple of million dollars' backlog of some of our products now, and they are all from people who are interested in our Ethernet capability. I might have thought that one of the big IBM-mainframe commercial users around would have been our first ship, but then again, that's [the kind of company] where our beta test machine is running.

Did you realize that Ethernet would be the salient feature in many purchasing decisions?

I felt that it was substantial differentiation. The question is not just the Ethernet, however. If you look around, there are hundreds of companies that have Ethernet now. It's the particular implementation we have that's superior. If anything surprises me, it's that Ethernet isn't more widely adopted than it is today.

What deals can you tell me about right now, including the connection to Nixdorf?

The Nixdorf relationship has been a big boost for us. By working with Nixdorf, we've been able to adopt some of their technologies and components, which has really helped us keep the price of the processor down. In return, we'll be licensing some software to them, which they may or may not choose to introduce into the marketplace. But if they do, that would give us a combined market share.

To a certain extent, it's a pretty complicated relationship, because Nixdorf is a supplier of ours, they are a customer of ours and, of course, to a certain extent, a competitor. That's not that strange a relationship. If you look at Trilogy, for example, it has cooperative deals with Sperry, DEC, Honeywell Bull and so forth. We feel it's probably better to do this than to try to go it alone as a tiny company. But there is nothing restrictive in our agreements with Nixdorf. The principal suppliers are Nixdorf for boards, Visual Technology for displays, Key Tronics for keyboards . . . We must have 50 vendors involved in this.

How is this state for launching a business?

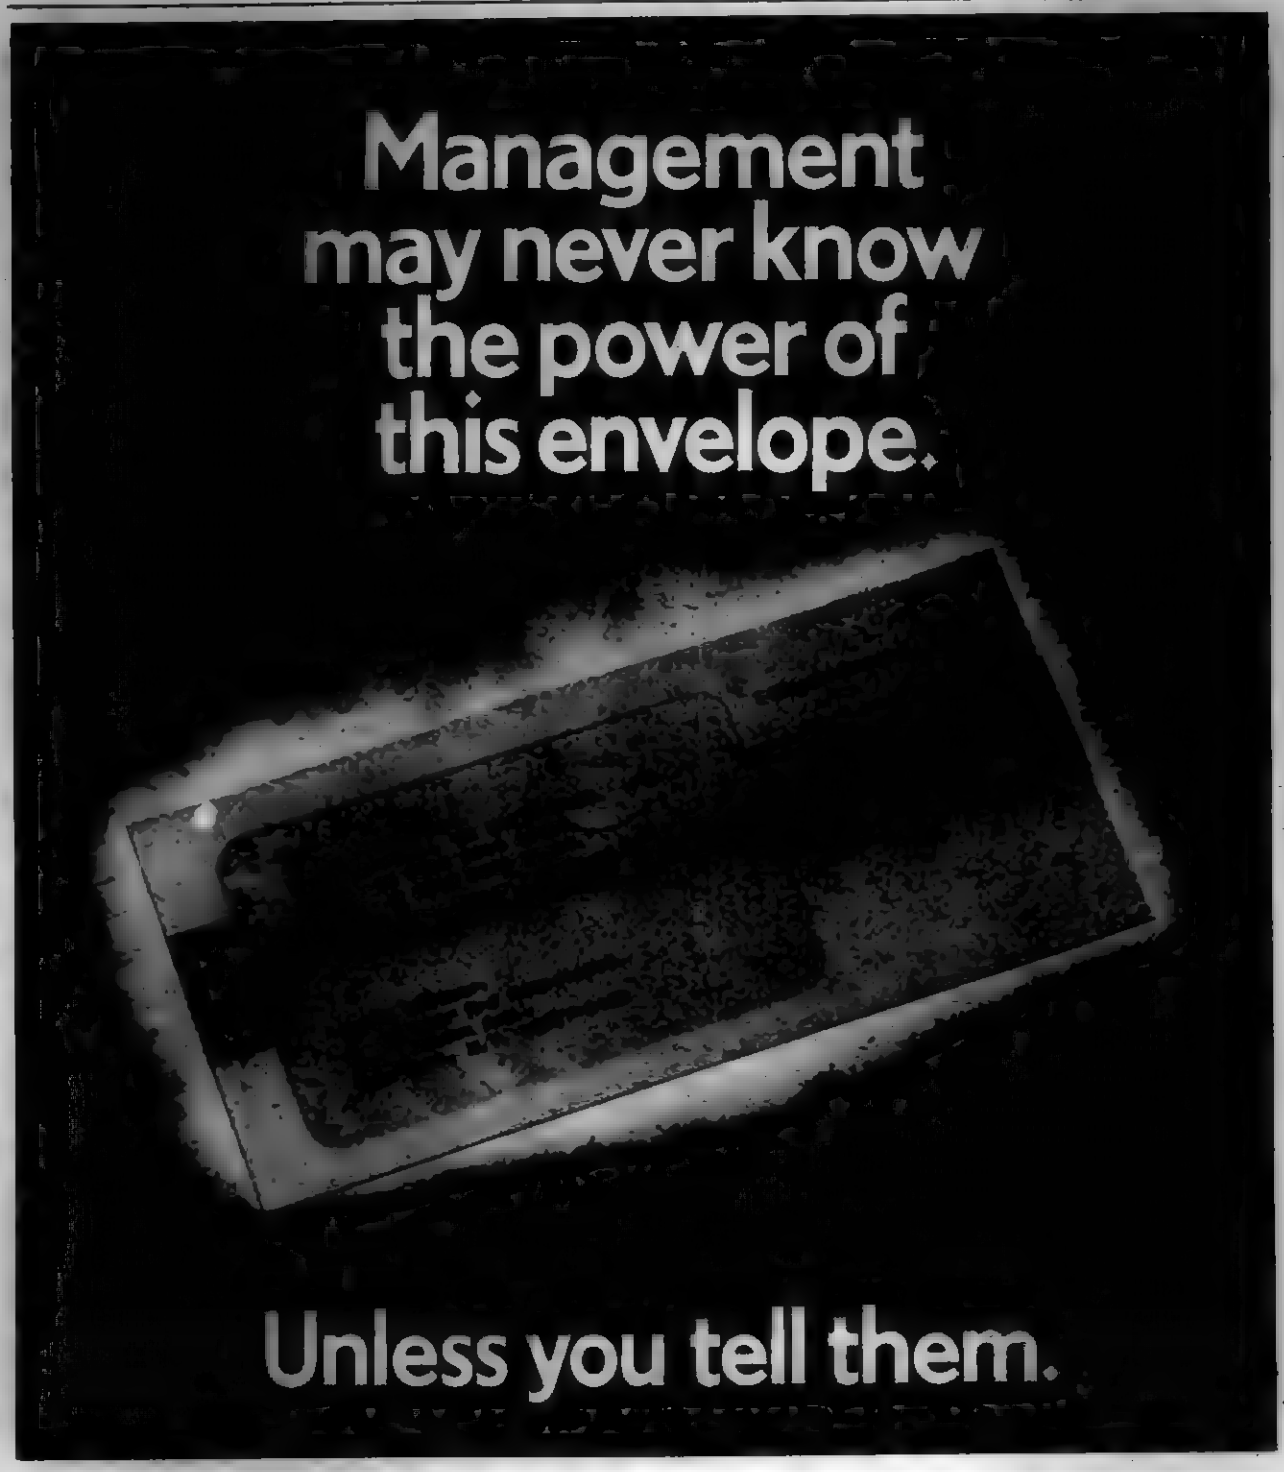
Massachusetts is a great place to start a computer company; that's why so many people do. There is the support infrastructure — the combination of legal, accounting and banking to help start a new company. You have real estate developers who are willing to talk to you. It's pretty risky just for someone to lease us this building. When you are a very early start-up, anyone who does business with you might as well be a venture capitalist. It's just some of the venture capitalists don't get any stock, but they're sure taking a risk.

You also have a highly trained and skilled work force here. Our recruiting has been excellent. We hired IBM's designated area VM specialist. We hired one of the key networking product planners at Wang. There are people around who fabricate computer parts, who make printed circuit boards, who sell cables and connectors and pins.

About everything you need to start and run and operate a computer company exists right here. That's not to say that it doesn't exist other places. I've heard that there's a place in California that has a lot of start-up companies, too. Those are clearly the two areas of the country where you have everything you need to start a company.

This building is getting tight for you in terms of space. Any plans to move or build or lease elsewhere?

We don't want to move too fast. As a start-up company, you never build, because that isn't the most effective use of your capital. At the very best, you lease. What you have to do is find an existing building, because you can't wait. We are already looking for space. This place is full and we don't have enough manufacturing capability, so we're literally borrowing space from people. We're assembling things



You don't have to tell management how easy it is to implement E-COM® service. That can be your secret. Tell them instead about the power of an E-COM service mailing. How letters can be sent right from the company computer. How the Postal Service prints, folds, inserts, seals and delivers these letters for you. How the distinctive blue envelopes of E-COM service lend visibility and impact to your mailing.

Since you're the one who gets E-COM service up and running, you have three options—all of them easy. First, you can write the system interface yourself. It takes about a day, and Postal Service consultants are standing by to give you any help you need. Second, you can buy a dedicated interface from a third-party vendor. Third, you can access E-COM service through an independent communications carrier, without bringing the system in-house at all.

As part of the D.P. department, you're in a unique position to tell your management about the power of E-COM service. So find out more. Call your local Postmaster. You may never again get so much credit for so little work.

E·COM

in other places. We really need a big building, but we aren't prepared to pay for it.

How many systems are you building right now?

Twenty.

They are ordered?

No, unfortunately. Let's put it this way — to handle the anticipated demand, we have one or two still available to qualified purchasers. We're always looking for a few good customers. We can clearly make more machines than we can sell for the time being, unless we come in with a very large contract, which we surely would like to. People don't give large contracts to small companies. Even if they're eventually going to buy 10 of your processors, they take one now. That's the commitment they'll make.

What's a target number to sell in 1984?

I can't really tell you that.

What companies do you want to sell to?

Just get a list of the Fortune 500 or the Fortune 1000. That's obviously the customer base we'd like; the problem is, it's very hard to get in there. There aren't that many computer vendors successfully doing business with them.

What types of companies within that group are most likely to buy from you?

One is the office business functions where they do what you generally classify as decision support. People want to manipulate their own data. The other is probably CAD/CAM (computer-aided design and manufacturing), which is an explosive market for everybody. Those seem to be the two areas that large companies are involved in where the demand for the right product seems almost inexhaustible. How many could be sold? If this was an IBM product, they'd probably sell 25,000 in the next week.

Are you saying that number facetiously?

No, I really believe they'd sell 25,000. They sold 10,000 4331s. They must have sold 25,000 System/34s, or more. But we're a start-up company. We worry about selling 25.

Could this product have been developed at IBM?

It would have taken two years longer. Basically this whole processor was designed and constructed . . . remember, I started by hiring some of my students. So we really started informally. Well, everyone started that way, without an office. I hired my first employee in June 1981; then we started the paperwork to incorporate. The company was officially incorporated in October 1981. We announced a product in October 1983, and then it was a hair longer to first ship. At IBM, the cycle was more like four or five years.

Did you think about suggesting this idea at IBM?

Well, I had left IBM before I had this completely thought out. Suggesting to IBM is kind of a funny thing. I

We were jokingly calling the company Spartacus for the reason that he led the most successful revolt against the centralized Roman empire, and we thought of distributed processing as being a rebellion against centralized computing and centralized mainframes.

mean, there are 360,000 people at IBM. I did approach my management suggesting we attach Ethernet to the 4331s. They were clearly not interested in doing that. They weren't interested then, they don't appear interested now. When I left, it sparked a great deal of interest at IBM about local-area networks, because I was fairly well-known in some areas.

But when I was there, there was no support for a few of the things that we've incorporated into this processor. IBM makes mass-market products, so every product is a compromise. We look at this product and say, "We've got a good product, and we want to sell it." Within IBM, we'd get this far and then someone would say, "I'm not sure if we want to sell it because it would hurt our chances to sell System/34s." There are always competing projects at IBM. You could have a very successful project and not have it come out as a product. That's what takes the extra two years at IBM — the product planning.

The other thing is that if IBM announces it's a product, they'd probably sell 25,000 of them, meaning they'd have to make them. That's a large-scale organizational effort. They also have to train 10,000 sales people.

The problems they have, on the whole, are good problems.

Realistically, they can't act as fast as a small company. On the other side, for a big company, they act pretty fast.

Everything a VAX user could ask for in a storage subsystem.

The Emulex package deal.

Software transparency, low prices, rental/purchase option plans, a trade-in program and a service security blanket. Included are pretested drives and controllers; direct factory installations; fulltime hardware/software applications assistance; and nationwide service through Control Data, General Electric and Tymshare.

Emulex innovation—introducing our Eagle disk/Keystone tape combination.

Where else can you get a unit that optimizes the Fujitsu Eagle's 1.8 MB/sec transfer rate and provides backup, archiving, journaling, and the media interchangeability of ½-inch tape? All in one 42-inch cabinet. Best yet, the FXD-51 is available in six DEC-emulating models for PDP and VAX users on the CMI, SBI or Unibus.

The world's best drives and controllers.

Emulex subsystems let you be very picky. You select proven tape drives and disk drives from 80 to 675 MBytes. Plus you can mix and match fixed and removable disk drives of varying sizes and configurations. At the heart of the subsystem is an Emulex controller designed specifically for your particular DEC CPU.

Emulex has been and continues to be the pioneer in DEC-compatible subsystems. And in each product our objective is clear: to make your DEC system faster, more efficient and capable of processing larger, more complex programs more reliably than any other alternative.

Find out more about the total Emulex package. Phone toll free: (800) 854-7112. In California: (714) 662-5600. Or write: Emulex Corporation, 3545 Harbor Blvd., Costa Mesa, CA 92626.

EMULEX

The genuine alternative.

GET EVERYBODY ON BOARD.

Now there's a way to let everyone in your company chip in.

AT&T Information Systems, the company whose unparalleled communications heritage has been bringing people together for 100 years, now brings your office together. With state-of-the-art office automation that's designed to get your company moving ahead.

Electronic Document Communications, now available on System 85 and DIMENSION® PBX, is an easy-to-learn software application that's hard to beat. Because it integrates your office by letting everyone prepare, send and store documents and messages with the speed and efficiency of a computer. So you can have better access to the right information in the right form at the right time.

Electronic Document Communications can streamline your office in three ways:

Preparing Information—Reduces the time, effort, cost and wasted paper between drafts by electronically creating, editing and formatting documents and messages. "The Composer," a special software feature, checks spelling, grammar, punctuation and usage. EDC even measures whether documents are readable by technical and nontechnical readers.

Moving Information—Speeds documents to many people in different locations simultaneously so they can act decisively. EDC allows you to determine the timing and cost of delivery, and even check to find out when documents were received. Using a password ensures the privacy of your messages.

Managing and Storing Information—Locates documents, and retrieves and evalu-

ates contents quickly and easily with electronic files—while reducing the possibility of losing documents. An electronic "Mailbox" allows you to quickly determine which documents to read first. EDC reduces storing and filing costs with an electronic "Archives" that allows for either short- or long-term storage, and the "Wastebasket" which enables you to permanently delete items after a determined period of time. There's even an electronic "Calendar" that checks personal schedules and arranges mutually convenient meetings.

Not only will all these features help you further integrate your office, Electronic Document Communications is itself just one part of AT&T's line of completely integrated business systems. For state-of-the-art office automation, you can implement EDC in conjunction with other applications software like Message Center/Directory, a call coverage and message system. These office management applications are now available on System 85 and DIMENSION® 600 and 2000 systems with the Applications Processor.

The result is you'll be able to improve staff productivity at every level and get everybody on board. And as new features are developed in the future, they'll be compatible with your existing equipment.

EDC was developed by Bell Labs systems designers who now work for AT&T Information Systems Laboratories. AT&T Western Electric produces EDC, and AT&T Information Systems will maintain it with comprehensive, conscientious service from the largest service organization in the industry. To find out more, call toll-free 1-800-247-1212, Ext. 879M.

AT&T's Electronic Document Communications: It's part of the integrated office of tomorrow that you can board today.

AT&T Information Systems

Did you pick the name Spartacus?

Yes. It almost came out of a joke. When you have a group of volunteers and you're trying to start a company, if you don't watch it, you find you're spending all your time discussing two things: where the company is going to be — and everyone wants it close to their house — and what the name is. This gets silly, because you don't have any capital, and you don't know if you'll ever get started, and you're discussing these things.

We were jokingly calling it Spartacus for the reason that he led the most successful revolt against the centralized Roman empire, and we thought of distributed processing as being a rebellion against centralized computing and centralized mainframes. So all of a sudden, I started saying, "OK, from now on, it's Spartacus," and it has been Spartacus ever since. If there's anything unfortunate about it, it's that I don't want to give people the idea that we're somehow battling IBM. Our products are really complementary to IBM's. The fact that IBM has a successful product line and people like the company and make major commitments to it is what gives us our business opportunity. So we're in rebellion against centralized data processing — not that we think we're going to destroy it.

For 16 years you worked at IBM, which is known as the safe choice for DP managers making purchasing decisions. Now you are working for a company in which you have to convince people that it, too, is a safe choice.

It's a substantial obstacle. I've only had two jobs in my career, IBM and here. But Carl has been selling against IBM very effectively for quite a while.

How do you go about marketing the company now and developing an image?

Well, it's not an image, it's really an identity. We like to think there's a certain amount of substance behind it. I'm not sure advertising is the right vehicle for us. We know how to identify our customers — they have large buildings — and our staff has been extremely active in users groups and national societies, so we have a strong image in that community.

One thing we have tried to do is to convey as part of our identity a theme of excellence or of attempting to deal with first-class people. People, quite candidly, have been asking me what am I doing with a guy like Carl Jantzen in here, why do we need somebody like that. The answer is that he's a world-class executive and the type of person I want to work with in everything we do. The problem is, to do that we can only do a few things, but the things we do we really want to do well.

You talked about distributed processing vs. centralized. Where is distributed processing heading, and how is Spartacus going to be a part of it?

There's a huge pent-up demand for distributed processing, departmental processing. What it really comes down to is local control. You're seeing the same thing in computing now that you saw 10 or 15 years ago with terminals. People got tired of their keypunches; they wanted terminals. Today they want computers. We can argue cost, cost-effectiveness, technology or anything else. But the main reason distributed processing is a good market is that people want their own computers.

The one thing I never anticipated is the wide acceptance of the personal computer. That's the one thing that changed in the external environment. I didn't know it was going to happen, you didn't know it, IBM didn't know it. If we have a big challenge for the future, it's that we [make sure we] have the right product concept and that we're in the right marketplace. We have to find a long-term niche for ourselves; standing between the mainframe and the vast proliferation of personal computers and other office equipment. The good news is that it's an explosive market; the bad news is it's a tumultuous market and nobody knows exactly what products will be successful.

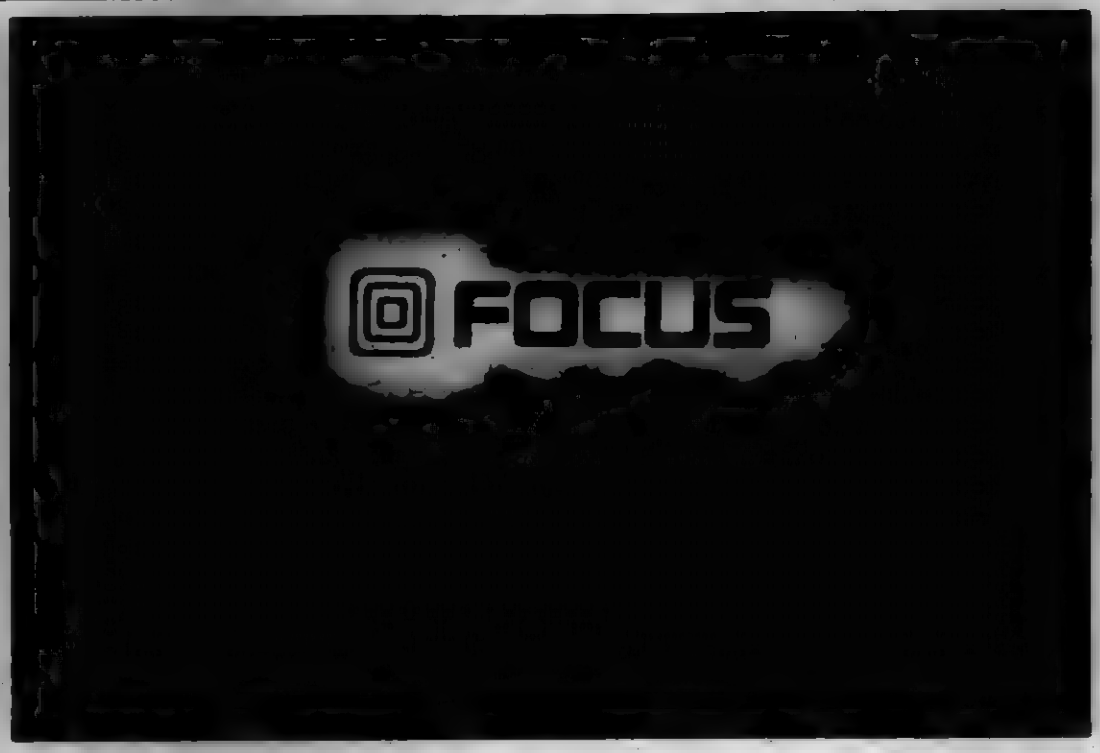
You need to tie in to a personal computer down the line?

Well, we already do. We can connect personal computers to our machine. It's not just connecting them, it's coexistence in that environment. It's clear that personal computers are going to replace terminals. It's clear that local networks are going to come into all of these places. What's not clear is who is going to make the terminal, who's going to make the network, who's going to install them and what people are going to use them for, because they're using these devices for applications we never anticipated.

What exactly is your competition?

IBM, IBM, IBM. We compete with the IBM 4300, the IBM System/38, the IBM Personal Computer, the IBM System/36 and so forth. But the major competitor is conceptual, not really a product. A certain number of people remain committed to centralized data processing. If someone is emotionally and philosophically committed to centralized data processing, then we can't sell them a distributed processor. But if people need IBM-compatible distributed processors, we have a great business.

ONE LANGUAGE. ONE SOLUTION.



THE KEY TO INFORMATION CENTER PRODUCTIVITY.

In today's Information Center environment the #1 application development tool is Information Builders' FOCUS. No other product offers the productivity and full range of functions provided by FOCUS...all within one nonprocedural language!

FOCUS' powerful relational facilities enable you to quickly build new systems. You can create new files within minutes using simple English commands, as well as query and report from existing files (VSAM, QSAM, IMS, IDMS, etc.) in your Information Center.

This increases programmer productivity by hundreds of percent, and allows end users to perform their own ad hoc queries, reports, financial modeling, graphics and statistical analysis after only a few hours familiarization.

And, there's PC/FOCUS too. It expands your PC into an Information Center with the same relational database, screen manager and data analysis facilities found in mainframe FOCUS. Plus, it enables you to download, manipulate and/or upload data extracted from mainframe files and DB's, all with full FOCUS security.

The FOCUS system. The language that unlocks productivity in your Information Center. For details write to: Don Wszolek, Dept. MS, Information Builders, Inc., 1250 Broadway, New York, NY 10001.

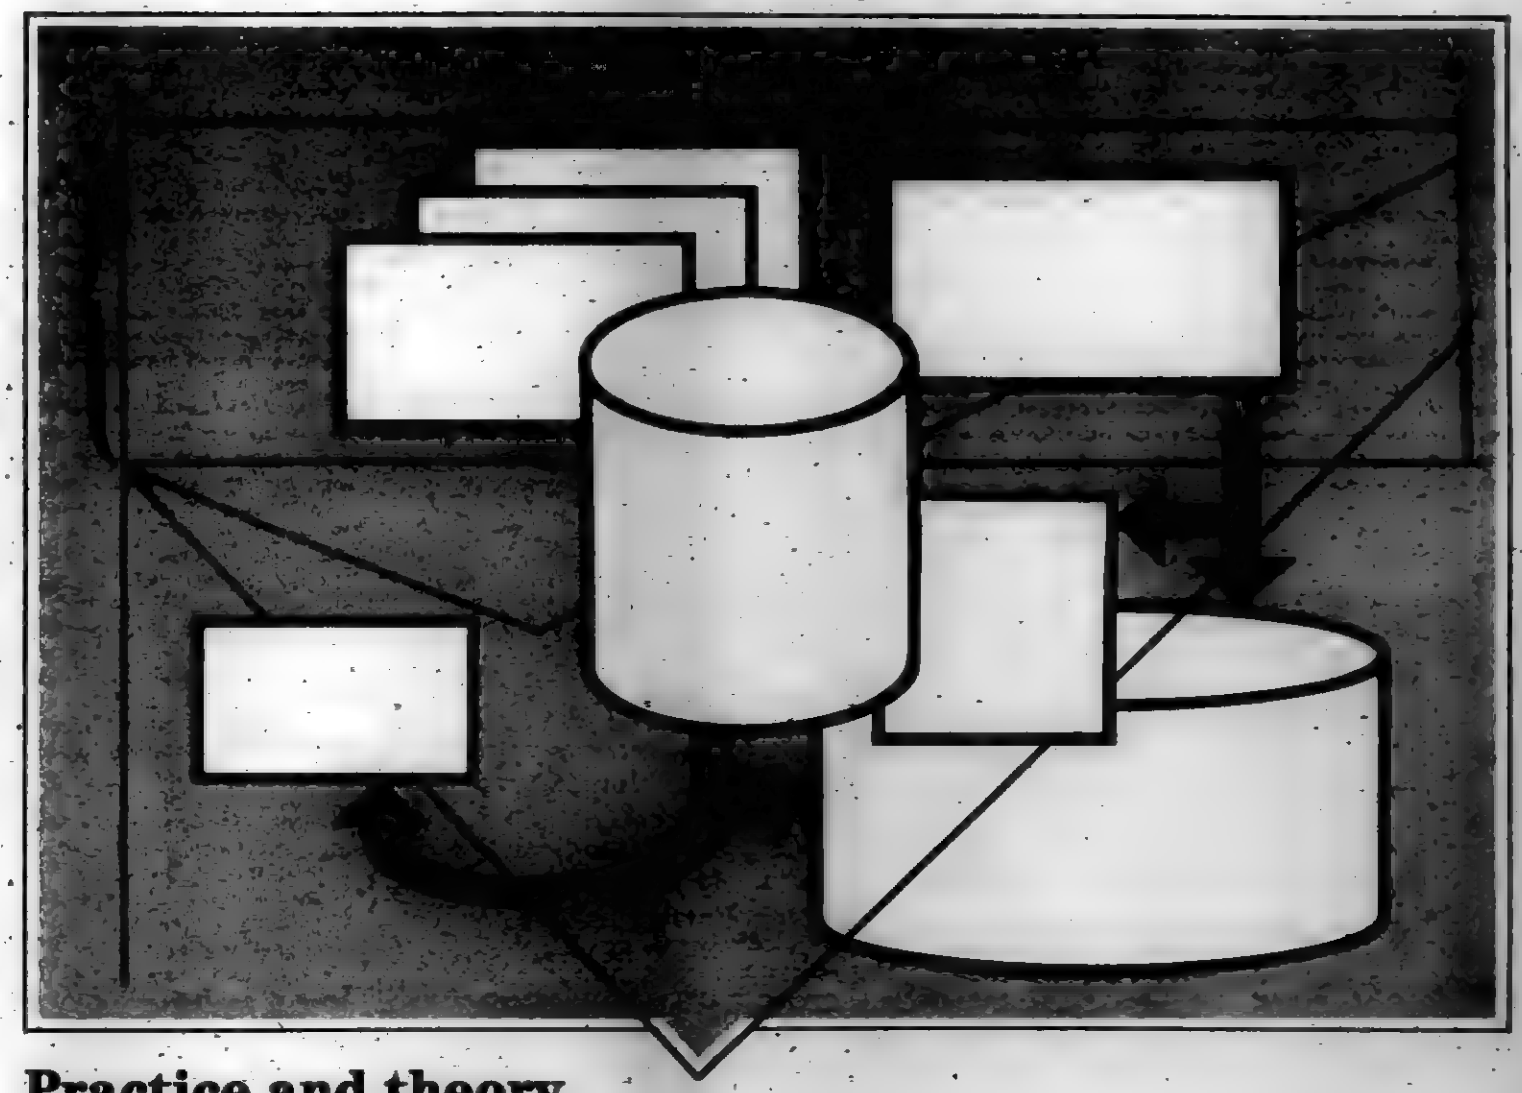
IN DEPTH



Practice and theory

How relational systems perform

Contrary to popular belief, relational DBMS can perform at least as well as, and quite possibly better than, older hierarchical or network systems. One of the developers of relational theory and practice explains why.

By C.J. Date

Misconceptions have grown up in the DP world these past few years about relational systems, and many of these misconceptions relate to performance. Two commonly heard opinions are:

"Relational systems are all very fine for ad hoc query, but they will never achieve the performance needed for production systems (or transaction processing systems or . . .)"

"Relational systems require a breakthrough in hardware technology such as associative memory before they will be able to achieve acceptable performance."

The contrasting opinion (and mine, needless to say) is:

"There is no intrinsic reason why a relational system should perform any worse than any other kind of system."

Ignoring, for the moment, the interference effects introduced when multiple transactions are run in parallel, we can concentrate on the performance of some given data base transaction considered in isolation. The two principal factors determining the performance of such a transaction are, of course, the number of I/O operations and the pathlength (amount of CPU processing).

Pathlength. The IBM products DB2 and Structured Query Language/Data System (SQL/DS) are *compiling systems*: User-level data base statements are compiled prior to run time into appropriate machine code instructions. Most other systems, relational or otherwise, are interpretive. But the advantages of compilation are widely recognized, and several other relational systems — for example, Oracle Corp.'s Oracle and Relational Technology, Inc.'s Ingres — are moving totally or partially to the compiling approach.

In this discussion, let us concentrate on compiling systems. The purpose of compiling is, precisely, to reduce the runtime pathlength. To be specific, all of the following operations are removed from the runtime path:

- Parsing the original user request.
- Detecting and reporting on syntax errors.
- Mapping logical-level names to physical-level addresses.

■ Choosing an access strategy.
■ Checking authorization.
■ Generating machine code.

Of these operations, easily the most significant from the performance standpoint is choosing an access strategy — in a word, optimization. The runtime pathlength is, thus, considerably shorter than it would be otherwise. What is more, the generated code is tailored to the original request and may be more efficient than more generalized, interpretive code.

Moreover, the performance benefits of compilation can be achieved without any corresponding loss of flexibility in operation. If recompilation becomes necessary (for example, if an index is dropped), the system can perform that recompilation automatically, thanks to an ingenious technique now known as "automatic bind," which was pioneered in the IBM research prototype System R.

The field of data base optimization today may be likened to the field of programming language optimization as it was some 15 or 20 years ago. Researchers are investigating the problem at universities and elsewhere, and the fruits of their work will no doubt eventually find their way into implemented products.

Note, incidentally, that compilation in the above sense (that is, *optimized* compilation) would not even be feasible in a record-level system, because the system would not be able to capture the user's intent in the same way. Thus, it is conceivable a relational system may ultimately involve *shorter* pathlengths than a nonrelational system (if, for example, the nonrelational system always has to parse requests at runtime).

I/O operations. The number of I/O operations required to satisfy a particular request is a function of the physical structure of the data base, not the logical structure; it has nothing to do with how the data base is perceived by its users, that is, as relations or as some other logical structure. (Of course, we are assuming here that the system does make a genuine distinction between the physical and logical levels, as a relational system does.) The question of how much I/O is needed in a relational system can, therefore, be broken down into two subsidiary questions:

1. Are the physical structures supported by the system capable of providing the kind of I/O performance needed?

2. If the answer to the first question is yes, then is the system capable of accepting high-level, relational requests (for example, a SQL SELECT statement or a QUEL RETRIEVE statement) and converting them into operations on those physical structures that are "as good as hand code" — as good as the code that would be produced by a skilled programmer working directly at the physical level?

Regarding the first question, most relational systems today support B-tree indexes. A few systems also support hashes and so on (for example, Ingres does), but B-trees are far and away the structure most often encountered in practice. In fact, there is little doubt that if a single physical structure has to be chosen, B-trees are the obvious choice.

Now, B-trees are certainly capable of providing adequate performance for many applications (this statement must be true, or nobody would use Vsam). On the other hand, some applications simply must use hashing to meet their performance requirements. Thus, the answer to the first question in most current systems is yes if indexes are acceptable for the application in hand; otherwise, no. (In the latter case, of course, the answer may still be yes for some other system.)

Assuming that the answer to the first question is yes, let us now consider the second: Can the system produce code that is as good as hand code? The short answer is yes, it can (in many cases, but not all). The function of the system optimizer is precisely to convert user-level statements into optimized machine code — where "optimized" means, basically, that the generated code employs the best strategy it can for satisfying the original request. In

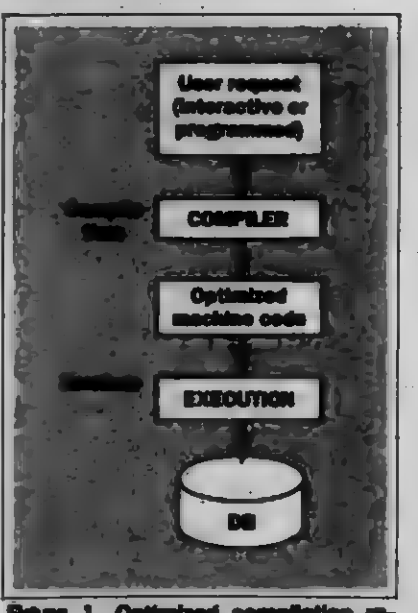


Figure 1. Optimized compilation reduces the runtime pathlength.

Computer Communications?

Whether it's office to office, office to corporate computer or office to data base service, Polygon software delivers reliable data transfer.

We've been developing communications software for micros, minis and mainframes for over five years. Experience that has paid off with comprehensive programs, documentation and effective menus for optimum user performance.

It's simple. Whether you use a modem, direct cabling or local area networks, our software talks directly from computer to computer. One more good reason why Digital Equipment Corporation and Interlan, Inc. sell and support our communications software with their products.

So, if you want to communicate, and you want to do it economically, reliably and easily, communicate with us... we're Polygon Associates.

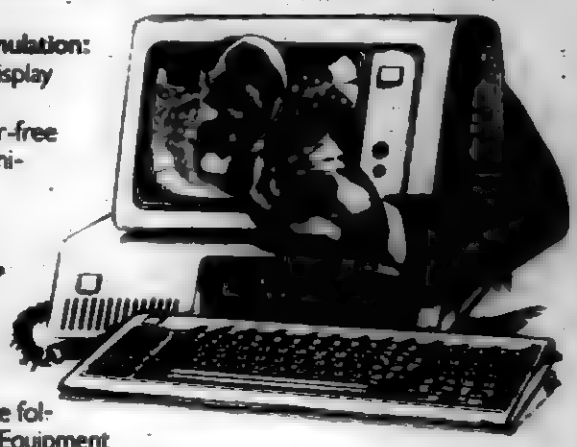
We have the software...

poly-TRM™ Asynchronous Terminal Emulation Software: For communication as a terminal to virtually any computer system including the Source[1], Dow Jones[2] and other commercial information services.

poly-BSC/RJE™ Bisynchronous Terminal Emulation: For Remote Job Entry (IBM 3780/2780) to IBM mainframes and compatible machines.

poly-BSC/3270™ Bisynchronous Terminal Emulation: For emulation of the IBM 3270 family of Information Display Systems, including file transfer.

poly-XFR™ File Transfer Software: For error-free ASCII and Binary file transfers among personal and minicomputers.



For all types of hardware...

Minicomputers using VMS, RSTS/E, RT-11 and RSX-11M Operating Systems[3], Intel and Motorola development systems. Systems using CP/M[4], in a user tailorable version.

Plus we support personal computers from the following manufacturers: Apple Computers, Inc., Digital Equipment Corporation, International Business Machines Corporation, Jonos, Osborne Computer Corporation, Radio Shack/Tandy Corporation, Televideo Systems, Inc., Victor Technologies, Inc. and Xerox Corporation.

1 The Source is a service mark of Source Telecomputing Corporation, a subsidiary of the Reader's Digest Association, Inc.
2 Dow Jones is a trademark of Dow Jones, Inc.
3 VMS, RSTS/E, RT-11 and RSX-11M are trademarks of Digital Equipment Corporation.
4 CP/M is registered to Digital Research, Inc.

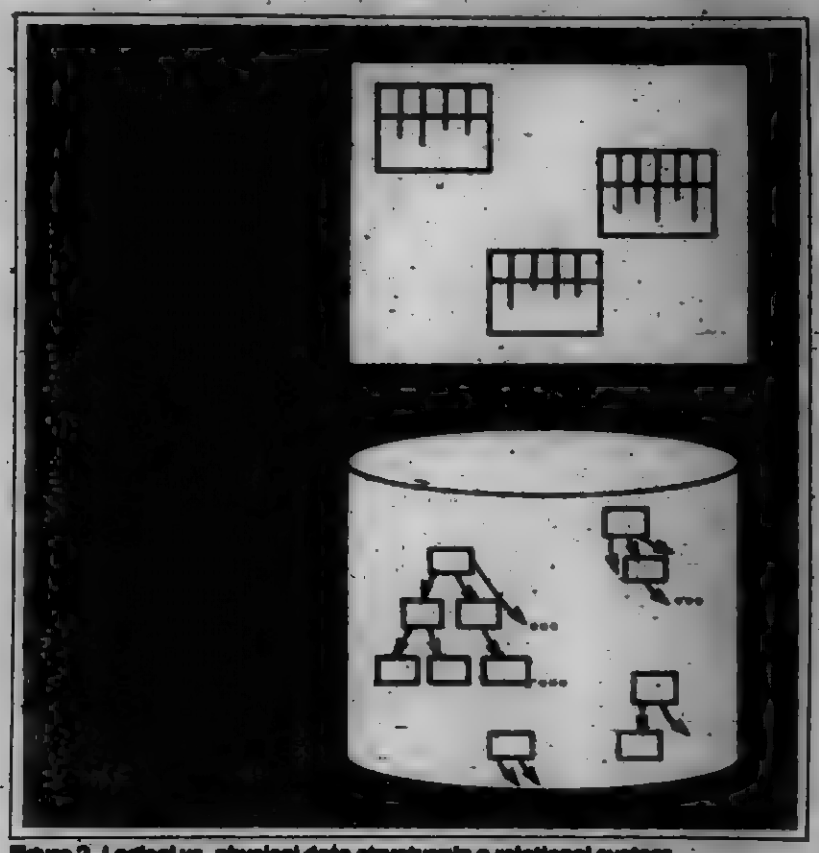

Figure 2. Logical vs. physical data structure in a relational system

DB2, for example, the optimizer will always try to make use of a "clustering index" if one exists that matches the requirements of the user-level statement. Of course, the optimizer does not produce the best possible code for every possible request, but then, neither do most human programmers.

Note, moreover, that we are talking here about products that are, for the most part, only at the stage of a first or second release — products, what is more, that are based on a brand new technology. It is reasonable to expect continuing improvements in the area of optimization throughout the lifetime of those products. Indeed, the field of data base optimization today may be likened to the field of programming language optimization as it was some 15 or 20 years ago. Researchers are investigating the problem at universities and elsewhere, and the fruits of their work will no doubt eventually find their way into implemented products.

Moreover, such enhancements can be made without in any way affecting the form of the external interface (that is what data independence is all about).

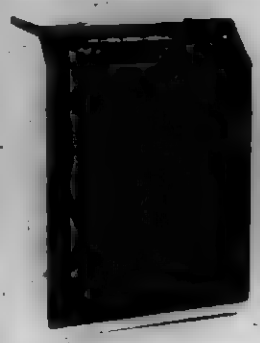
As a matter of fact, it is even conceivable that the optimizer might produce code that is better than hand code. It may well be the case that the optimizer has information available to it (regarding, for example, physical data clustering, table sizes and index selectivities) that a hand coder typically would not have. Moreover, that information may change with time. If it does, reoptimization may become necessary. Such reoptimization is trivial in a relational system; it simply involves a recompile and quite possibly an automatic one at that. It would be very difficult in a hand-coding system, requiring a program rewrite.

One final point regarding optimization: Relational systems may, in some cases, outperform nonrelational systems for another reason. The point is precisely that those relational systems are optimizing systems. High-level relational operations are optimizable precisely because they are high-level — they carry much semantic content, and the optimizer is, therefore, able to recognize what the user is trying to do and can respond in an optimal way.

Figure 3. Departments and employees in IMS (physical structure)

By contrast, in a nonrelational system, in which the user operates at the record level instead of the set level, access strategies are chosen by the user; and if the user makes a wrong choice, there is little chance that the system will be able to optimize that user's code.

As an example, suppose the (nonrelational) user is trying to compute the join of tables A and B. There are two possible strategies: 1) For each record of A in turn, find all matching records in B; 2) for each record of B in turn, find all matching records in A. Depending on such considerations as the relative sizes of A and B and (especially) their physical clustering characteristics, one of these strategies is likely to outperform the other by several orders of magnitude. And, as stated previously, if the user chooses the wrong one, there is really no way that the system can convert it into the other, because the user's choice is expressed as a sequence of low-level operations



Innovator 300 LPM Printer System

Now! Compatible with nearly any micro, mini, and mainframe.

The Innovator printer system can interface with your IBM, Burroughs, DEC, RS-232 Serial and many additional communication protocols. Also, the highly reliable, field proven Teletype™ mechanism provides years of virtually maintenance free performance, significantly lowering your cost of ownership. Starting at..... $4,995

FEATURES:
- Impact printer with fully formed characters
- Ultra quiet acoustically damped cabinet
- BSC/SNA compatibility
- Micro-processor controller/interface board
- 132, 80 column, heavy-duty print mechanism
- Low cost nationwide service

innovative™ network data communications

(305) 624-1044
1-800-327-3068

INNOVATIVE ELECTRONICS, INC., 4714 N.W. 165th Street, Miami, FL 33014

4-5-6™

When you need IBM mainframe applications with the capabilities of popular micro products, your next step should be to join over 150 companies that have already licensed software from Parallax Systems.

ExecuCalc™
Electronic spreadsheets for 3270 terminals

ExecuPlot™
Color business graphics for 3270 terminals

Training
On-site classes in ExecuCalc, ExecuPlot, Lotus 1-2-3, VisiCalc, VisiPlot, and SuperCalc are available.

Distribute your micro and mainframe application easily, and provide training for both, with software and services from Parallax Systems.

Interfaces via CICS, QUASI, VS, and DIF files.
Perpetual licenses $1500 per product. 30-day trial.

THE NEW 924. THE TELEVIDEO SUCCESS STORY (contd.)

TeleVideo® has combined the best innovations in technology, design and quality of manufacturing to bring you superior terminals. Now with the new 924 we've built in comfort and productivity features that leave the other manufacturers behind.

For user comfort, the 924 has a tilt and swivel non-glare screen and DIN-standard low profile keyboard. 16 programmable, non-volatile function keys (shiftable to 32) turn often used instructions into one key commands. Extra display features include full screen editing, character and block graphics, plus 32 non-embedded visual attributes. The 924's logical attributes define protected and unprotected regions for accurate data entry.

If you don't need the full power of the 924, our 914 has all the design advantages of the 924 at less cost.

Whatever your application, nothing measures up to TeleVideo. And nothing succeeds like the 924!

Call us at (800) 538-8725 for more information. (In California call (408) 745-7760) or contact your nearest TeleVideo office:

instead of as a single high-level operation.

It is sometimes suggested that a relational system must perform poorly as a system regardless of its efficiency with respect to any individual transaction (see, for example, "What Price Relational?" by William H. Inmon, *Computerworld*, Nov. 28, 1983). The argument is that relational systems will be running a mixture of planned transactions and ad hoc queries (short-running activities and long-running activities, to use Inmon's terminology) and that those two kinds of activity are mutually disruptive.

Now, it is true for any system (not just a relational one) that these two kinds of activity tend to interfere with each other somewhat, and there is no harm in drawing attention to that fact. But to suggest that relational systems will, therefore, have significantly worse performance than less flexible (hierarchical or network) systems is completely unwarranted, for at least two reasons:

■ First, the comparison is apples to oranges. It is extremely difficult to perform any kind of ad hoc activity at all on hierarchical and network data bases, with the result that those systems are almost invariably (de facto) devoted to planned activities. This fact does not mean that users would not like to be able to perform ad hoc access to those data bases if they could.

■ Second, there is no *requirement* to mix the two kinds of activity in a relational system. It is ridiculous to suggest, as Inmon did, that controls cannot be imposed in the relational environment. Of course they can, if the installation requires them. The authorization subsystem — which tends to be much more sophisticated in relational than in nonrelational systems, incidentally — provides an obvious example (not the only one) of an appropriate control mechanism. In Ingres, it is perfectly feasible to restrict ad hoc queries to specified hours of the day and/or days of the week.

Moreover, even if such controls do prove necessary in some installations, the user will still enjoy all the other advantages of relational technology (ease of use, speed of application development, resilience to change and so on) and, in addition, will be able to perform ad hoc access at controlled times. Furthermore, at many installations such controls will not be necessary, because the overall performance requirements will be less stringent. Balancing the requirement for ad hoc data availability vs. the control needed to guarantee specific levels of performance is a trade-off like any other.

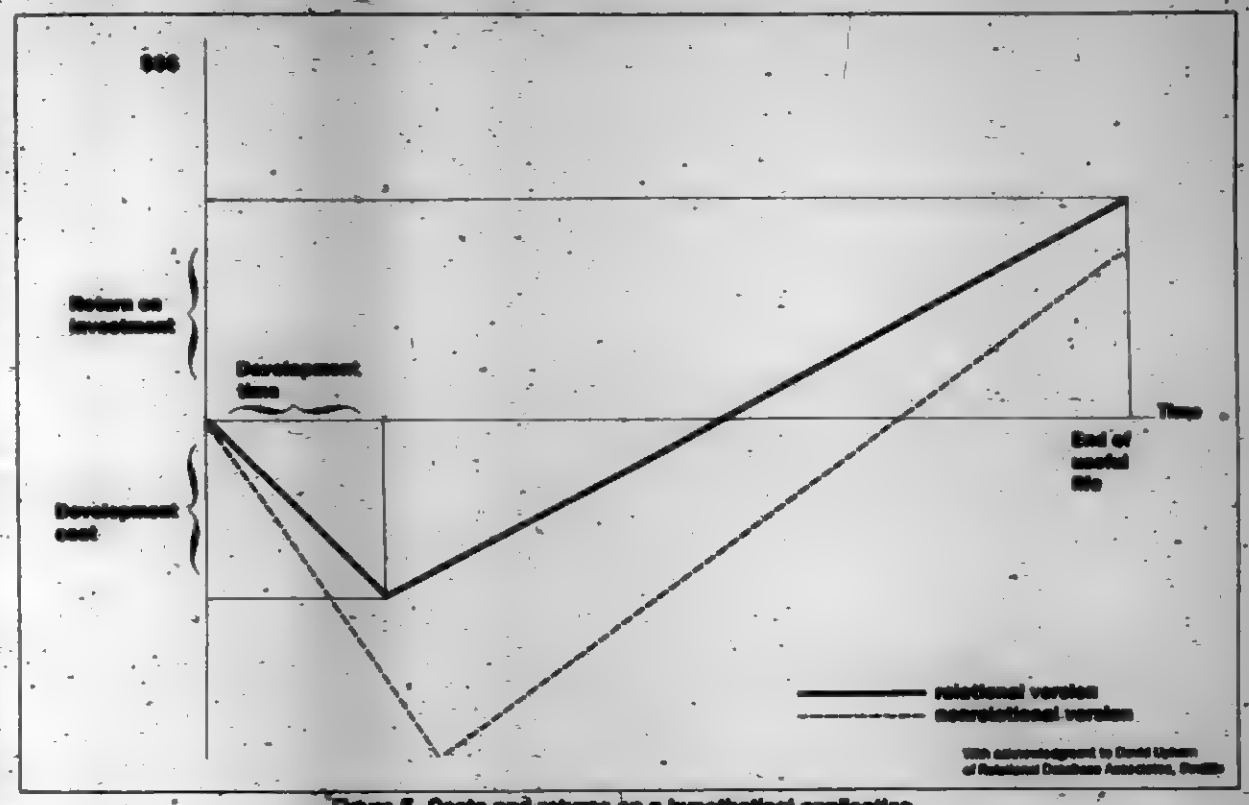

Figure 5. Costs and returns on a hypothetical application

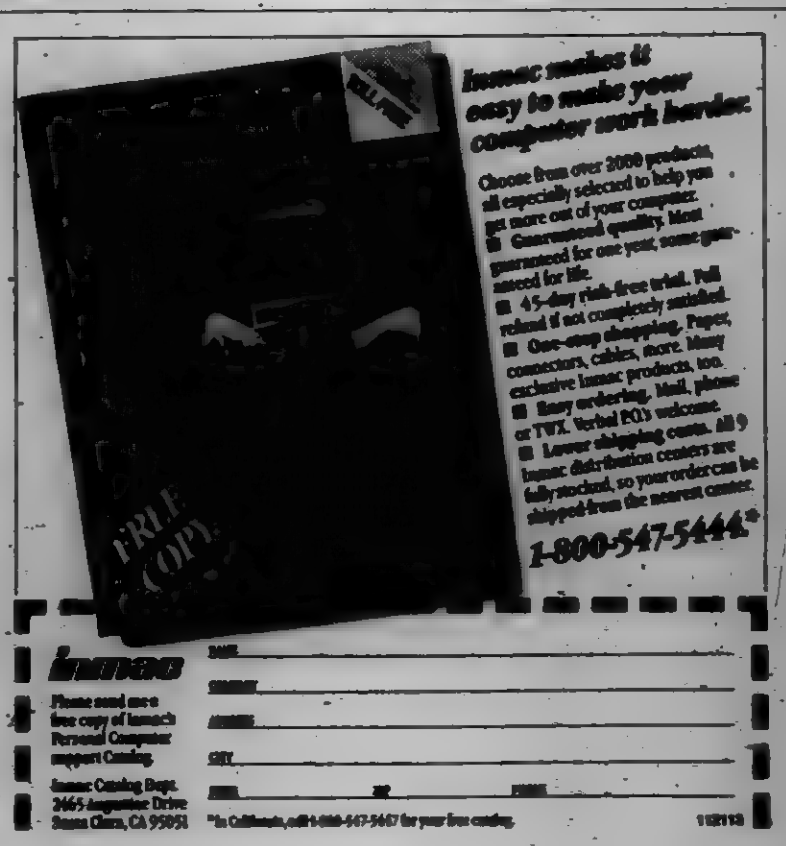
DB2 vs. IMS

I conclude that there is absolutely no reason a relational system that is implemented on perfectly conventional hardware using perfectly conventional software techniques should not perform perfectly well. A hardware breakthrough is not required (though if, for example, cheap large-capacity associative memory ever did become a commercial reality, it would certainly be easier to take advantage of it in a relational system than in a nonrelational one).

Of course, I should emphasize that the foregoing discussions are all very general. I am not saying that a system like DB2 today is able to perform as well as a long-established system such as IMS. In the case of DB2 in particular, it is probably too early even to give any kind of performance figures, though it is a safe bet that any such figures would be substantially less attractive than the corresponding figures for IMS. There is little doubt that *for a given application*, where the data structures and the transaction patterns are very well understood ahead of time, an established system like IMS can be customized and configured to produce more impressive performance than a system like DB2 can — today. On the other hand:

1. That customized system may not look so impressive when other

Figure 4. Departments, employees in a relational system (physical structure)



applications are added to it. Implementing application B on a system that is customized to application A is like cutting wood against the grain — extraneous considerations keep getting in the way. And note that these comments apply not only to system performance but also to the logical structure of the system as perceived by the user (that is, application B will probably be more awkward to write as well).

Logical data structures in a nonrelational system tend to be biased toward some applications and against others, precisely because they closely reflect the physical data structure. Logical data structures in a relational system, by contrast, are more neutral: The application bias shows not in the logical data structure but in the manipulative operations, which by definition are far more flexible than the comparatively static data structure. (The bias will, of course, also show in the physical data structure.)

2. To amplify on the first point: Consider the standard departments-and-employees data base, and consider two typical transactions: (T1) find a specified department and all of its employees; (T2) find all departments. In IMS, the data would typically be organized as a two-level hierarchy, with, for example, index access to departments and pointer access from each department to its employees. This arrangement gives good performance for transaction T1 but bad performance for transaction T2. In a relational system, the data could be physically arranged either as in IMS or, perhaps more usually, as two physically separate sets of records, each with a corresponding index. The first of these arrangements would give essentially the same performance as IMS for both T1 and T2; the second would give somewhat worse performance than IMS for T1 (typically four I/O operations instead of two) but much better performance than IMS for T2 (N times fewer I/O operations, where N is the number of records per page).

3. One reason for the performance advantage of nonrelational systems is simply that those systems have been running for 10 or 15 years and have been constantly improved and tuned throughout that time. Relational systems will improve, too, over the next few years. Moreover, it is not clear that further significant improvements are even possible in a nonrelational system, whereas the field is wide open for such improvements in the relational case.

4. Even if the nonrelational system provides superior runtime performance, the value of that benefit has to be balanced against the amount of time it takes to get the system operational in the first place (not to mention the amount of time spent in subsequent maintenance). The installation's investment will be recovered more quickly with a relational system than with a nonrelational one, because applications will be running sooner. The ultimate return on investment may be higher, too, if the application lifetime is less than the time it takes for the nonrelational version to "catch up," economically speaking, with the relational one.

But let me repeat that all of the above is somewhat theoretical. As stated earlier, a system like DB2 today is extremely unlikely to achieve the performance level of a system like IMS today. The trade-off that must be considered today is performance vs. usability — or, to put it another way, machine productivity vs. people productivity.

Now, it is a truism that people costs are rising fast and machine costs are falling, also fast. As a result, people productivity is very rapidly becoming the dominating factor in many applications; in many cases, it already is. For such applications, relational systems are obviously ideally suited, even at their present level of performance.

However, there are also many applications in which raw machine performance is still the overriding concern. Thus, systems like IMS will have a major role to play for several years to come. And even if relational systems do eventually achieve parity in performance (as I, for one, am convinced they will), the huge investment in nonrelational systems is sufficient to ensure the continued existence of those systems for the foreseeable future.

Human beings are notoriously reluctant to expend the effort needed to learn something new, even when the advantages of doing so are obvious. Witness the fact that, even today, some applications are still written in assembler language instead of in Cobol or some still higher level language. This reluctance is one reason why IBM views DB2 — at least for now — as complementing IMS, not replacing it, and designed the two products to work in harmony as a single cooperating system.

About the author

C.J. Date is an independent author, lecturer and consultant who specializes in relational data base systems. He is based in Saratoga, Calif. In 1967, Date joined IBM in England, where he worked on the integration of data base functions into PL/I. In 1974, he moved to the IBM Development Center in California, where he was responsible for the design of Unified Database Language (UDL). More recently, he was involved in technical planning and externals design for the IBM relational products SQL/DS (announced in 1981 for DOS and in 1983 for VM) and DB2 (announced in 1983 for MVS). He left IBM in May 1983.

This article is based in part on material from Date's book, A Guide to DB2, to be published by Addison-Wesley this year.

How to load your 38 for maximum MRP performance

Not many System/38 users know how. Perhaps you already found that out by using another system. If this is your first time, check out the features that are important to you. Our users enjoy the benefits of a closed-loop MRP II system that allows direct access for anyone to all the information stored. We have a query facility that lets you generate user reports. And we utilize an advanced data base architecture which increases programmer productivity, making changes needed for expansion simple and economical. We even have a PC link which lets you transfer information to your IBM Personal Computer for interaction with popular planning micro products such as 1-2-3® from Lotus.®

Loaded with RMS/38 the potent IBM System/38 can make your business hum with the precision these economic times demand. Loaded with anything else you may have to settle for second best. In the fiercely competitive arena for manufacturing management efficiency, where survival depends on increased productivity—and profits—the software system you use can spell the difference between satisfaction or frustration, maybe even success or failure.

Only RMS/38 has 15 powerful applications to provide you with all the ammunition you'll ever need for total control. Control, not only of manufacturing but all those vital support functions as well, including distribution and finance. Total software...RMS/38!

Reduce inventory; eliminate parts shortages; acquire time for skillful buying; schedule production based on demand, not parts availability; determine whether to buy or build needed components; improve part number, inventory, and routing accuracy; and order in time for delivery on time. You can with RMS/38.

If your present MRP system, whether manual or automated, represents something less than a total integration of business and manufacturing systems; if it doesn't offer the distribution and financial support of closed-loop MRP II; if it doesn't offer you control in an unpredictable environment; then maybe it's time you investigated the building block software of RMS/38.

For a free demonstration or more information, contact PCR, Professional Computer Resources, 2021 Midwest Road, Oak Brook, IL 60521 (near Chicago). Also in New York, San Francisco and Los Angeles.

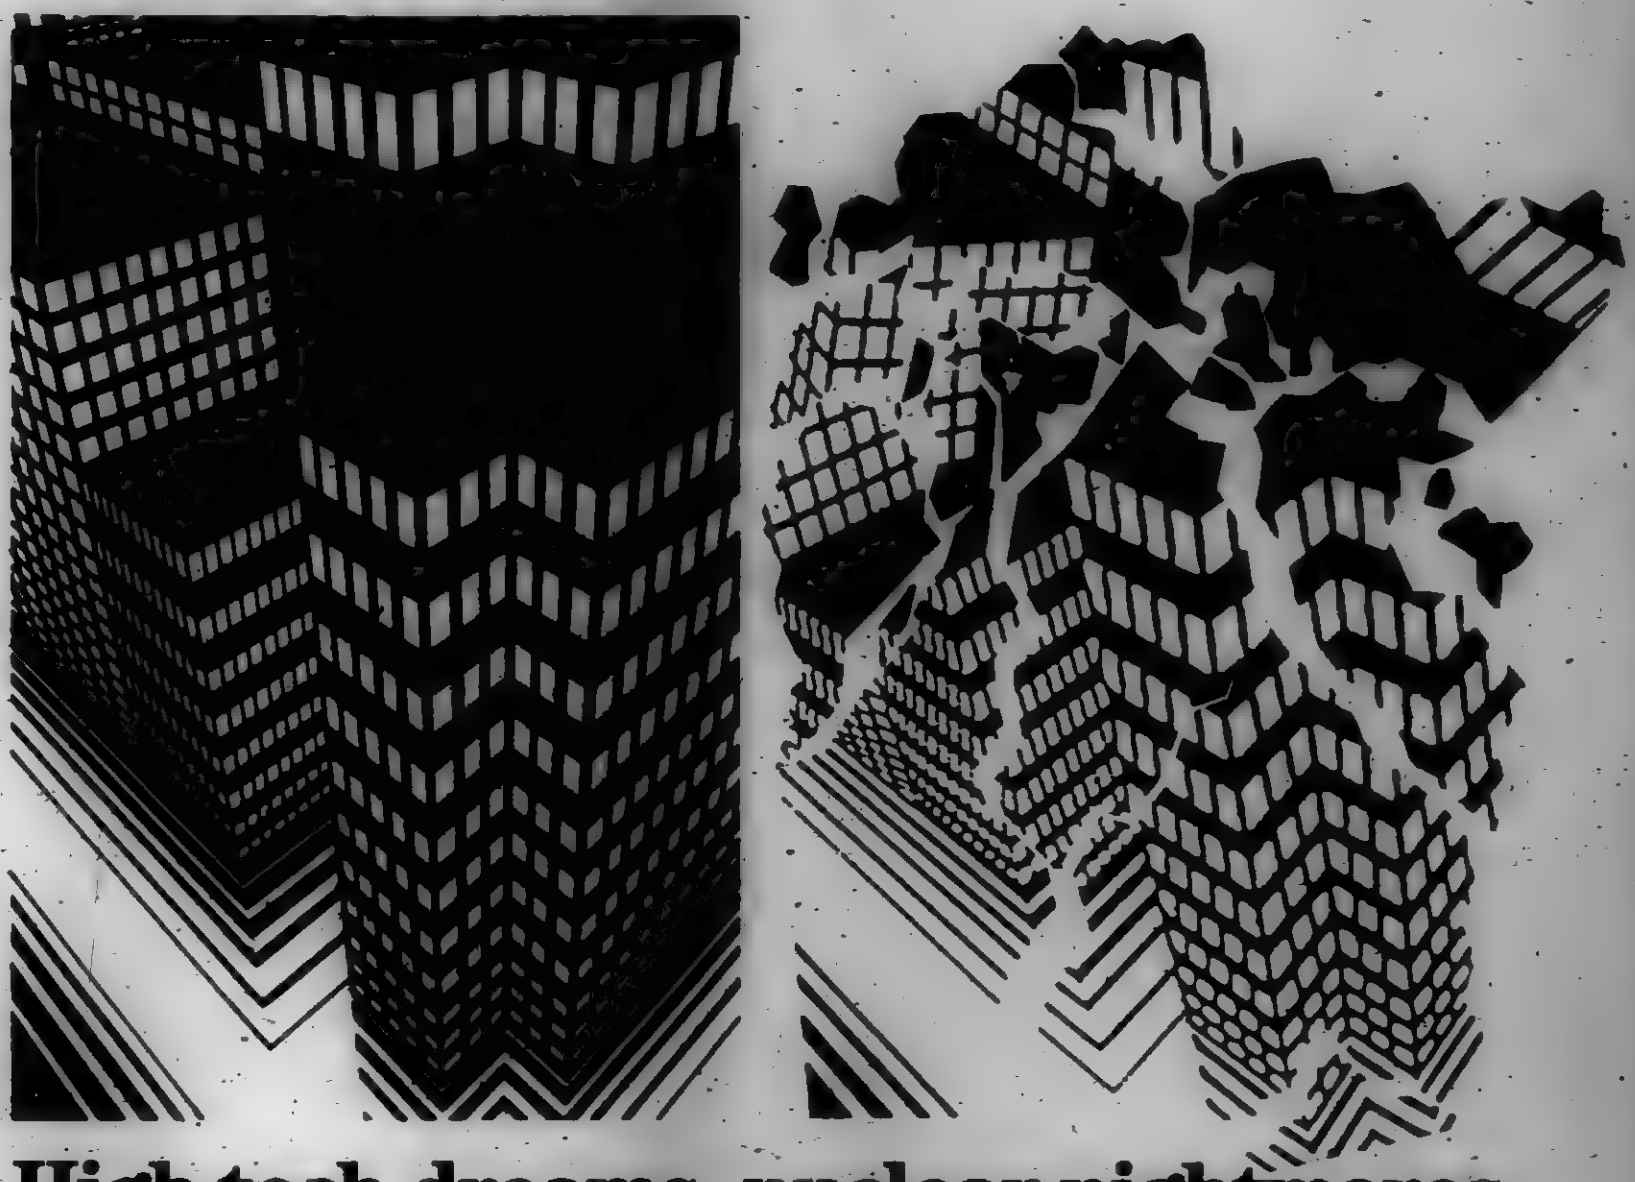
IN DEPTH



High-tech dreams, nuclear nightmares

Some in the ranks of data processing are challenging the unrestrained application of high technology to military purposes. Though still an apparent minority, they are organizing and questioning: What is the responsibility of the technical community in the nuclear age?

By Mark Hall

Dave Caulkins left his job with the Pentagon's Minuteman missile program "for moral reasons." With John Larson, a programmer for Xerox Corp., he established a computer conferencing system in Palo Alto, Calif., to foster discussion about arms control and disarmament among programmers, computer scientists and engineers.

Consultant Arthur Fink founded the Center for Appropriate Computing in Wilton, N.H., to encourage debate among "those who use or are touched by computer technology." Typical workshops: "The Computer and Personal Values" and "Computers and Religious Values." Fink says, "We should all affirm that we face ethical questions in our industry."

High Technology Professionals for Peace (HTPFP) opened an employment agency in Boston two years ago dedicated to finding nonmilitary-related jobs for anyone in the computer, engineering or scientific fields.

"The technical community has a particular responsibility to interpret the technical information presented to the general public by government, the weapons laboratories and certain research organizations," says Josie Stein, an HTPFP board member. "For example, the Heritage Foundation did a so-called 'scientific study' claiming we need 400 space-based battlestations to defend against ICBMs. That's technical nonsense. And it is the technical community's responsibility to explain the physics, mathematics and engineering principles that make it nonsense."

Isn't state-of-the-art military technology secret and, therefore, not explainable to the public? Stein replies: "The laws of physics are not classified."

Some of the designers, programmers and builders of the most destructive weapons systems ever conceived are now rebelling against their own designs, looking beyond the cleverness of the technology and considering its repercussions. Does the development and deployment of a computer-reliant defense, in fact, give the superpowers less control over the instruments of peace and war?

"Technologists," says Lucy Suchman,

co-director of the Palo Alto chapter of Computer Professionals for Social Responsibility (CPSR), "have an obligation to be as clear and honest as possible about the capabilities of technology and the choices available."

As Fink points out, "Just because a particular technology works does not mean it should be applied."

Joel Yudken of the Mid-Peninsula Conversion Project, a Silicon Valley organization dedicated to finding nonwar-products work for technologists, states that in the U.S., one-third to one-half of all scientists and engineers are employed in military-related programs. He says the Pentagon's demand for engineers in California alone will outstrip the state's ability to graduate them.

William Cutler, a systems engineer with Lockheed Missiles & Space, Inc. in Sunnyvale, Calif., observes that sometimes military programs "dry up" civilian projects and force technologists within a company a transfer to jobs that "may offend an individual's ethics," raising the basic dichotomy of choosing between one's personal beliefs or familial and economic responsibilities.

Beyond the morality of working on nuclear weapons systems, technologists are beginning to question the validity and capability of the technology itself. Dr. Severo Ornstein, a computer scientist with Xerox's research center in Palo Alto, points out that as defense systems increase in complexity, they require more computer processing. "Larger and larger pieces of the decision-making apparatus get turned over to computer systems. The more one turns over to machines, the more one becomes vulnerable to their fallibility."

The primary concern is the role of technology in the world's nuclear arsenals. Nobel Prize Laureate Owen Chamberlain says of his role in the Manhattan Project, "It seemed like a right thing at the time." Some in the technological community today are realizing that being part of developing powerful weapons means they may forever "be known as those that prepared the world for the great catastrophe."

The fact that those who lead the military even consider nuclear weapons in their war scenarios today appalls Chamberlain. It is equally disturbing to him and others that scientists and engineers persist in designing products that fit the war planners' imaginations. Dr. Oak Knoll, a theoretical chemist formerly with the Los Alamos and Sandia weapons laboratories, believes that scientists delude themselves by proclaiming their research "neutral." "That way they don't have to confront the difficult question of morality," he says. "They believe that they are not responsible for its application."

As one of the founders of CPSR, Ornstein represents increasing discontent among the nation's technologists and scientists. "When I got concerned about my children and my grandchildren, not to mention me, and when I believed genuinely that our lives were in jeopardy, I thought that I should do whatever I possibly could by whatever means were at my disposal."

Although CPSR is a young organization (begun in the summer of 1982 and granted nonprofit status the next spring), it has 400 members in Boston, Seattle, Madison (Wis.), Los Angeles, Berkeley, Palo Alto, San Jose, Santa Cruz (Calif.) and New York chapters. It sponsors forums and provides speakers on the technical issues surrounding nuclear weapons. The group was represented at the International Joint Conference on Artificial Intelligence and has been invited to the Association for Computing Machinery's annual conference. Among the more well-known members are Joseph Weizenbaum of MIT and Terry Winograd of Stanford University and the Xerox Palo Alto Research Center.

CPSR is among a number of growing organizations claiming to represent the social concerns of technologists and scientists. High Technology Professionals for Peace, founded in 1981, recently opened a Boston office for its 200-member organization. Fink's Center for Appropriate Computing and Yudkin's Mid-Penninsula Conversion Project are also less than two years old.

Of course, groups like The Union of Concerned Scientists have been prodding the consciences of scientists for decades. Individuals with no less stature than Albert Einstein have called on their peers to re-evaluate their work from a moral, rather than merely a scientific, perspective. Today, the Pentagon's widening impact on the research and development community has spurred new levels of anxiety among high-tech

"Your Information, Sir!"

FQS allows end-users to query the computer for every information request, *instantly.*

No more burdening the DP department with programming of ad hoc reports. No more need to learn higher level languages which are still gibberish to an end-user.

FQS is the only CICS or SHADOW-based information retrieval system designed to be on-line from day one. It contains all of the best facilities for sorting, selecting, and printing contained in EASYTRIEVE/on-line, SQL and other batch systems. But FQS is instant, a true on-line query system, menu-driven to allow anyone to get information quickly. Security procedures allow you to control access to valuable corporate information.

Surely, you've outgrown that old batch report writer by now. Isn't it time you moved beyond batch reports and into the simplified world of on-line queries?

Your users will get exactly the information they need because *they* define it. They will have results in mere seconds. And, your programming staff will be freed to spend their time more effectively.

Call today for complete details on FQS, the Friendly Query System. Go on-line. Go Allergo.

"You really must experience FQS. Call Allergo today."

A THORN EMI Company

Introducing MARK V™ for CICS users: a *unique*, 4th generation non-procedural application development system that saves you time and money at every stage of your application life cycle. See it at a free seminar near you!

Informatics just broke the productivity barrier with MARK V, an extraordinary timesaving application development system. But, MARK V is not for everyone. *It may be for you if:*

- ☑ You need help in reducing your backlog of medium to complex CICS applications.
- ☑ You use CICS with IBM-supported data access such as VSAM or DL/I.
- ☑ Your CICS system demands highly efficient application execution.

Then, MARK V can help you produce efficient compiled applications that rival the execution of well-written COBOL—in less than half the development time!

Easy application development and maintenance is just the beginning!

MARK V improves productivity throughout the application development and maintenance cycle—not just in the coding—by providing:

- Interactive application design and simulation
- Easy to use, menu-driven specification language for development and maintenance
- Transparent and complete data access/communications control
- Automatically produced application documentation

That means, with MARK V your programmer need only specify the solution. MARK V generates the *complete* application. This methodology allows you to solve more complex problems more efficiently using less highly trained personnel—*and that saves you money!*

Reserve your place at a *free Seminar* on MARK V—the simple new way to develop and maintain your medium to complex CICS applications.

As a data processing professional, you're also a professional skeptic. But the simplicity, versatility and timesaving capabilities of MARK V are easy to see—and prove. To do so, simply mail the coupon below or call toll free. We'll reserve your place at a free MARK V Seminar in a city near you. But attendance is limited. So mail this coupon or call *today*.

Honeywell computers help Trailways move over 20 million people a year at the touch of a button.

Trailways faced a challenge recently. They wanted to improve cash management, the accuracy of pricing and scheduling, and the efficiency of their terminal operations.

So they came to Honeywell, and together we worked out a solution based on our microSystem 6/10. Now, at the touch of a button, ticket agents can see schedules, routes and rates for thousands of Trailways' destinations. The possibility of error is all but eliminated. The system even prints the tickets automatically.

Trailways' managers will benefit by having faster access to data. For example, the system facilitates interline accounting and furnishes feedback on marketing campaigns—a critical edge in a newly deregulated environment.

What's more, the microSystem 6/10 is easy to use, easy to program, and compatible with the Honeywell minicomputer and mainframe host at Trailways' home office. (Only Honeywell has total instructional set compatibility for micros, minis and mainframes.)

The microSystem 6/10 has 512K of memory. More than enough to handle the vast amounts of rate/schedule data Trailways must store, as well as information on daily transactions.

And the system is a snap to install, reliable, and backed up by Honeywell's nationwide service organization.

Information control. That's what keeps Big Red rolling.

For more information on the microSystem 6/10 and the advantages of full-line compatibility, call 800-328-5111, ext. 2708 (In Minnesota, call collect 612-870-2142, ext. 2708) or write Honeywell Inquiry Center, 200 Smith Street (MS 440), Waltham, MA 02154.

Together, we can find the answers.

Honeywell

professionals.

According to Alex Brown, co-founder of HTPFP, "It is all too easy to accept uncritically the traditional arguments about military R&D that conceal its nature: That U.S. military R&D is a direct response to foreign R&D challenges, that military R&D serves the security needs of the American people and that it does, indeed, increase the stability of world order. All [those arguments] are false and must be discarded before a realistic route toward a safe world can be planned."

Dr. Jack Jennings, a senior systems engineer with TRW, says that working on the tools of war is "a waste of time, talent and resources." He believes there exists a "mechanism geared within the system to destroy society and mankind as a species" and that it may be impossible to stop.

Dr. Hugh DeWitt, a Lawrence Livermore Laboratories physicist, sees institutions that provide technological know-how for the military, such as his own employer, as "isolated from the rest of the scientific community, from the rest of American society."

Conspiracy of silence

As Jennings points out, technologists and scientists generally like "to have fun learning something new," which is what attracts them to the well-funded weapons labs and weapons contractors. But there they often become isolated from the political and social questions raised by their work. Prof. Bernard Roth of the Stanford Mechanical Engineering School sees "a conspiracy of silence within the technical community."

Limiting the free exchange of knowledge, Chamberlain believes, contributes to the possibilities of nuclear annihilation. He also worries about the "revival of McCarthyism" in the scientific community. He describes as a devastating move the Reagan administration's executive order forcing the review of writings by individuals who may have worked on classified projects. In the scientific community, publication is the ultimate criterion for recognition and success.

Chamberlain believes that beyond creating a central clearinghouse controlled by bureaucrats and not peers, the policy will have a dramatic impact on scientific and technical achievements in the U.S. Scientists might reconsider the attractiveness of working within an industry that constrains individual rights and possible career advancement.

The primary fear, however, remains that the technological designs scientists dreamed and executed now hold mankind by the throat. Weapons systems now seem to surpass rational man's ability to manipulate them. Trident, Pershing II and MX missile systems are the most flamboyant execution of high technology.

Brian Smith, president of CPSR, says that these weapons "may force the Soviets to implement a 'launch-on-warning' program because the weapons can reach their targets

Technologists employed at the well-funded weapons labs often become isolated from the political and social questions raised by their work.

quickly and with pinpoint accuracy. Computers become the sole interface between the decision to launch a nuclear arsenal or to hold the bombs in check, since only computers could possibly detect an attack and retaliate in time."

Ornstein says it is "not our reliance on computers that scares me nearly as much as the Russians' reliance on computers." Even if U.S. war technology operates as designed with all possible safeguards against accidental launch, those at whom the weapons are directed are compelled to respond — with systems that may be archaic and inadequate.

Doubts about performance

There are also lingering doubts about our dependence on high-tech defense. Skepticism abounds within engineering and scientific journals about the performance of "ultimate defense weapons."

Fred Kaplan wrote in *High Technology* magazine that experts believed the Tomahawk Cruise missile was "a dud, a high-technology application of questionable military value." The Harvard Study Group concluded, "The arms race in recent years has been not in numbers, but in technological improvements." Its report, *Living With Nuclear Weapons*, published by Harvard University Press, exposes the limitations of technology as being more dangerous than the capabilities. And yet arms agreements are predicated upon the capabilities.

As Desmond Ball pointed out in his article for the International Institute of Strategic Studies, the most sophisticated nuclear war-fighting capability may, in fact, "be impossible to realize." Yet publicized capabilities of the U.S. could frighten the Soviets into a pre-emptive strike. High-tech weapons could turn out to be a gossamer Maginot Line made of blueprints and scientific ideas that never could work in the real world.

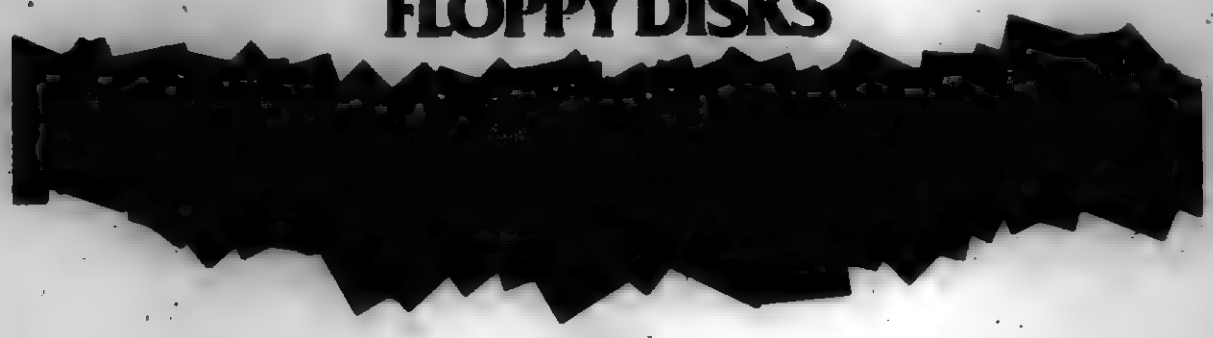
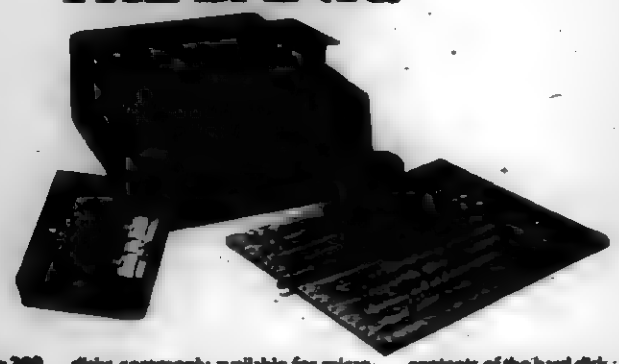
Mark Hall is the technical editor for Micro Communications, *a monthly magazine based in San Francisco. He has contributed to a number of technical publications as well as historical academic journals.*

1000 FLOPPY DISKS



VS. THE BANK.



Savings you can take to the bank: 200 MB only $2,195. CORVUS is proud to introduce the BANK.

It's the most dramatic breakthrough in low cost, high capacity mass memory systems since CORVUS introduced the Winchester disk for microcomputers in 1979.

The BANK's removable tape cartridges hold up to 200 megabytes of information. That's equal to 1000 double density floppies or 10 times the capacity of the largest hard disks commonly available for microcomputers. You can use the BANK to complement a Winchester disk. It has 19 times the capacity.

And the BANK's cartridges are removable for unlimited capacity and storage.

On-line archival back-up you can bank on. You can use the BANK as a random access archival device. If your Winchester disk fails, you can restore selected volumes without having to restore the entire contents of the hard disk.

The BANK is the perfect solution to your back-up storage problems as a shared storage device on OMNINET™ — the leading Local Area Network for microcomputers.

Call CORVUS for the name of the dealer nearest you. We're sure you'll smile....all the way to the bank.

For more information contact: CORVUS SYSTEMS, 2100 Corvus Drive, San Jose, CA 95124, 1-800-4-CORVUS.

CORVUS

THE NETWORKING COMPANY

The BANK connects up to eight hands of computers using OMNINET Local Area Network TRANSPORTER™ interface cards. The BANK is currently available for the CORVUS CONCEPT™ and the IBM PC™ CORVUS, THE NETWORKING COMPANY, the BANK, OMNINET, CORVUS CONCEPT and TRANSPORTER are trademarks of CORVUS SYSTEMS, INC. IEEE Project 802

Setting standards for local-area networks

By William Stallings

Development of the local-area network market depends on the availability of a low-cost interface. The cost to connect equipment to a local network must be much less than the cost of the equipment alone. This requirement as well as the complexity of the local-area network protocols dictate a very large-scale integration (VLSI) solution.

Chip manufacturers will be reluctant to commit the necessary resources without a high-volume market. A local-area network standard would ensure volume and also enable communication among equipment from a variety of manufacturers.

The Institute of Electrical and Electronics Engineers Computer Society established IEEE Project 802 in February 1980 to draft a local-area network standard. The work of the 802 committee has now come to fruition. Several parts of the proposal are now working their way through national and international standards organizations, and the remainder will follow soon.

The task of IEEE 802 was to specify the means by which devices could communicate over a local network. The committee characterized its work as follows:

"A local network is a data communications system that allows a number of independent devices to communicate with each other. This standard defines a set of interfaces and protocols for the local network.

"A local network is distinguished from other types of data networks in that the communication is usually confined to a moderate-size geographic area such as a single office building, a warehouse or a campus. The network can generally depend on a communications channel of moderate to high data rate which has a consistently low error rate. The network is generally owned and used by a single organization, in contrast to long-distance networks which interconnect facilities in different parts of the country or are used as a public utility. The local-area network is also different from networks

The objective of the local-area network standard is to ensure compatibility between equipment made by different manufacturers. The world of local networks will rapidly become an IEEE 802 world. As IEEE 802 products become widely available, nonstandard offerings can be expected to wither away — with two exceptions.

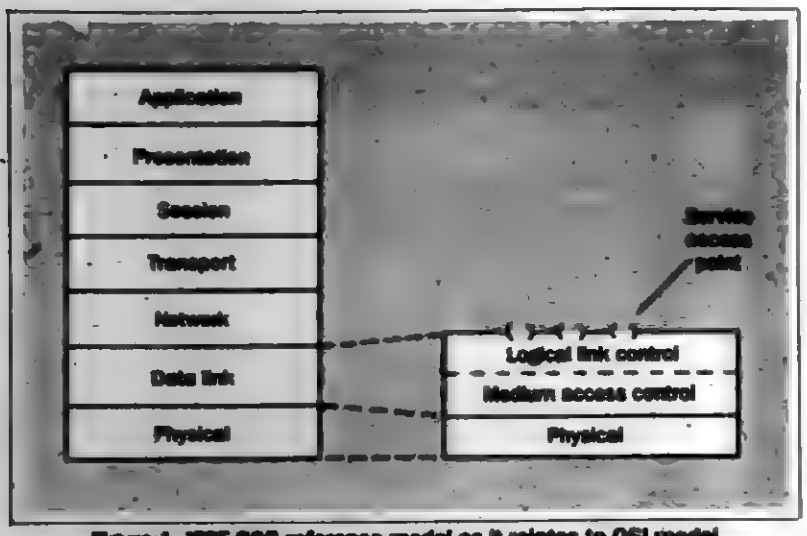

Figure 1. IEEE 802 reference model as it relates to OSI model

that interconnect devices on a desktop or components within a single piece of equipment.

"The objective of the local network standard is to ensure compatibility between equipment made by different manufacturers such that data communications can take place between the devices with a minimum effort on the part of the equipment users or the builders of a system containing the equipment. To accomplish this, the standard will provide specifications that establish common interfaces and protocols for local-area data communications networks."

The committee quickly reached two conclusions. First, the task of communicating across a local network is sufficiently complex that it needs to be broken up into more manageable subtasks. And second, no single technical approach will satisfy all requirements.

The first conclusion is reflected in a "local network reference model," compared in Figure 1 to the better-known open systems interconnection (OSI) model. The local network reference model has three layers:

Physical: This layer is concerned with the nature of the transmission medium and the details of device attachment and electrical signaling.

Medium access control: A local network is characterized by a collection of devices all needing to share a single transmission medium. A means to control access is needed so that only one device attempts to transmit at a time.

Logical link control: This layer is concerned with establishing, maintaining and terminating a logical link between devices.

The committee reluctantly reached the second conclusion when it became apparent that no single standard would satisfy all participants. There was support for both ring and bus topologies. Within the bus topology, there was support for two access methods (carrier-sense multiple access with collision detection [CSMA/CD] and token bus) and two media (baseband and broadband). The response of the committee was to standardize all serious proposals rather than to try to settle on just one. The result is shown in Figure 2.

The work of the IEEE 802 committee is currently organized into the following subcommittees:

- IEEE 802.1 Higher Layer Interface Standard.
- IEEE 802.2 Logical Link Control Standard (LLC).
- IEEE 802.3 CSMA/CD.
- IEEE 802.4 Token Bus.
- IEEE 802.5 Token Ring.
- IEEE 802.6 Metropolitan Area Network (MAN).

The Higher Layer Interface subcommittee is not developing standards, but rather is working on a variety of related issues such as higher layer interfaces, internetworking, addressing and network management.

Work has been completed on LLC, CSMA/CD and token bus for an initial standard. All three are now approved IEEE standards (IEEE Std. 802.2-1983, 802.3-1983 and 802.4-1983 respectively). Work continues on token ring within IEEE 802, with the intention of passing it to the IEEE Standards Board by the middle of this year.

The work on metropolitan area networks has as yet made little progress. The subcommittee is attempting to develop a small number of reasonable alternatives for further study.

The acceptance of the IEEE 802 standards has been remarkably widespread. The National Bureau of Standards, which issues Federal Information Processing Standards (Fips) for U.S. government procurements, has announced the intention of issuing Fips for CSMA/CD and LLC. The others will probably follow. The International Standards Organization (ISO) has decided to adopt the IEEE 802 documents in toto as Draft Proposed Standards. This is the first step in the development of international standards. The influential European Computer Manufacturers Association (Ecma), which had been actively drafting its own local-

Mom files best.

Introducing PC/COM.™ Truly, the fastest, easiest way to manage information today.

When MOM™ says she has a software system that can manage information faster than anything else on the market, believe it.

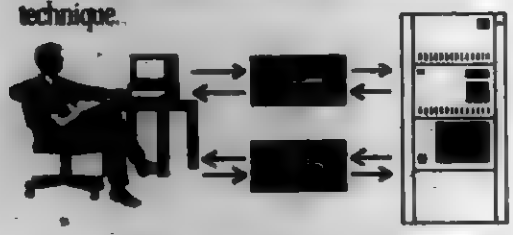
It's called PC/COM. A revolutionary automatic file transfer and management system that opens up a whole new realm of opportunities to PCs and PC-users.

Your mainframe works faster with PC/COM. Your PC gets more file management features.

If you are a mainframe user of TSO, CMS, or CICS, PC/COM will prove invaluable.

MOM says any job worth doing is worth doing fast.

MOM's PC/COM manages information at an incredible speed. And PC/COM will handle just about any file type with its unique binary transfer technique.

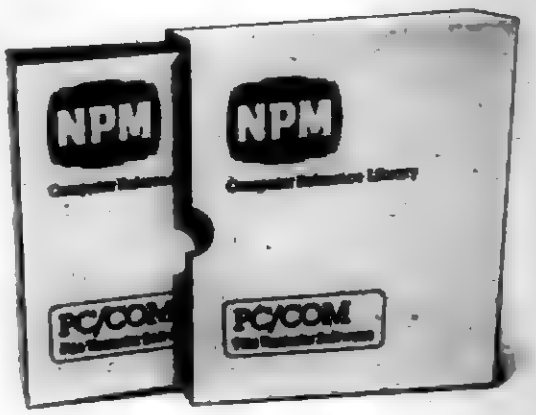


You can even back-up your hard disk on the mainframe. Leave it parked there until you need it. All it takes is the press of a key to get it moving again.

PC/COM is bi-directional, to save time getting information out of the mainframe onto your desk. And vice versa.

Security conscious, private and flexible—that's MOM.

The PC/COM has file access control and security built right in. So only those parts of the mainframe that should be accessed, are.



PC/COM is user-friendly and menu-driven so it's easy to understand. And simple to operate. All the features (and believe you, MOM, there are plenty) are initiated by a single function key.

Call MOM. 1-800-241-1170.

Talk to MOM. Tell her what you have and what you need. Ask her any questions about PC/COM and get good, clear answers.

MOM wants you to understand what you're getting into with PC/COM—and how much you can get out of owning the best, and fastest, file transfer and management system on the market.

The revolutionary PC/COM. Of course, from MOM. Phone 1-800-241-1170 or 404-351-2902.

MOM™

Specialists in Marketing of Micros to Mainframes.

area network standards, has now officially deferred to IEEE 802.

The marketplace

The acceptance of the IEEE 802 standards in the marketplace is assured. As the preceding discussion suggests, the work of the IEEE 802 committee has no competition for standardization. The standards are being adopted within the U.S. and internationally.

Vendors, too, are lining up behind the standard. Fortunately, the CSMA/CD baseband standard is virtually identical to the Ethernet specification. Thus, many Ethernet vendors have announced IEEE 802.3 products and a number of semiconductor houses have announced IEEE 802.3 chips. Token bus broadband is about to follow the same pattern. At least one local-area network vendor (Concord Data Systems) has announced an IEEE 802.4 product. The token ring standard has yet to blossom, but the expected announcement of an IEEE 802.5 product by IBM would change the picture overnight.

What of nonstandard offerings? Many of these can be expected to wither away as the IEEE 802 products become widely available. Two exceptions are likely. The first is the low-cost, twisted-pair local network intended primarily for personal computers. The Corvus Systems, Inc. Omninet is the most prevalent example. Large numbers of these networks are already installed. With the possible exception of the twisted-pair ring, the IEEE 802 standards do not address this marketplace.

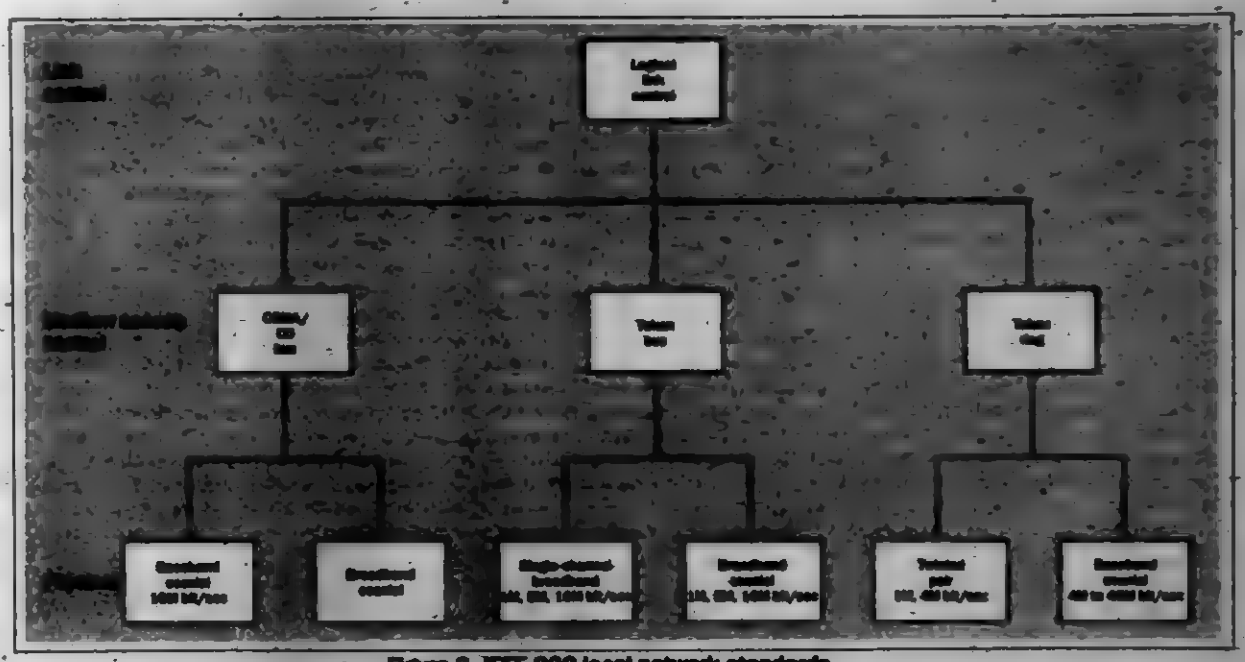

Figure 2. IEEE 802 local network standards

The second exception is from a company called AT&T, which will announce its own local network product shortly. The AT&T offering is totally distinct from all of the various IEEE 802 options and is based on a hybrid circuit and packet-switching technology.

With these exceptions, the world of local networks will rapidly become an IEEE 802 world.

Logical link control

The purpose of any data link control protocol is to provide a reliable communications path between two devices. Typically, data is transmitted in frames, which include control information for error control and flow control.

Because a local network consists of multiple, peer communications stations, the data link control requirement is more complex. The following functions are considered desirable:

Datagram: Some form of connectionless service is needed for efficient support of highly interactive traffic.

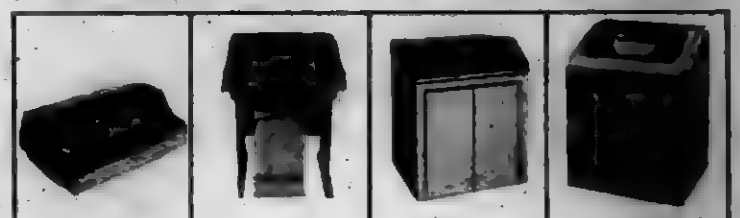
Virtual circuit: A connection-oriented service is also usually needed.

Multiplexing: Generally, a single physical link attaches a station to a local-area network; it should be possible to provide data transfer with multiple end points over that link.

Multicast, broadcast: The link layer should provide a service of sending a message to multiple stations or all stations.

Both the virtual circuit and multiplexing capabilities can be supported with the concept of the service access point (SAP). Figure 3 shows

MTI leases IBM compatible line printers to give you higher performance at lower cost.



B-300	B-600	B-1000	BP-1500
300 LPM	600 LPM	1000 LPM	1500 LPM
1 yr. lease w/service $555 mo.	1 yr. lease w/service $686 mo.	1 yr. lease w/service $1004 mo.	1 yr. lease w/service $1516 mo.

MTI guarantees the compatibility and reliability of Dataproducts printers we interface with your IBM system

Compare MTI's one year lease price which includes manufacturer-approved service. You'll enjoy trouble-free printing with these fine line printers. Dataproducts is the standard of the industry, and this group includes desktop, pedestal-mounted, and soundproofed cabinet models.

MTI is an authorized Dataproducts distributor, so we can have the Dataproducts printer of your choice with the proper interface enhancing your IBM system sooner than you think.

Whether you lease, buy or rent our equipment, you'll find MTI is the one source for all the terminals, peripherals, systems, applications expertise and service you'll ever need. At good prices. Call us.

Table 1. Logical link control primitives

three stations attached to a local network. Each station has an address.

Further, the link layer supports multiple SAPs, each with its own address. The link layer provides communications between SAPs.

Assume that a process or application X in station A wishes to send a message to a process in station C. X may be a report generator program in minicomputer A. C may be a printer and a simple printer driver. X attaches itself to SAP 1 and requests a connection to station C, SAP 1 (station C may have only one SAP if it is a single printer).

Station A's link layer then sends to the local-area network a "connection-request" frame, which includes the source address (A,1), the destination address (C,1) and some control bits indicating that this is a connection request.

The network delivers this frame to C, which, if it is free, returns a "connection-accepted" frame. Henceforth, all data from X will be assembled into a frame by A's LLC, which includes source (A,1) and destination (C,1) addresses.

Incoming frames addressed to (A,1) will be rejected unless they are from (C,1); these might be acknowledgment frames, for example. Similarly, station C's printer is declared busy, and C will only accept frames from (A,1).

Thus a connection-oriented service is provided. At the same time, process Y could attach to (A,2) and exchange data with (B,1). This is an example of multiplexing. In addition, various other processes in A could use (A,3) to send datagrams to various destinations.

IEEE 802 LLC specification

LLC provides two services:

Unacknowledged connectionless service: This is a datagram service that simply allows for sending and receiving frames. It supports point-to-point, multipoint and broadcast.

Connection-oriented service: This provides a virtual-circuit-style connection between service access points. It provides flow control, sequencing and error recovery.

These services are specified in terms of primitives that can be viewed as commands or procedure calls with parameters. Table 1 summarizes the LLC primitives.

The unacknowledged connectionless service provides for only two primitives across the interface between the next highest layer and LLC (not counting management service primitives). L-DATA.request is used to pass a frame to LLC for transmission. L-DATA.indication is used to pass a frame up from LLC upon reception.

The connection-oriented service includes L-DATA-CONNECT.request and L-DATA-CONNECT.indication, with meanings analogous to those above, plus L-DATA-CONNECT.confirm, which conveys the result (acknowledged, failure) of the previous associated L-DATA-CONNECT.request. In addition, a station, through an SAP, must be able to establish and tear down a connection and receive an acknowledgment of this action from the remote SAP. Finally, link resetting and flow control are provided.

The LLC frame consists of four fields, as shown in Figure 4. Unlike most link control formats, LLC requires both source and destination addresses to identify the two peer communicating entities. The source and destination are uniquely identified by a (node, SAP) pair. However, the node address is also used by MAC and is included in the outer MAC frame.

The LLC protocol is very similar to High-Level Data Link Control (HDLC). The format of the control field is identical to that of HDLC and the functioning is the same, with three exceptions:

- LLC makes use only of the asynchronous balanced mode of operation and does not employ HDLC's normal response mode or asynchronous response mode. This mode is used to support connection-oriented service. The set asynchronous balanced mode (SABM) command is used to establish a connection, and disconnect (DISC) is used to terminate the connection.
- LCC supports a connectionless (datagram) service by using the unnumbered information (UI) frame.
- LLC permits multiplexing by the use of SAPs.

CSMA/CD

The simplest form of medium access control adopted for IEEE 802 is CSMA/CD. This technique was popularized by Ethernet, which is a baseband local network developed in its original version by Xerox Corp. and then in its second version jointly by Xerox with Digital Equipment Corp. and Intel Corp. A broadband CSMA/CD was pioneered by Mitre Corp.

We begin by looking at a simpler version known as CSMA (carrier sense multiple access). With this

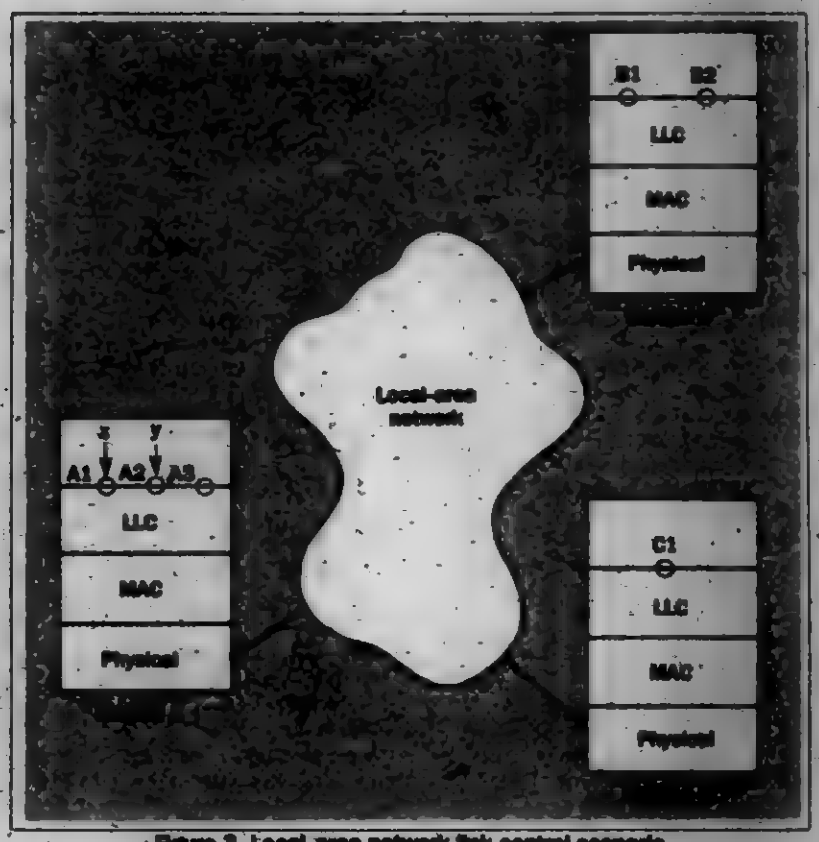

Figure 3. Local-area network link control scenario

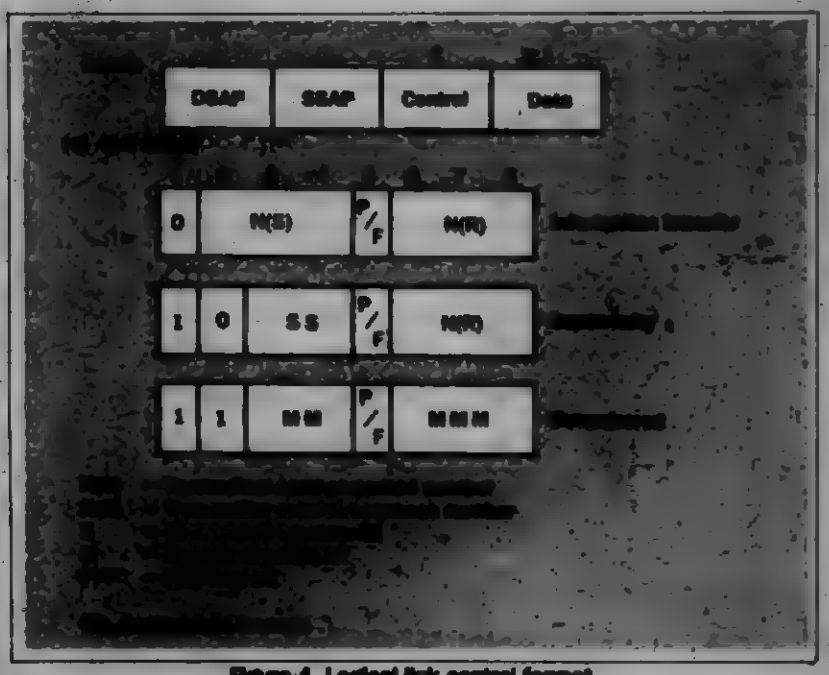

Figure 4. Logical link control format

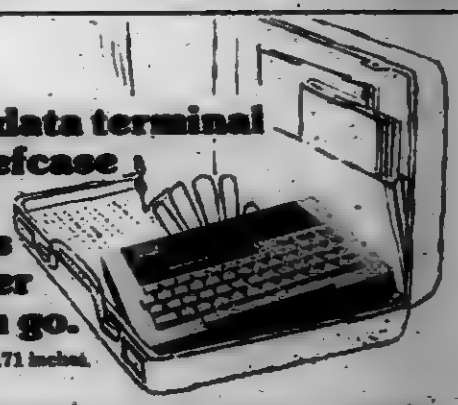
scheme, a station wishing to transmit first listens to the medium to determine if another transmission is in progress. If the medium is idle, the station may transmit. Now, it may happen that two or more stations attempt to transmit at about the same time. If this happens, there will be a collision; the data from both transmissions will be garbled and will not be received successfully. To account for this, a station waits a reasonable amount of time after transmitting for an acknowledgment. If there is no acknowledgment, the station assumes that a collision has occurred and retransmits.

With CSMA, an algorithm is needed to specify what a station should do if the medium is found to be busy. Three approaches are shown in Figure 5. One algorithm is nonpersistent CSMA. A station wishing to transmit listens to the medium and obeys the following rules:

1. If the medium is idle, transmit.
2. If the medium is busy, wait an amount of time drawn from a probability distribution (the retransmission delay) and repeat step 1.

The use of random retransmission times reduces the probability of collisions. The drawback is that even if several stations have a frame to send, there is likely to be some wasted idle time following a prior transmission.

To avoid channel idle time, the 1-persistent protocol can be used. A station wishing to transmit listens to the medium and obeys the following rules:



Slip TI's new data terminal into your briefcase and you'll be able to access your computer wherever you go.

Dimensions: 8.46 x 11.73 x 2.71 inches.
Weight: 5.9 lbs.

Lease the TI707 portable from MTI for $45/month including maintenance.

The Silent 700* Model 707 portable data terminal is ideal for electronic mail applications, data base usage, real estate multiple listing printouts, and much more. The built-in Bell 103 compatible modem lets you access your computer from the nearest telephone jack. With the optional acoustic coupler and battery pack, you can even talk to your computer from a pay phone. The TI 707 features 30 cps matrix printing with true upper and lower case characters.

MTI is an authorized distributor of Texas Instruments' full line of portable terminals, matrix printers and Professional Computers. Whether you buy, lease or rent our equipment, you'll find MTI is the one source for all the terminals, peripherals, systems, applications expertise and service you'll ever need. At great prices. Dataproducts Daisywheel Printers

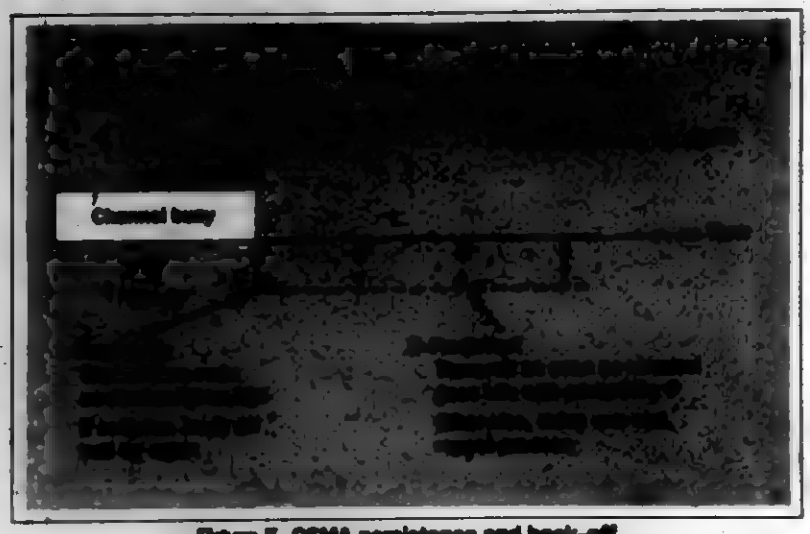

Figure 5. CSMA persistence and back-off

1. If the medium is idle, transmit.
2. If the medium is busy, continue to listen until the channel is sensed idle, then transmit immediately.
3. If there is a collision (determined by a lack of acknowledgment), wait a random amount of time and repeat step 1.

Whereas nonpersistent stations are deferential, 1-persistent stations are selfish. If two or more stations are waiting to transmit, a collision is guaranteed. Things only get sorted out after the collision.

A compromise that attempts to reduce collisions, like nonpersistent, and reduce idle time, like 1-persistent, is p-persistent. The rules are:

1. If the medium is idle, transmit with probability *p*, and delay one time unit with probability (1 - *p*). The time unit is typically equal to the maximum propagation delay.
2. If the medium is busy, continue to listen until the channel is idle and repeat step 1.
3. If transmission is delayed one time unit, repeat step 1.

CSMA has one glaring inefficiency. When two frames collide, the medium remains unusable for the duration of transmission of both damaged frames. For long frames, compared with propagation time, the amount of wasted bandwidth can be considerable. This waste can be reduced if a station continues to listen to the medium while it is transmitting. In that case, these rules can be added to the CSMA rules:

1. If a collision is detected during transmission, immediately cease transmitting the frame and transmit a brief jamming signal to ensure that all stations know there has been a collision.
2. After transmitting the jamming signal, wait a random amount of time, then attempt to transmit again using CSMA.

With this addition, the technique is referred to as CSMA/CD. The technique is illustrated in Figure 6. At time t_0, A begins transmitting a frame addressed to D. At t_1, both B and C are ready to transmit. B senses a transmission and so defers. C, however, is still unaware of A's transmission and begins its own transmission. When A's transmission reaches C(t_2), C detects the collision and ceases transmission. The effect of the collision propagates back to A, where it is detected some time later (t_3), at which time A ceases transmission.

IEEE 802 MAC specification

The IEEE 802 MAC specification follows the general outline described above. One detail worth mentioning is the persistence algorithm. You may be surprised to learn that the IEEE 802 standard specifies the 1-persistent algorithm.

Recall that both nonpersistent and p-persistent have performance problems. In the nonpersistent case, capacity is wasted because the medium will generally remain idle following the end of a transmission, even if there are stations waiting to send. In the p-persistent case, *p* must be set low enough to avoid instability, with the result of sometimes atrocious delays under light load.

The 1-persistent algorithm, which after all means *p* = 1, would seem to be even more unstable than p-persistent because of the greed of the stations. What saves the day is that the wasted time resulting from collisions is mercifully short (if the frames are long relative to propagation delay!); and with random back-off, the two stations involved in a collision are unlikely to collide on their next tries. To ensure that back-off maintains stability, a technique known as binary exponential back-off is used. A station will attempt to transmit repeatedly in the face of repeated collisions, but after each collision, the mean value of the random delay is doubled. After 16 unsuccessful attempts, the station gives up and reports an error.

The beauty of the 1-persistent algorithm with binary exponential back-off is that it is efficient over a wide range of loads. At low loads, 1-persistence guarantees that a station can seize the channel as soon as it

Has your most productive asset been working at half speed?

Look at it this way.

If you had to shade screen glare with one hand, enter data with the other. Hour after hour. Just how efficient would you be?

The fact is, CRT glare takes its toll. On your terminal users. And on department productivity.

But now there's a sensible solution.

Introducing Glare/Guard® anti-glare panels.

Glare/Guard instantly eliminates up to 94 percent of all CRT glare. Resolution is always sharp. And image brightness and clarity are dramatically enhanced—even under bright, fluorescent lighting.

Without anti-glare panel | Etched panel | Glare/Guard

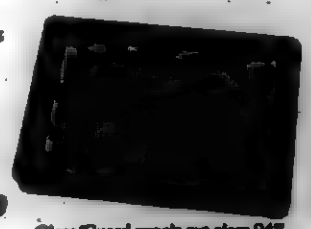
The result? No screen washout.

Glare/Guard's secret is HEA®—a special High-Efficiency Antireflection coating we applied to the windows of NASA's Space Shuttle. And only Glare/Guard has it.

Glare/Guard's durable, laminated-glass design lasts indefinitely. It quickly retrofits to virtually every leading display terminal—no tools required. Its smooth surface is easily cleaned. And Glare/Guard sells for $99, regardless of display size.

Of course, there are less expensive anti-glare products available. But the nylon strands of mesh screens cause fuzzy images. While etched panels merely spread glare around and blur resolution.

Only Glare/Guard does exactly what an anti-glare panel is supposed to do. And that's getting your terminal user's attention out of the glare, and back onto the screen.



Glare/Guard panels cut glare 94%.

Call 800-447-4700 for free brochure.

Glare/Guard anti-glare panels are another quality product manufactured by OCLI. Just call us toll free and we'll send your free brochure, including our helpful sizing guide. Or write Glare/Guard, OCLI, Dept. 109D, 2789 Northpoint Parkway, Santa Rosa, CA 95407-7397.

OCLI

Better yet, place a trial order with your dealer and install Glare/Guard panels on your busiest terminals. You'll see the difference, instantly.

Glare/Guard® and HEA® are registered trademarks of OCLI—Optical Coating Laboratory, Inc. ©1983 OCLI—Optical Coating Laboratory, Inc. All rights reserved.

Glare/Guard®

A difference you can see.

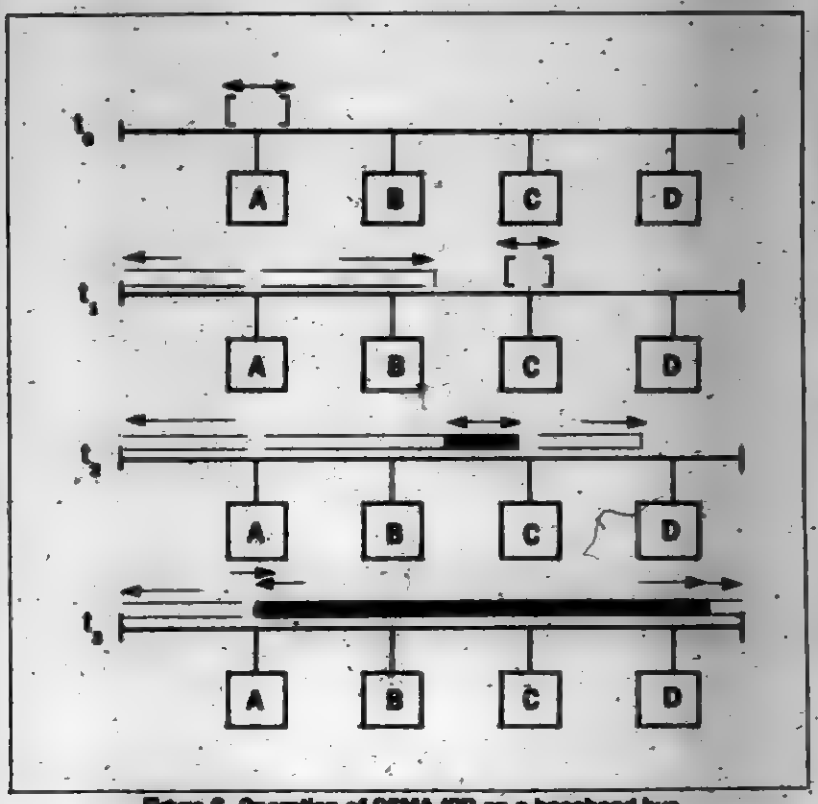


Figure 6. Operation of CSMA/CD on a baseband bus

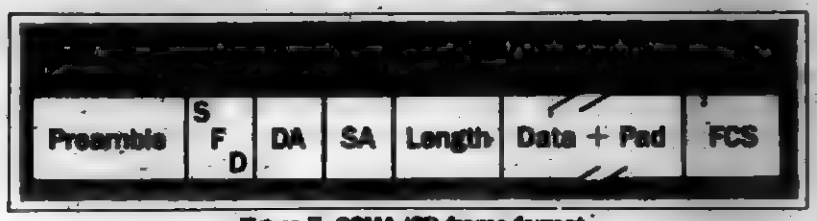

Figure 7. CSMA/CD frame format

goes idle, in contrast to the non- and p-persistent schemes. At high loads, it is at least as stable as the other techniques. However, one unfortunate effect of the back-off algorithm is that it has a last-in, first-out effect; stations with no or few collisions will have a chance to transmit before stations that have waited longer.

Figure 7 shows the MAC CSMA/CD frame structure. The individual fields are as follows:

Preamble: an eight-byte pattern used by the receiver to establish bit synchronization and then locate the first bit of the frame.

Start frame delimiter (SFD): indicates the start of a frame.

Destination address (DA): specifies the station(s) for which the frame is intended. It may be a unique physical address (one destination transceiver), a multicast-group address (a group of stations) or a global address (all stations on the local network).

Source address (SA): specifies the station that sent the frame.

Length: specifies the number of LLC bytes that follow.

LLC data: field prepared at the LLC level.

Pad: a sequence of bytes added to assure that the frame is long enough for proper CD operation.

Frame check sequence (FCS): a 32-bit cyclic redundancy check value. Based on all fields, starting with destination address.

The CSMA/CD physical layer specification calls for a baseband, 50-ohm coaxial cable. In this context, the term baseband refers to the use of digital signaling, as opposed to the use of a modem and analog signaling.

Digital signals are transmitted using Manchester encoding. This is an encoding technique that ensures at least one voltage transmission per bit time. A collision is detected if a larger-than-expected voltage swing is observed.

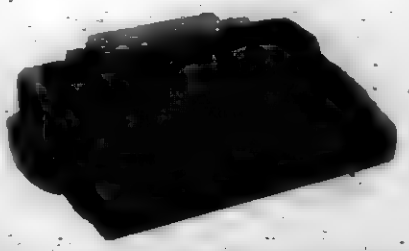
Several broadband schemes for CSMA/CD are under consideration. Broadband implies the use of analog signals and will allow multiple channels to be carried simultaneously.

Token bus

Token bus is a relatively new technique for controlling access to a broadcast medium, inspired by the token ring technique discussed later.

For token bus, the stations on the bus or tree form a logical ring; that is, the stations are assigned logical positions in an ordered sequence, with the last member of the sequence followed by the first. Each station knows the identity of the stations preceding and following it. The physical ordering of the stations on the bus is irrelevant and independent of the logical ordering (see Figure 8 on ID/34).

A control packet known as the token regulates the right of access. The token frame contains a destination address. The station receiving the token is granted control of the medium for a specified time. The station may transmit one or more frames and may poll stations and



Lease the Digital LA12-C plain paper portable from MTI for $83/month including maintenance.

We are authorized distributors of Digital's terminals, printers and personal computers.

Digital's Correspondent is the most versatile portable around. It uses any paper, prints multi-part forms, prints up to 132 columns at 150 cps, full ASCII character set plus bit map graphics via a highly legible 9x9 dot matrix. There are five models of this versatile portable with different data communications capabilities. The C model has an integral 300 baud acoustic coupler.

MTI is one of the few Authorized Digital Terminals Distributors, so we can give you the best of two worlds; terminals, based on advanced technology from the industry leader, and the expertise and service from applications specialists.

Whether you buy, rent or lease our equipment, you'll find MTI is the one source for all the terminals, peripherals, systems, applications expertise and service you'll ever need. At good prices. Call us today.

Dataproducts Daisywheel Printers

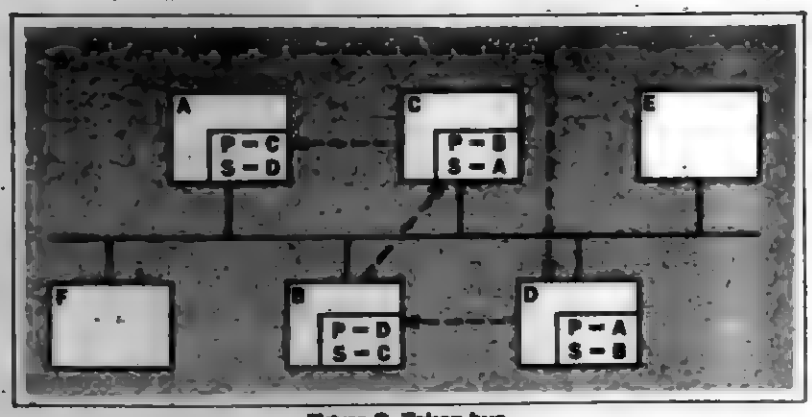

Figure 8. Token bus

receive responses. When the station is done or time has expired, it passes the token on to the next station in logical sequence. This station now has permission to transmit. Hence, steady-state operation consists of alternating data transfer and token transfer phases. In addition, non-token-using stations are allowed on the bus. These stations can only respond to polls or requests for acknowledgment.

This scheme requires considerable maintenance. The following functions, at a minimum, must be performed by one or more stations on the bus:

Ring initialization: When the network is started up, or after the logical ring has broken down, it must be reinitialized. Some cooperative, decentralized algorithm is needed to sort out who goes first, who goes second and so on.

Addition to ring: Periodically, nonparticipating stations must be granted the opportunity to insert themselves in the ring.

Deletion from ring: A station can voluntarily remove itself from the ring by splicing together its predecessor and successor.

Fault management: A number of errors can occur. These include duplicate address (two stations think it is their turn) and broken ring (no station thinks that it is its turn).

Figure 9. Token bus frame format

Token bus specification

The IEEE 802 token bus protocol follows the general principles outlined above. In general, token-passing and data-passing phases alternate.

Figure 9 shows the MAC frame structure for a token bus. The individual fields are as follows:

Preamble: a one-or-more-byte pattern used by receivers to establish bit synchronization and locate the first bit of the frame.

Start delimiter (SD): indicates start of frame.

Frame control (FC): indicates whether this is an LLC data frame. If not, bits in this field control operation of the token bus MAC protocol. An example is a token frame.

Destination address (DA): as with CSMA/CD.

Source address (SA): as with CSMA/CD.

Data unit: field prepared by LLC.

Frame check sequence (FCS): as with CSMA/CD.

End delimiter (ED): indicates end of frame.

The details of the protocol can be grouped into the following categories, which will be considered in turn:

- Addition of a node.
- Deletion of a node.
- Fault management by token holder.
- Ring initialization.

How to contact IEEE 802

The IEEE 802 Project maintained an open-door policy of participation. At any one working group, about 20 to 30 people showed up. Participants came from a variety of backgrounds within communications and marketing. Most worked for a computer vendor or AT&T. The only other major source of participation was the National Bureau of Standards.

Anyone wishing to comment on or question a particular aspect of the proposed standard should write to the chairman of the appropriate working group:

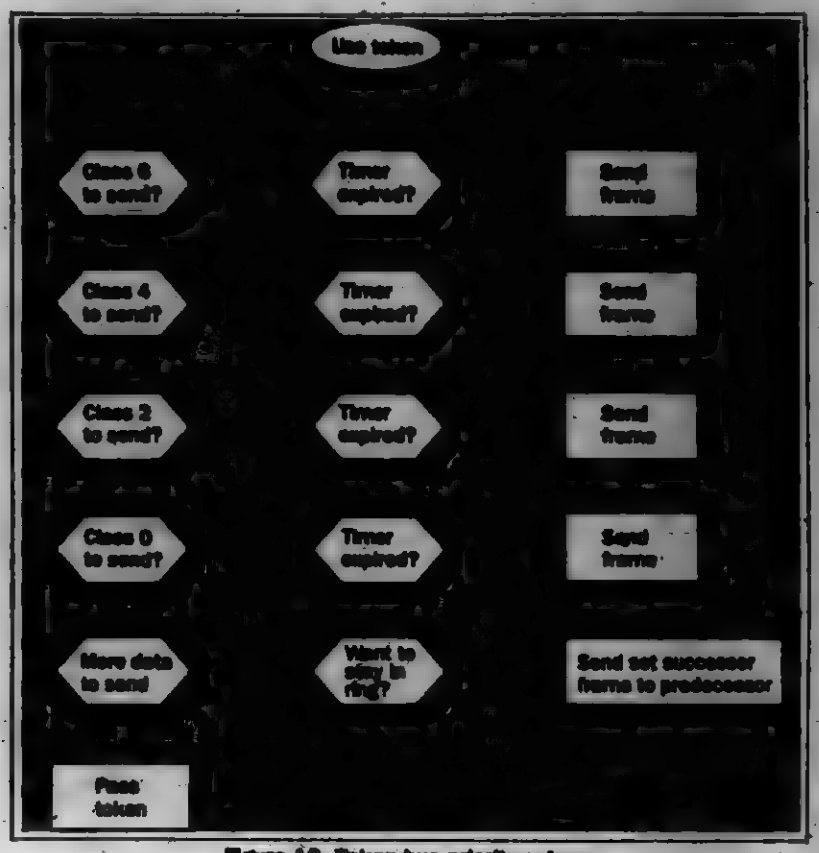

Figure 10. Token bus priority scheme

■ Classes of service.

First, let us consider how a node is added to the ring, using a controlled contention process called *response windows*. Each node in the ring has the responsibility of periodically granting an opportunity for new nodes to enter the ring. While holding the token, the node issues a *solicit-successor* frame, inviting nodes with an address between itself and the next node in logical sequence to demand entrance. The transmitting node then waits for one response window or slot time (equal to twice the end-to-end propagation delay of the medium). Three events can occur:

1. **No response:** Nobody wants in. The token holder transfers the token to its successor as usual.

2. **One response:** One node issues a *set-successor* frame. The token holder sets its successor node to be the requesting node and transmits the token to it. The requester sets its linkages accordingly and proceeds.

3. **Multiple responses:** The token holder will detect a garbled response if more than one node demands entrance. The conflict is resolved by an address-based contention scheme. The token holder transmits a *resolve-contention* frame and waits four demand windows. Each demander can respond in one of these windows based on the first two bits of its address. If a demander hears anything before its window comes up, it refrains from demanding.

If the token holder receives a valid set-successor frame, it is in business. Otherwise, it tries again, and only those nodes that responded the first time are allowed to respond this time, based on the second pair of bits in their address. This process continues until a valid set-successor frame is received, no response is received or a maximum retry count is reached. In the latter two cases, the token holder gives up and passes the token.

Deletion of a node is much simpler. If a node wishes to drop out, it waits until it receives the token, then sends a set-successor frame to its predecessor, instructing it to splice to its successor. If a node fails, it will not pick up the token when the token is passed to it, and this failure will be detected by the token sender, as explained below.

Fault management by the token holder covers a number of contingencies (see Table 2). First, while holding the token, a node may hear a frame indicating that another node has the token. If so, it immediately drops the token by reverting to listener mode. In this way, the number of token holders drops immediately to one or zero, thus overcoming the multiple-token problem (which could be caused by two nodes having the same address). Upon completion of its turn, the token holder will issue a token frame to its successor. The successor should immediately issue a data or token frame. Therefore, after sending a token, the token issuer will listen for one slot time to make sure that its successor is active. This precipitates a sequence of events:

1. If the successor node is active, the token issuer will hear a valid frame and revert to listener mode.

2. If the issuer does not hear a valid frame, it reissues the token to the same successor one more time.

3. After two failures, the issuer assumes that its successor has failed and issues a *who-follows* frame, asking for the identity of the node that follows the failed node. The issuer should get back a set-successor frame from the second node down the line. If so, the issuer adjusts its linkage and issues a token (back to step 1).

4. If the issuing node gets no response to its who-follows frame, it tries again.

5. If the who-follows tactic fails, the node issues a solicit-successor frame with the full address range (that is, every node is invited to respond). If this process works, a two-node ring is established, and life goes on.

6. If two attempts of step 5 fail, the node assumes that a catastrophe has occurred; perhaps the node's receiver has failed. In any case, the node ceases activity and listens to the bus.

Logical ring initialization occurs when one or more stations detect a lack of bus activity of duration longer than a time-out value: The token has been lost. This situation can have a number of causes; perhaps the network has just been powered up or a token-holding station fails. Once its time-out expires, a node will issue a *claim-token* frame. Contending claimants are resolved in a manner similar to the response-window process. Each claimant issues a claim-token frame padded by zero, two, four or six slots based on the first two bits of its address.

After transmission, a claimant listens to the medium and if it hears anything, drops its claim. Otherwise, it tries again, using the second pair of its address bits. The process repeats. With each iteration, only those stations that transmitted the longest on the previous iteration try again, using successive pairs of address bits. When all address bits have been used, a node that succeeds on the last iteration considers itself the token holder. The ring can now be rebuilt by the response window process described previously.

As an option, a token bus system can include classes of service that provide a mechanism of prioritizing access to the bus. Four classes of service are defined, in descending order of priority: 6, 4, 2, 0. Any station may have data in one or more of these classes to send. The object is to allocate network bandwidth to the higher priority frames and only send lower priority frames when there is sufficient bandwidth. To explain, let us define the following variables:

■ THT = token holding time: the maximum time that a station can hold the token to transmit class 6 (synchronous) data.

■ TRT4 = token rotation time for class 4: maximum time that a token can take to circulate and still permit class 4 transmission.

■ TRT2 = token rotation time for class 2: as above.

Table 2. Token bus error handling

MAKE YOUR VAX® DO WINDOWS

Micro-to-mainframe:

Before you settle for solution, ask a few serious

Choosing a micro-to-mainframe communications system is no game.

If you make the wrong choice, the consequences can be very expensive.

So before you toy around with "easy" solutions, do yourself a favor and ask some serious questions.

You might want to start with these:

Will this product support full IBM Terminal Emulation?

Make sure the system you choose offers *full* protocol emulation. It should be able to emulate remote batch and interactive IBM terminals and terminal systems.

Does the company offer a variety of products to solve my problem?

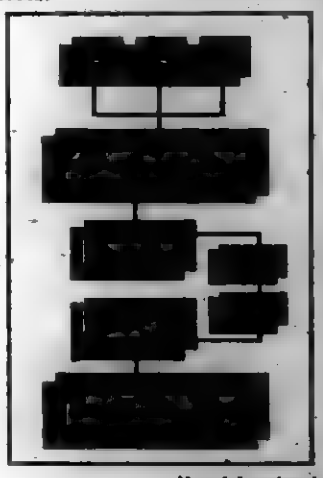
The manufacturer you select should be able to handle *any* operating environment. You should have your choice of stand-alone front-end processors, IBM PC or XT boards, or an OEM board. And make sure the products will run on the most popular operating systems, including CP/M, MS-DOS and UNIX.

Can I get fast answers to my questions?

Insist on toll-free access to qualified service personnel before and *after* the sale. A Product Support Group should be available during your normal business day.

What if I need a quick analysis of a problem?

If you run into a problem, you shouldn't have to sit through a lengthy question-and-answer session over the phone. Ask if the manufacturer has a Communications Test Center that allows for product testing over public phone lines. And find out if the product has internal diagnostics that point out problem areas right on the screen.



Suppose something goes wrong with the unit?

Be sure the company offers a service plan that includes a 30 day money-back guarantee and a 12 month warranty that includes a free replacement unit.

a simplistic questions.

What about future product development?

It's not enough for a company to solve your communications problems today. Ask about their commitment to R&D. Are they working on products you're going to need soon? If not, you might want to consider someone who is.

Who am I dealing with anyway?

In a market as volatile as this one, you need some reassurance that the people you buy from will be around to back up their products. Ask how long they've been in business. The longer, the better.

How much is all this going to cost?

There are lots of micro-to-mainframe solutions with lots of price tags. But here's a point of reference for you:

Our own DataTalker™ product line will give you all the capabilities and services we've just described for as little as $695. Complete.

Granted, this isn't all the information you'll need to choose the right micro-to-mainframe solution. But it's a good start.

If you'd like to know more—and there certainly is more to tell—contact our Marketing Support Group at 1-800-321-7785.

We'll make sure you get the answers you need. And we won't play games.

DataTalker™

By Winterhalter, Incorporated

Winterhalter, Incorporated has been providing data communications solutions to major manufacturers of microcomputers and word processors since 1978. Our Datatalker front-end processors and PC boards are used by companies around the world, from start-up manufacturers to the Fortune 1000.

NASDAQ SYMBOL WNTR

The New WY1000 Microcomputer

BUILDING BLOCKS

Powerful, Affordable, Expandable

The WY1000 stacks up to be a lot of machine from a few simple pieces. By adding the WY1000 microcomputer to the good-looking, ergonomic WY50 display terminal, we created the most exciting concept in desktop workstations on the market today.

We also added sophisticated high resolution graphics, suitable for the most demanding applications.

Plus, we added color capability, when used with our color terminal.

And on top of that, we added a Winchester Disk Drive option providing an additional 10 megabytes of storage.

FEATURES:

- **80186 16 Bit 8 MHz Processor**
- **128KB to 768KB RAM Memory**
- **Two Floppy Disk Drives (725 KB)**
- **Optional 10 MB Winchester Drive**
- **RS232 & RS422 Serial Ports**
- **Optional Graphics/Color Graphics**
- **Networking Capability**
- **CP/M™, MS-DOS™ Compatible**
- **Priced from only $1995**

Best of all, we priced the WY1000 from only $1995. It all adds up to a system builder's dream.

For a complete brochure on the WY1000 contact Wyse Technology toll free at 800/421-1058.

WYSE

Make the Wyse Decision.

THT0 = token rotation time for class 0: as above.

When a station receives the token, it can transmit classes of data according to the following rules (see Figure 10 on ID/35):

1. It may transmit class 6 data for a time THT. Hence, for an *n*-station ring, during one circulation of the token, the maximum amount of time available for class 6 transmission is *n* x THT.

2. After transmitting class 6 data, or if there was no class 6 data to transmit, it may transmit class 4 data only if the amount of time for the last circulation of the token (including any class 6 data just sent) is less than TRT4.

3. The station may next send class 2 data only if the amount of time for the last circulation of the token (including any class 6 and 4 data just sent) is less than TRT2.

4. The station may next send class 0 data only if the amount of time for the last circulation of the token (including any class 6, 4 and 2 data just sent) is less than TRT0.

This scheme, within limits, gives preference to frames of higher priority. More definitively, it guarantees that class 6 data may have a certain portion of the bandwidth.

Two cases are possible. If *n* x THT is greater than MAX[TRT4, TRT2, TRT0], the maximum possible token circulation time is *n* x THT, and class 6 data may occupy the entire cycle to the exclusion of other classes. If *n* x THT is less than MAX[TRT4, TRT2, TRT0], the maximum circulation time is MAX[TRT4, TRT2, TRT0], and class 6 data is guaranteed *n* x THT amount of that time.

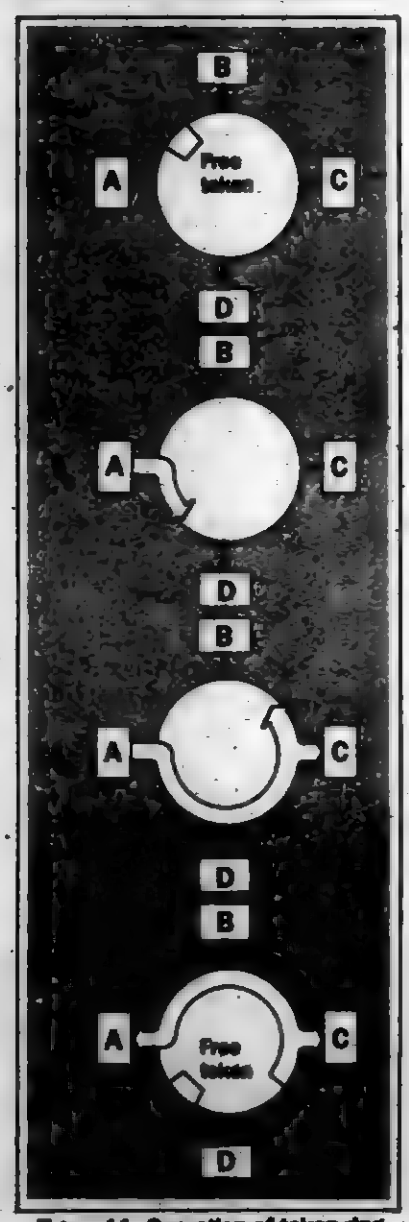

Figure 11. Operation of token ring

Token bus physical layer specification

For token bus, three physical layer specifications are provided as options. All use 75-ohm CATV coaxial cable, and all use modems and analog signaling. This contrasts with the CSMA/CD baseband specification, which uses digital signaling on a special 50-ohm cable.

The simplest and least expensive option uses a form of frequency-shift keying (FSK) and operates at 1M bit/sec. This scheme is known as "single-channel broadband" to indicate that only one channel of signal can be carried; it is not possible to use frequency-division multiplexing. The second option is also single-channel broadband, using FSK at either 5M or 10M bit/sec. In this case, the electronic specifications are such that this option is easily upgradable to the final and most expensive option.

This final option is a full broadband system, which can carry multiple data channels, as well as video channels, simultaneously. Three data rates are provided: 1M bit/sec, which occupies a 1.5-MHz channel; 5M bit/sec, occupying a 6-MHz channel; and 10M bit/sec, occupying a 12-MHz channel.

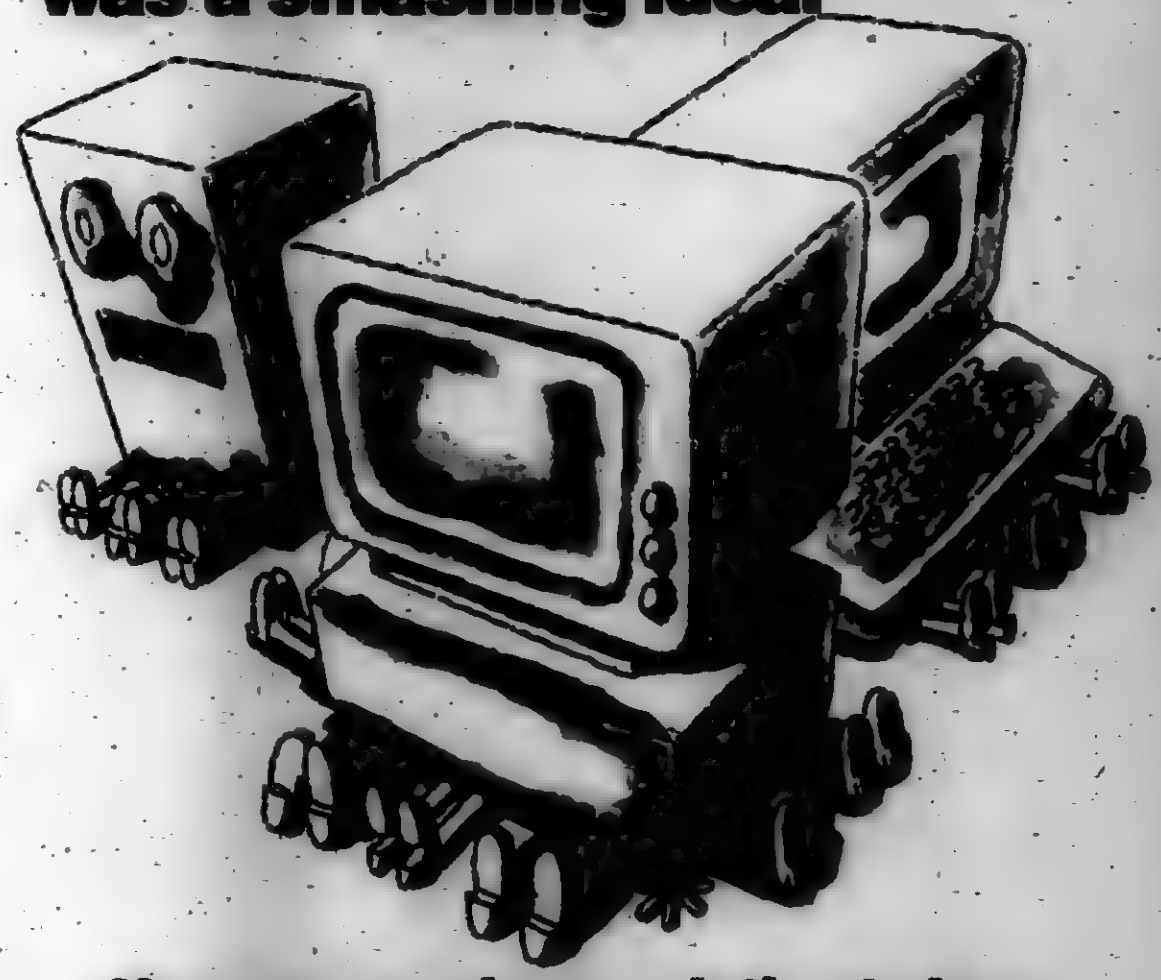
Token ring

The token ring technique is the only medium access control protocol specified for the ring topology. The token ring technique is based on the use of a single token that circulates around the ring when all stations are idle (see Figure 11). A station wishing to transmit must wait until it detects a token passing by. It then changes the token from "free token" to "busy token." The station then transmits a frame immediately following the busy token.

There is now no free token on the ring, so other stations wishing to transmit must wait. The frame on the ring will make a round trip and be purged by the transmitting station. The transmitting station will insert a new free token on the ring when the station has completed transmission of its frame and the busy token has returned to the station.

If the bit length of the ring is less than the frame length, the first condition implies the second. If not, a

Providing your employees with the latest office technology was a smashing idea.



Now you need one solution to keep them on top of it all.

With all the subtlety of a bomb, technology has arrived in your organization. And its effect on productivity can be devastating. Even your most skilled, most motivated employees may be hard-pressed to keep up.

The solution is comprehensive, continuous education and training. And DELTAK, the world leader in training programs and services, can help.

For your DP professionals, there's a wide range of job-specific multimedia and computer-based skills courses. For managers and end users, we offer micro-courseware and video briefings covering critical business issues.

And to complete your expanding training needs, DELTAK now provides comprehensive consulting, professional classroom instruction and major city workshops.

So call today and find out how DELTAK can help your people stay on top of some very pressing problems.

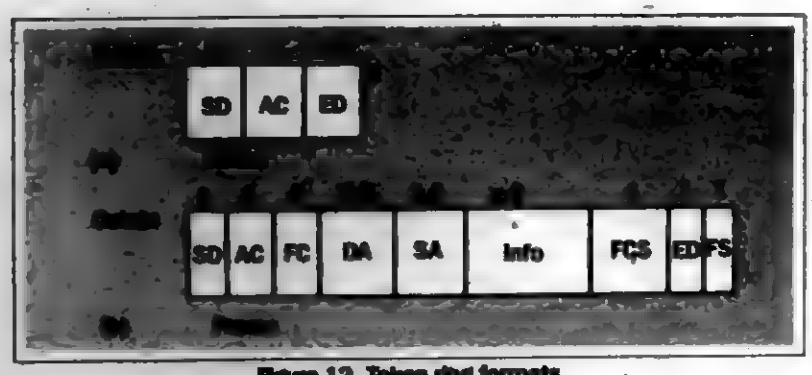

Figure 12. Token ring formats

station could release a free token after it has finished transmitting but before it receives its own busy token; the second condition is not strictly necessary.

In any case, the use of a token guarantees that only one station at a time may transmit.

When a transmitting station releases a new free token, the next station downstream with data to send will be able to seize the token and transmit.

Several implications of the token ring technique can be mentioned. Note that under lightly loaded conditions, there is some inefficiency because a station must wait for the token to come around before transmitting. However, under heavy loads, which is where it matters, the ring functions in a round-robin fashion, which is both efficient and fair. To see how this process works, refer to Figure 11.

Note that after station A transmits, it releases a token. The first station with an opportunity to transmit is D.

If D transmits, it then releases a token, and C has the next opportunity and so on. Finally, the ring must be long enough to hold the token. If stations are temporarily bypassed, their delay may need to be supplied artificially.

Token ring specification

The IEEE 802 token ring specification is a refinement of the scheme just outlined. The key elements are as follows:

1. **Single-token protocol:** A station that has completed transmission will not issue a new token until the busy token returns. This procedure is not as efficient, for small frames, as a multiple-token strategy of issuing a free token at the end of a frame. However, the single-token system simplifies priority and error-recovery functions.

2. **Priority bits:** These indicate the priority of a token and, therefore, which stations are allowed to use the token. In a multiple-priority scheme, priorities may be set by station or by message.

3. **Monitor bit:** It may be used if a central ring monitor is employed.

4. **Reservation indicators:** They may be used to allow stations with high-priority messages to indicate in a frame that the next token be issued at the requested priority.

5. **Token-holding timer:** Started at the beginning of data transfer, it controls the length of time a station may occupy the medium before transmitting a token.

6. **Acknowledgment bits:** There are three: error detected (E), address recognized (A) and frame copied (C). These are reset to 0 by the transmitting station. Any station may set the E bit. Addressed stations may set the A and C bits.

Figure 12 shows the two frame formats for token ring. The individual fields are as follows:

Starting delimiter (SD): a unique eight-bit pattern used to start each frame.

Access control (AC): has the format "PPPTMRRR," where PPP and RRR are three-bit priority and reservation variables, M is the monitor bit and T indicates whether this is a token or data frame. In the case of a token frame, the only additional field is ED.

Frame control (FC): indicates whether this is an LLC data frame. If not, bits in this field control operation of the token ring MAC protocol.

Destination address (DA): as in CSMA/CD and token bus.

Source address (SA): as in CSMA/CD and token bus.

LLC: as in CSMA/CD and token bus.

FCS: as in CSMA/CD and token bus.

Ending delimiter (ED): contains the error detection (E) bit and the intermediate frame (I) bit. The I bit is used to indicate that this is a frame other than the final one of a multiple-frame transmission.

Frame status (FS): contains the address recognized (A) and frame copied (C) bits.

Let us first consider the operation of the ring when only a single priority is used. In this case, the priority and reservation bits are not used. A station wishing to transmit waits until a free token goes by, as indicated by a token bit of 0 in the AC field. The station seizes the token by setting the token bit to 1. It then transmits one or more frames, continuing until either its output is exhausted or its token-holding timer expires. After the busy token returns, the station transmits a free token.

Stations in the receive mode listen

to the ring. Each station can check passing frames for errors and set the E bit if an error is detected. If a station detects its own address, it sets the A bit to 1; it may also copy the frame, setting the C bit to 1. This allows the originating station to differentiate three conditions: 1) station nonexistent/nonactive, 2) station exists but frame not copied and 3) frame copied.

The foregoing operation can be supplemented by a multiple-priority scheme. For example, bridges could be given higher priority than ordinary stations. The 802 specification provides three bits for eight levels of priority. For clarity, let us designate three values: P_m = priority of message to be transmitted by station; P_r = received priority; and R_r = received reservation. The scheme works as follows:

1. A station wishing to transmit must wait for a free token with $P_r \leq P_m$.

2. While waiting, a station may reserve a token at its priority level (P_m). If a busy token goes by, it may set the reservation field to its priority ($R_r \leftarrow P_m$) if the reservation field is less than its priority ($R_r < P_m$). If a free token goes by, it may set the reservation field to its priority ($R_r \leftarrow P_m$) if $R_r < P_m$ and $P_m < P_r$. This has the effect of preempting any lower priority reservations.

3. When a station seizes a token, it sets the token bit to 1, the reservation field to 0 and leaves the priority field unchanged.

4. Following transmission, a station issues a new token with the priority set to the maximum of P_r, R_r and P_m and a reservation set to the maximum of R_r and P_m.

The effect of the above steps is to sort out competing claims and allow the waiting transmission of highest priority to seize the token as soon as possible. A moment's reflection reveals that, as is, the algorithm has a ratchet effect on priority, driving it to the highest used level and keeping it there.

To avoid this situation, two stacks are maintained, one for reservations and one for priorities. In essence, each station is responsible for assuring that no token circulates indefinitely because its priority is too high. By remembering the priority of earlier transmissions, a station can detect this condition and downgrade the priority to a previous, lower priority or reservation.

Summarizing the priority algorithm

We are now in a position to summarize the priority algorithm. A station having a higher priority than the current busy token can reserve the next free token for its priority level as the busy token passes by. When the current transmitting station is finished, it issues a free token at that higher priority. Stations of lower priority cannot seize the token, so it passes to the requesting station or an intermediate station of equal or higher priority with data to send.

The station that upgraded the priority level is responsible for downgrading it to its former level when all higher priority stations are finished. When the station sees a free token at the higher priority, it can assume that there is no more higher priority traffic waiting, and it downgrades the token before passing it on.

To overcome various error situations, such as no token circulating and persistent busy token, one station is designated as active token monitor. The monitor detects the lost-token condition by using a timeout greater than the time required for the longest frame to completely traverse the ring. To recover, the monitor purges the ring of any residual data and issues a free token. To detect a circulating busy token, the monitor sets the monitor bit to 1 on any passing busy token. If it sees a busy token with a bit already set, it knows that the transmitting station failed to purge its frame. The monitor changes the busy token to a free token.

Other stations on the ring have the role of passive monitor. Their primary job is to detect failure of the active monitor and assume that role. A contention-resolution algorithm is used to determine which station takes over.

The physical layer specification for the token ring remains to be fully worked out. The following options are expected:

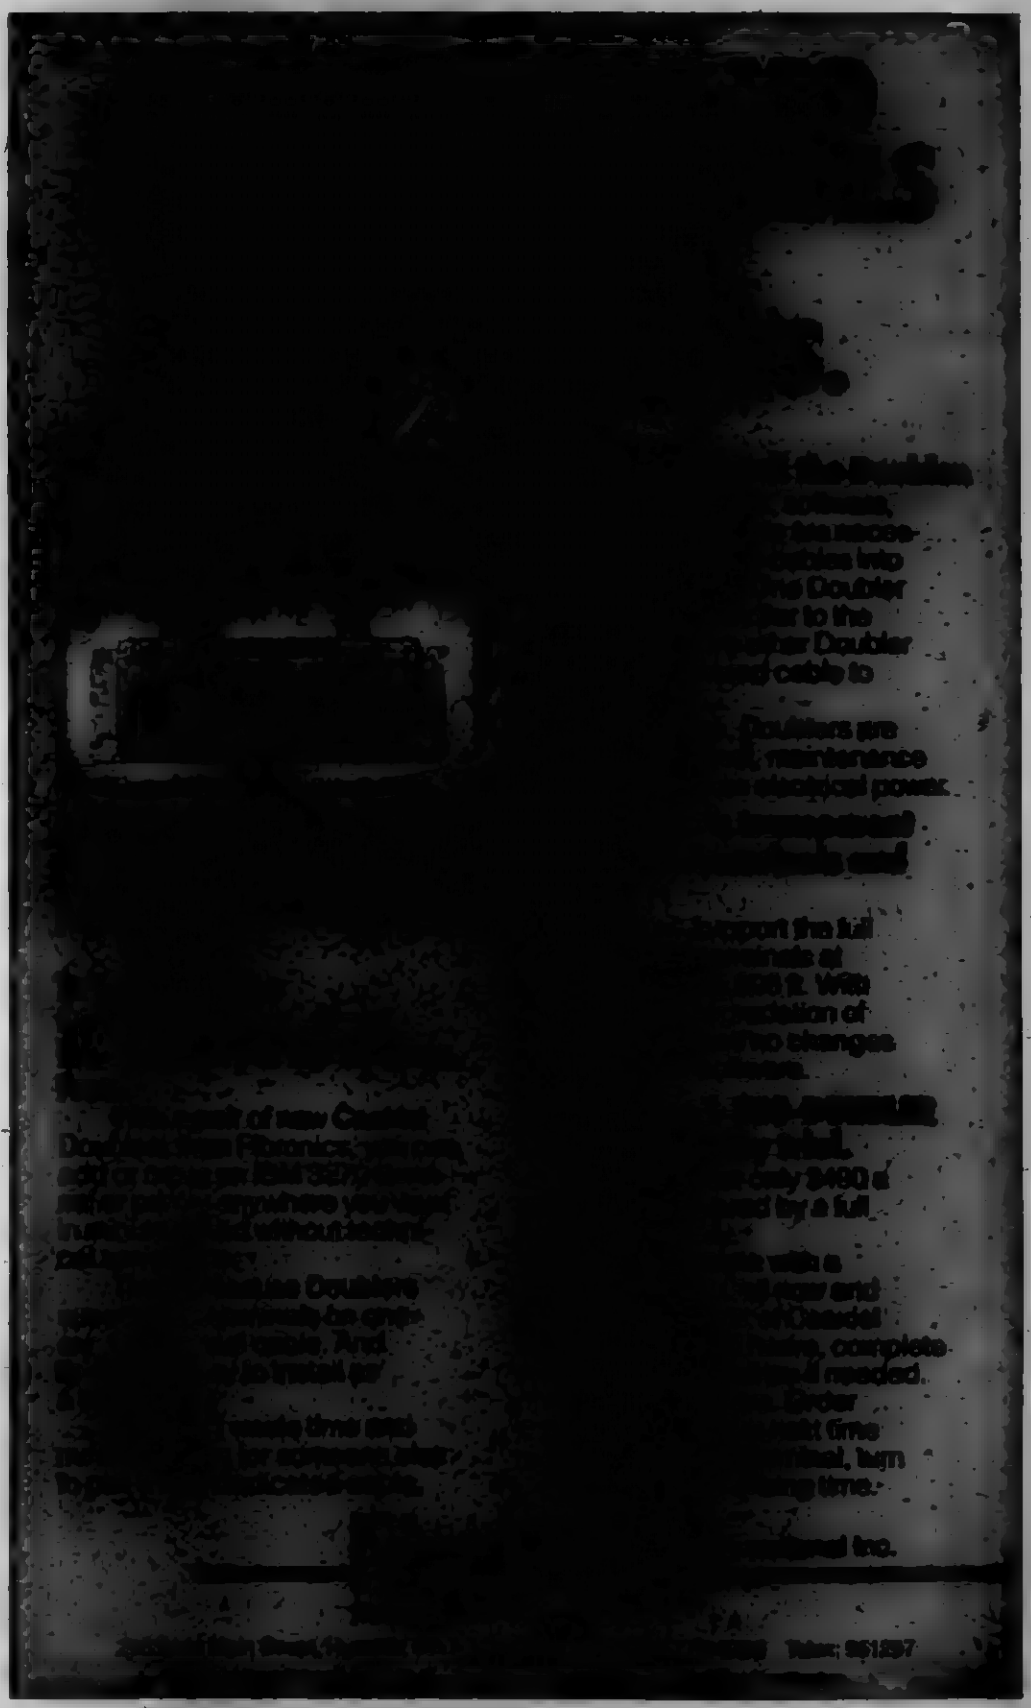
- A lower speed (1M to 4M bit/sec) ring will use a 150-ohm shielded twisted pair.
- Higher speed (4M to 40M bit/sec) may be provided with baseband coaxial cable.
- It is expected that a fiber-optic ring will be defined at some later date.

In many ways, the work of the IEEE 802 committee has been a resounding success. The committee has completed or is close to completing a full set of standards, which has received widespread acceptance. If there has been a failure, it is that the group did not come up with a single standard for local networks. This failure, however, reflects the diversity of the technology rather than any inadequacy within the committee.

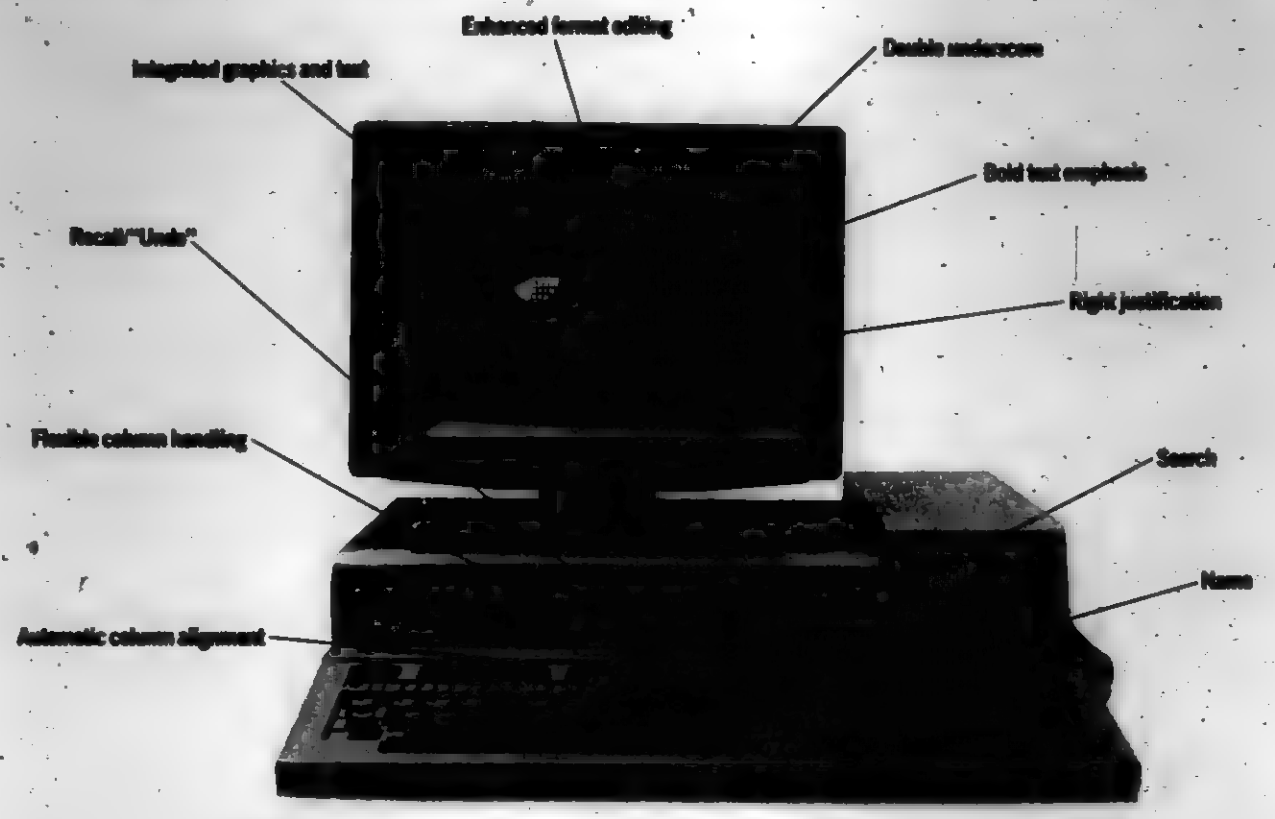
About the author

Dr. William Stallings lectures and writes on data communications subjects. He is the author of Local Networks: An Introduction *(Macmillan, 1984), upon which this article is based.*

Stallings teaches an IEEE 802 course under the auspices of Omnicom, Inc. of Vienna, Va. He is senior communications consultant with Honeywell Information Systems, Inc. in McLean, Va.



Wang Word Processing Plus.



We couldn't leave well enough alone.

For years, word processing from Wang has been the world's standard.

Now it's the only standard.

Because feature for feature, there isn't another word processing software product that even comes close.

Not IBM. Not anyone.

From integrated text and graphics to split-screen editing, Word Processing Plus not only does more, it does it faster and easier.

WP Plus is available on Wang VS, OIS, and Alliance® systems.

And it's easy to convert existing Wang WP documents to WP Plus.

Word Processing Plus.

Once again, the last word in words is Wang.

For a demonstration of Wang WP Plus, call 1-800-225-9264. Or write to: Wang Laboratories, Inc., Business Executive Center, One Industrial Avenue, Lowell, MA 01851.

IN DEPTH

Technostress

By Craig Brod

It took a thousand years for humanity to incorporate machines in its psyche. It took an era for humanists to call attention to the new psychological problems machines pose. We can no longer wait for hindsight. Technostress is already a reality. We must learn to come to grips with it now.

Jacques Ellul, in *The Technological Society*, pointed out that the impact of new technology on our collective psyche is more forceful now than during the industrial era. Not only has technology become the environment, a ubiquitous part of our lives requiring mastery for survival, but it possesses a power of its own. Machines have become so interconnected that one device necessitates another, which in turn generates the need for more machines and newer applications to keep pace. More computers mean more computer systems and more computerized procedures.

According to Ellul, human character is bound by the computer. We find ourselves confused, overwhelmed and culturally at sea. Our ability to exercise free choice and pursue meaningful lives is made difficult.

Questions of values and free choice are being explored within the technical community itself. Joseph Weizenbaum, professor of computer science at MIT, has written extensively on how the role advocated for the computer by many social scientists and computer professionals intensifies alienation.

Weizenbaum maintains that the espoused benefits of the "information society" are, in fact, questionable. Overreliance on computer systems, in his view, is undercutting people's ability to perceive and evaluate their own lives; the computer reinforces "a kind of pragmatic positivism bordering on scientism."

This approach to the world may

ultimately reduce people's ability to think creatively by not allowing them to see alternatives to their problems. Weizenbaum fears that as people model themselves on the computer, their self-images as dynamic, feeling beings will be eclipsed by the image of the computer as the universal hero.

Although there is no fixed bundle of characteristics we can refer to as human nature, there is a point beyond which we become nonhuman. At this point, we no longer strive to realize our potential to become feeling, sentient beings. The elegance of being human is reflected in our gift of being able to articulate the finest shades of meaning and feeling. Most of us have an inner desire to blossom, to be creative, to expand our horizons and our bonds with others.

Joann exhibits the classic behavior of the technocentered individual. Her relationship to the computer is determining her relationship to all else, and the computer comes first. She has reordered her priorities, and from her perspective, it probably appears to be a good arrangement.

When we make an all-out effort to adapt to new technology and to become, in effect, high-performance machines ourselves, we frustrate those inner strivings. In so doing, we stunt our most valuable human qualities. In recalling those experiences in life we all most prize — occasions when we express strong emotions, appreciate a beautiful work of art, share a touching moment — the force of those experiences leave us no room to doubt that we are people, not machines.

The central question we must try to face is this: Given our tremendous potential as human beings, how well are we living up to our promise? It is claimed that the computer is the greatest extension of human experience and culture thus far — a tool to do our bidding — but this assessment does not match the experience of how our use of computers is affecting our culture.

Most warnings about technology's effect on human character have been couched in general, societal terms. Social critics have tended not to venture from the speculative to the concrete by examining the individual lives of people for whom the computer is their culture. This broad-brush approach is highly useful, but it is incomplete. As Arthur Koestler once commented, "Facts don't bleed. People do."

The computer has spread so far in so short a time that already evidence of how people's characters are being tansformed is all around us. In some cases, the change is subtle; in others, it is dramatic. The latter cases — instances where people have become technocentered — help illuminate what threatens to become the normal behavior of our time.

Technocentered living

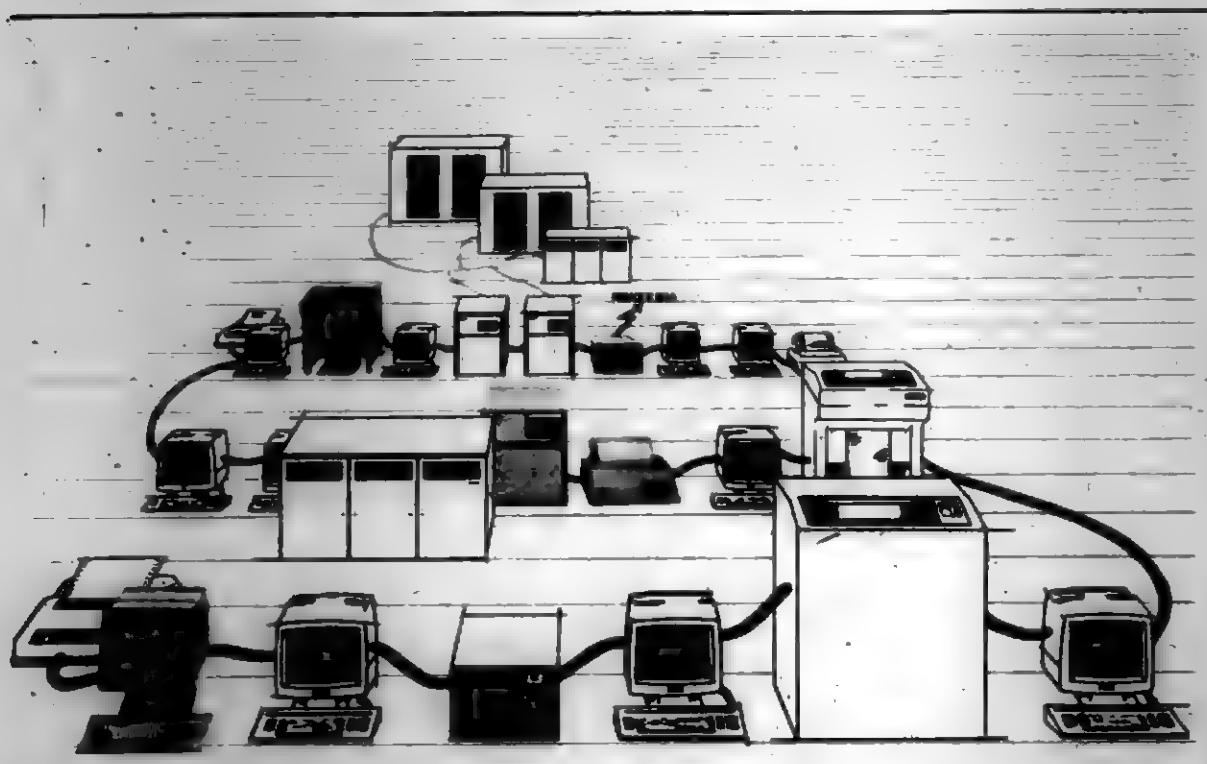
Joann is a systems manager for a large urban bank. She is an expert computer programmer and spends most of her time designing new systems for the bank to use. She feels comfortable in her job and challenged by her work. She hates meetings, wants to be left alone at work and experiences her co-workers as an unnecessary burden. She sometimes neglects her personal appearance. When she returns home at the end of the day, she communicates to her husband in a yes-no fashion and soon retreats to her room where she can have peace and quite.

Joann exhibits the classic behavior of the technocentered individual. Her relationship to the computer is determining her relationship to all else, and the computer comes first. She has reordered her priorities, and from her perspective, it probably appears to be a good arrangement. She thinks of herself as successful and well-adjusted, and only friction with her family may force her to see the harm being technocentered has done to her personality.

Highly motivated computer users, like any other achievement-oriented workers, have a strong desire to excel. They want to master their work, expand their abilities and feel challenged. Most cannot tolerate loose ends, sloppy organization, undefined goals. They see themselves as plowing through a succession of problems and leaving a steady trail of completed tasks behind them. This outlook pushes them in the direction of control, because control engenders task completion.

Maladaptation of this kind is not simply the result of character flaws. Our entire culture is pushing people in the direction of computer compatibility. People do not generally learn to master the computer for the same reasons they master the violin. The majority of computer users are forced to learn the technology, directly or indirectly: directly, through fear of losing one's job, or indirectly, through an awareness that career success and advancement hinge on computer skills. Companies expect high performance from their work force just as they do from their machines, and ambitious people must learn to meet the high standards of electronic space or move aside.

Adaptation to intense computer work is a complex phenomenon.



3270 Networking: No More No Man's LAN.

Imagine. 3270 Processing. IBM-Compatible Personal Computing. Local Area Networking. And SNA Compatibility. In One System.

Imagine a system that successfully settles the uncharted territory of 3270 local networking—that "no man's LAN" of unlinked and unrealized potential.

Imagine a system that delivers the power of 3270 processing, and the flexibility to build two local area networks from a single controller. Imagine being able to attach up to 120 devices to that controller. Or attaching four distinct controllers—and multiple coaxial links of up to 10,000 feet each—to any of those LANs.

Imagine the economies of a system that handles that networking with standard 3270 coax. That requires no commitment to special architectures or non-standard LAN technologies. And that, thanks to a multi-drop, station-to-station design, can eliminate thousands of feet of new coax.

Of course, such a system would have SNA compatibility. But it would also have a set of capabilities to dramatically increase throughput, while reducing hardware and support costs in *any* environment. Capabilities like multi-host and multi-personality support, application and address switching, and system printing.

This system would have multi-user personal computing "built into" the network—allowing you to assign true 16-bit computing power, maintain overall MIS control, and share expensive disks and printers.

Such a system would boast an intelligent display station that displays a mastery of ergonomic and aesthetic design. With multi-screen formats, anti-glare screen, low-profile keyboard, and a tilt-and-swivel pedestal with the smallest footprint in the industry. Such a system would also include a full line of printers.

Imagine. 3270 processing. IBM-compatible personal computing. Versatile, economical, powerful local area networking. In one system.

Braegen *has* imagined just such a system. They have designed it. Built it. And called it the ELAN™ System.

If such a system sparks your imagination, give us a call. We know the feeling. The Braegen Corporation, 525 Los Coches Street, Milpitas, CA 95035, (408) 945-8150; TWX: 910-338-7332.

Braegen. Where Networks Better

BRÆGEN

™ELAN is a trademark of The Braegen Corporation.

Computer literacy, which once referred to an ability to use software and perhaps do a little programming in Basic, has broadened. It now often means familiarity with several computer languages and systems and, by extension, enough ease with the technology to use it to expand one's own abilities. For the achiever, there is continual pressure to stay on top of the technology, since it is constantly evolving as new products appear, change and disappear. There are no niches to slip into and relax.

Pressure on the computer worker can be enormous. When large companies computerize, slipups can be disastrous: The smallest error can disrupt a delivery schedule or misplace millions of dollars.

The smallest glitch can ruin an entire day. Boundaries between the self and the world of the machine become dangerously fuzzy.

Jack is a senior programmer for a large bank. When a new system goes on line, he spends his night in a motel near the bank so that if problems develop, he is nearby to come fix them. Every night for weeks afterwards, even when he sleeps undisturbed, he dreams that he's received the dreaded phone call — "It blew up!" — and must jump out of bed to get the system running again before the entire staff comes in to use it.

Harrowing or not, this pressure is exactly what many computer workers thrive on. Challenge is often the stimulus that motivates them. Attracted by the possibility of doing jobs faster and better, they push themselves from competence to excellence. Completing a predetermined task is no longer the real goal; designing more difficult tasks and mastering them is.

To create the challenges they need, computer workers keep improving on already workable solutions — writing more elegant code, shortening a procedure — so that the tasks at hand keep expanding to fit the available time. As a result, deadlines are always imminent. The computer workers in this case have a high degree of personal involvement in the work they are doing. Their nervous systems are extremely attuned to minute fluctuations in the work system. The smallest glitch can ruin an entire day. Boundaries between the self and the world of the machine become dangerously fuzzy.

With the new mastery of information and problem-solving skills, mental work loads become heavier. The incessant choices that must be made when a complex task is handled as a sequence of subroutines add to the burden.

At 42, James is a systems analyst at a manufacturing company. An ace analyst, he is a worker with few peers and one who, because few others understand what goes into the job, earns little praise. Since at each job only he understands the various programs, he feels constantly badgered to clarify them to co-workers. He explains, "I feel as though more and more information is demanded of me." Large chunks of his time and energy are drained. He has worked for four employers in 10 years. Each time James quits a job, he feels an intense freedom, a tremendous sense of release that lasts until his knowledge catches up with him at another job. He is, ironically, a victim of his own expertise.

Users may begin to feel tired and find they cannot calculate as quickly, plan as well or make decisions as carefully as before. Mental engagement is high-pitched, concentration intensely focused. The person is immersed in processing information, which overshadows normal sensory awareness. Users may start to lose track of time — a morning spent on a problem can seem like no time at all. Meals are skipped and meetings missed as a problem is pursued. Symptoms of an overtaxed mind are not as easily recognized as those of an overtaxed body, so hardworking computer users bend their minds to questionable limits.

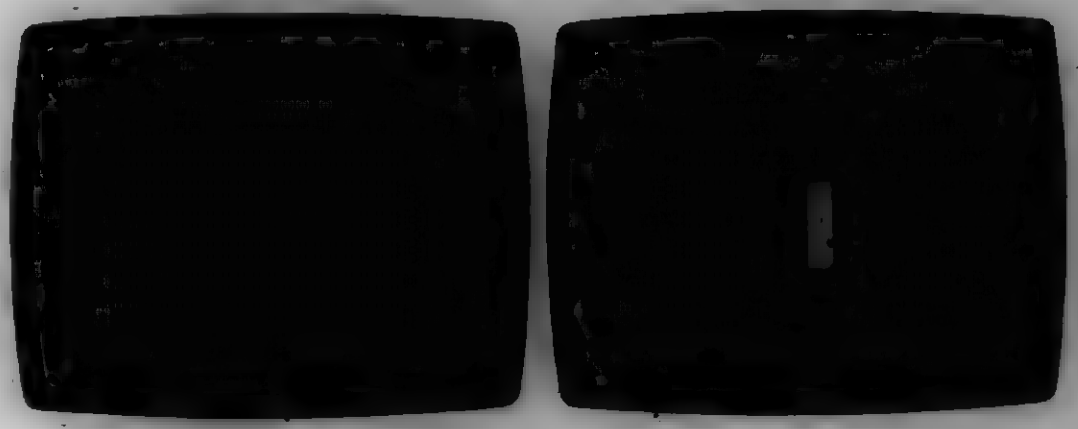
Shelley is a senior systems analyst in her 30s whose design work for a large company includes diagramming responsibilities and calculating work flow. She has to think in a precise and orderly fashion. She is aware that the job is making tremendous mental demands on her, and when she leaves work she needs a long time to disengage from her "work mode" of thinking. To make the transition, she takes a shower, which helps to tell her she is home.

"But that doesn't always work," she says. She cannot always make the break between work life and home life. Shelley has a four-year-old child, and she has begun to worry that her job has affected her abilities as a mother.

"Being a mother is about interruptions," she says, "and being a good mother is being able to handle them. Right now, I just can't tolerate interruptions."

Computer workers like Shelley are not yet technocentered — they are still capable of feelings — but they are on the threshold of becoming emotionally distant, a preliminary symptom of technostress. By contrast, psychologically healthy workers maintain a balanced relationship with whatever technology they use. They are able to be highly involved in their work without losing their own sense of self. When the pressure is on, they can maintain an integrity of personality by paying attention to their own limits, staying in touch with others and looking for ways to

INTELLECT.™
NO SOONER SAID THAN DONE.



To use INTELLECT, the natural language query system, all you have to do is ask—in everyday conversational English—and you'll retrieve. Immediately, in either text or full-color graphics.

INTELLECT, the world's only successful true natural-language query system, is an ideal tool for your information center. INTELLECT's powerful information retrieval capabilities are so advanced that it understands questions and responds with answers as if you were talking to a knowledgeable colleague. Executives access data themselves—more easily than ever before—without learning any technical jargon or "computerese." It's so easy to use, it doesn't even have a training manual!

Whether you use INTELLECT as a retrieval system or as an effective data analysis tool, it transforms raw data in the data base into information and presents it in finished color graphics in a matter of seconds. It's a live dynamic interface that fully integrates your existing database and graphic systems.

Already hard at work in hundreds of organizations, INTELLECT is ideal for marketing, finance, personnel, manufacturing, and banking applications.

INTELLECT is an important technological breakthrough. You can learn more about it by attending one of our nationwide seminars. Or put its amazing power at your fingertips in minutes with one of our demonstration tapes.

Call or send coupon for more details. Look into INTELLECT, and be an eyewitness to the future of computing.

integrate their work with their personal lives.

They remain sensitive to the world and open to the challenges of new experiences. Newness refreshes and deepens them; it does not simply overwhelm or overstimulate them. Most of all, they maintain the capacity for insight — an emotional and intellectual understanding of themselves. Psychologically healthy workers will try to adapt the environment to their needs, not simply adapt themselves to their environment.

But working with computers is a potent activity. Overidentification with the machine can cause an unhealthy relation to one's work, crippling the psychological bases of insight. People in a pretechnocentered state begin to lose perspective; sometimes a pivotal point is reached when they realize that work is becoming all-encompassing, that they are "not themselves." At this point, they may decide to try to come to grips with the situation, acknowledging their personal problems.

This realization does not come easily. Yet without it, these people continue as before and, driven by the desire to excel, slip ever closer to a machine-like ideal. A human-oriented view of the world disappears, replaced by a technology-oriented view.

Technocentered people push themselves in a constant effort to improve their work performance. They ignore their own limits. Mental fatigue sets in and, with it, increasingly rigid thinking, less creative solutions, an unconscious slowdown in work rate and a higher number of errors. Technocentered workers pattern their behavior after the technology. They don't take breaks, they don't talk about nonwork subjects, they don't think abstractly and, above all, they don't question the reason for doing the job. The greater the fit between them and the technology, the less energy is wasted in struggling to improve performance.

Technocentered people are trapped on a treadmill, although they lack the insight and the self-awareness to understand they are. In the process, they sacrifice a feeling grasp of the real world. All that exists outside logical processes seems fuzzy to them.

Scott is an electrical engineer who does computer programming as part of his job. He must use mathematical equations to calculate the most efficient layouts for detailed electrical circuits. He describes his work as a vortex. At home at night — to his wife's distress — he finds himself lost in the equations fixed in his head, his mind going over and over a certain sequence, tracing the endless connections between numbers. It is a problem he feels compelled to solve but cannot. Night after night, at home, his mind makes its logical loops.

Psychological defense

The desire for technical mastery and the absence of social contact reinforce each other. Like a psychological defense, the technocentered person's relations with the outside world remain within safe bounds because the same behavior patterns are repeated again and again. Nothing new is experienced. Little is unpredictable. These people resemble a broken record played over and over. Freud, in referring to neurotics, called this sort of closed behavior the repetition compulsion: repeating past experiences and continually failing. Similarly, technocentered individuals are condemned to repeat a present with which they overidentify.

Where "technoanxious" people experience a sense of accelerated time, technocentered individuals lose all track of it. Hours and minutes are irrelevant as the task at hand consumes consciousness. Natural limits intrude upon them — their workday ends, they eat dinner, they go to sleep — but these seem only irritating discontinuities.

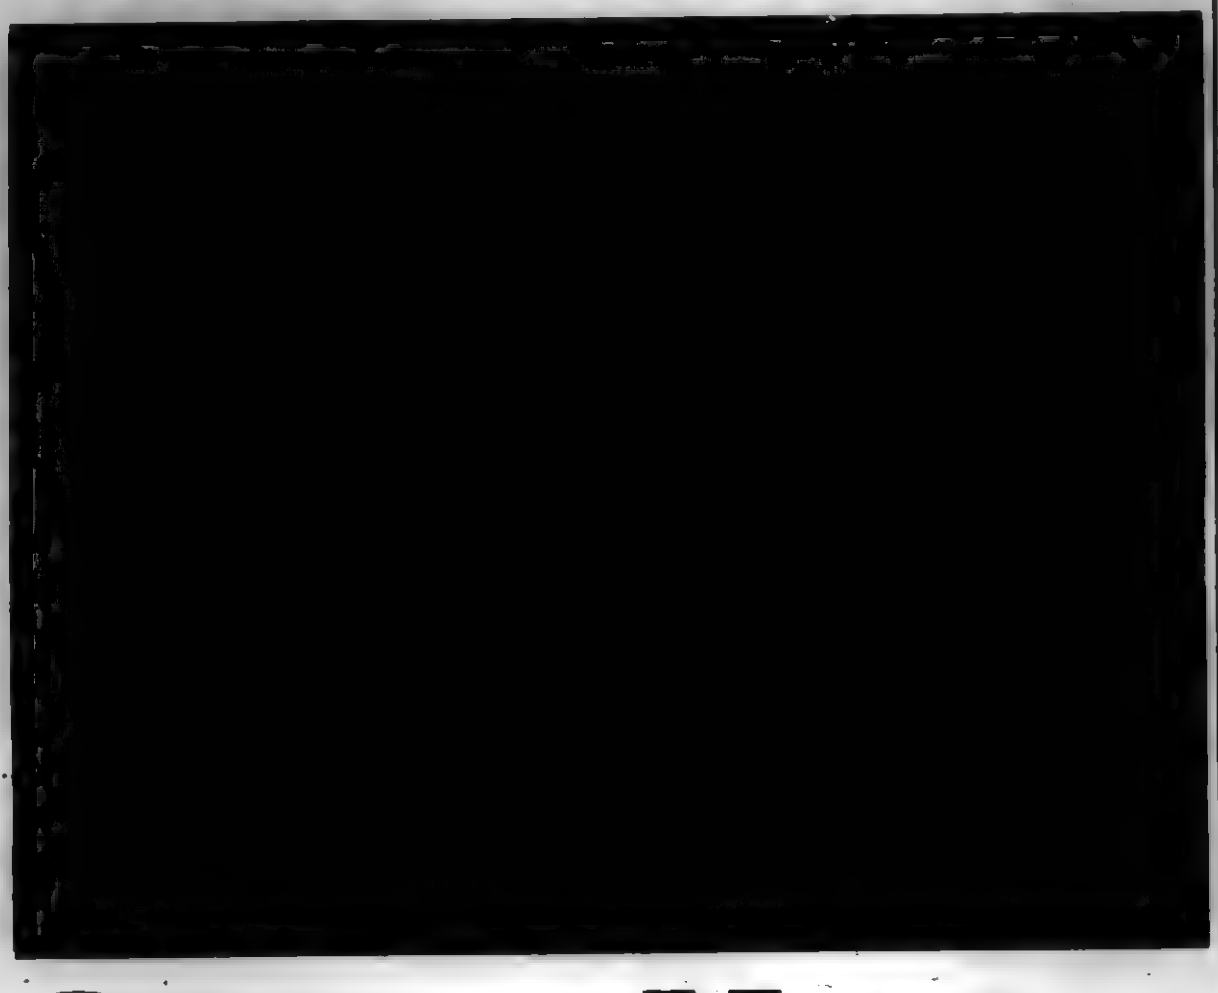
Where staff meetings may be unwelcome interruptions to adapting technical employees, they are intolerable interference to technocentered workers, who feel that meetings detract from their mission to generate code and work intensely with a program.

Jerry is a programmer working on a financial package for a software company. He has always found staff meetings and socializing with coworkers to be an annoyance, but lately he has become angered by any interruption in his work, no matter how trivial. "It's like making love," he says of programming. "If you were making love, you wouldn't want to be interrupted."

Bill, a team leader and lead programmer for IBM, comments, "I hate meetings. I suffocate at meetings. They're a complete waste of time."

Technocentered individuals operate in terms of perfection, sequential thinking, logic. Their entire cognitive structure is geared to the computer. Ambiguity and nuance are concepts the technocentered mind cannot "process." Communication must be efficient. Abbreviated language appeals to them because it accelerates communication. They weave acronyms and technical shorthand into their speech as much as possible. They prefer to communicate with people who are "system literate" so as to transfer information quickly, not interact. People who talk slowly or in general terms are avoided or ignored.

In the early stages of this syndrome, human relationships are a slight irritation. At work, friendships are superficial. Socializing is a vexing intrusion on work at the terminal. At home, excuses start. "One more line of program is all I have." Or, "Sorry for not paying attention, I



was thinking about work." Unfinished tasks dominate their private thoughts. Given a choice, they prefer to be left alone.

In full bloom, the condition leaves no room for excuses. At home, "I'll be through in a minute" becomes "Don't you understand what I'm doing?" At work, tenuous human alliances fade. The most minor interruptions are not merely irritations, they are a major source of stress. For the technocentered person — flat, without affect — it is the friction of social relations, not machine relations, that can provoke outbursts of anger. Such outbursts, however, are not so much manifestations of deep-seated hostility as they are mechanisms to ward off interference. For the technocentered worker, only productivity matters; unstructured, unfocused or irrelevant activity has no redeeming value.

Instead of friendships, technocentered people satisfy what need for social contact they still have by superficial conversations. They have acquaintances, not friends, and the acquaintances are mostly those with whom they can talk shop. Genuine friendships require commitment and energy, and there is little time for either. Talking about nontechnological subjects is an exhausting effort.

Robert is a scientist for a high-tech company. He depends on a computer system daily to sort, analyze and model many of his hunches about chemical processes. He is enthusiastic about his work and often stays after hours. Lately, he has been irritated by things being out of place at home and annoyed by what he perceives to be his wife's slow thinking. He is unsettled when she uses too many words to express herself clearly or when she tells a story. He is angry, generally, because she does not conform to his standards of perfect performance. He takes work home now in the evening so he can be left alone.

For technocentered people, the desire to conquer the system becomes greater than the desire for human relationships and human pleasures. The process of computer operation itself becomes pleasurable. The heightened stimulation of solving problems within a decision tree or making decisions several times a minute is a motivating force all its own. This mental engagement can be as exciting as sexual arousal and makes the habit that much harder to break.

Adding to the stubbornness of the condition is the fact that these people are blind to their own predicament. The push for immediacy, the concentration on present problems only, weakens their ties with past experiences and, thus, their ability to reflect on their lives. Their memories stretch only to the most recent events. For technocentered people, memory becomes "access to past events," an access limited by "search procedures" and "schemes for selected perception."

Increasingly, when pressed for additional or more in-depth information, they will respond, "I haven't got access to that." This answer is not defensiveness, merely a determination that there is insufficient information available to make a reply. Memory, from this perspective, is only recall. The healing power of memory is undermined. Technocentered people forget they once were different.

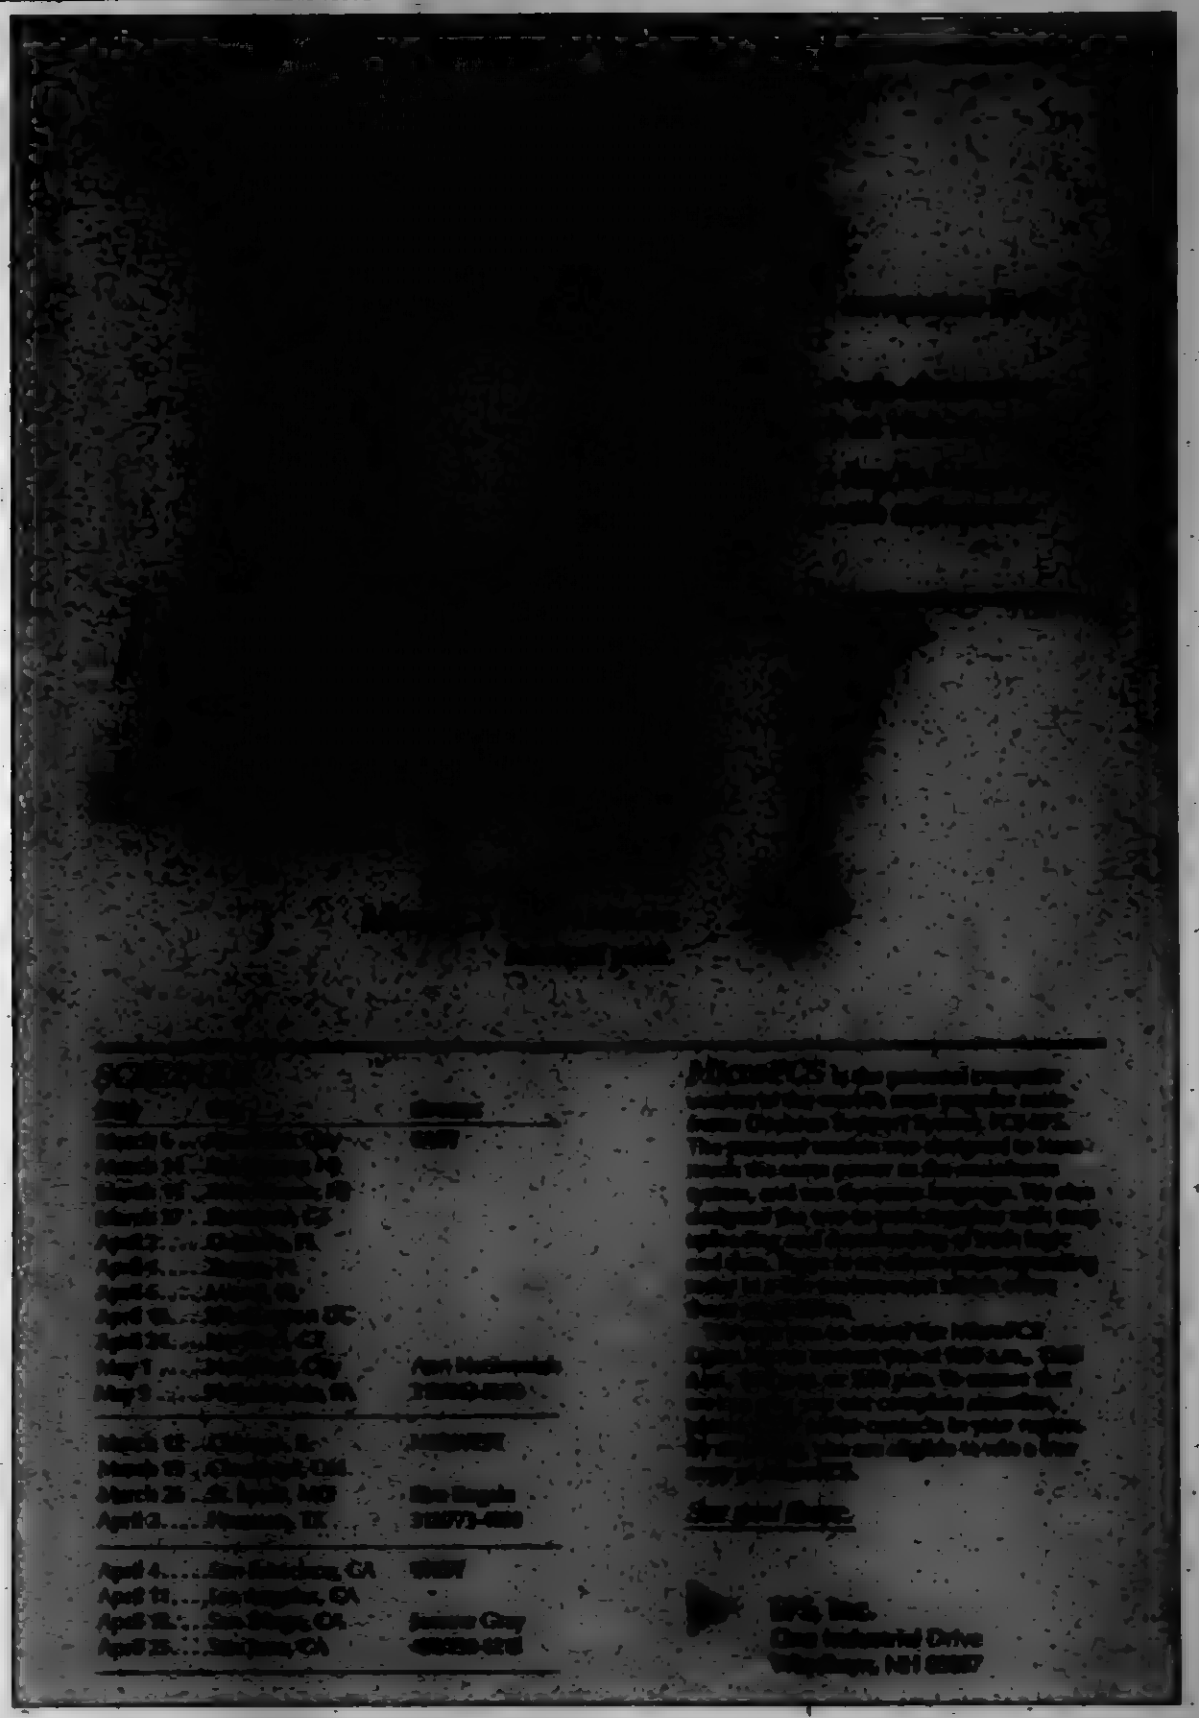
For the technocentered person — flat, without affect — it is the friction of social relations, not machine relations, that can provoke outbursts of anger. Such outbursts, however, are not so much manifestations of deep-seated hostility as they are mechanisms to ward off interference.

To the casual observer, technocentered people may seem to be the computer age's version of the obsessive compulsive, the character type often associated with workaholics. Technocentered people certainly resemble obsessive compulsives, but the differences are significant.

Both groups have trouble managing time and working within normal schedules. They lose themselves in detail and cannot abide disorder or loose ends. Along with their intense powers of concentration, a fear of losing control is evident. Neither type is capable of appreciating and enjoying the nonwork-related experiences of everyday living, although the obsessive-compulsive person can be warm and affectionate.

Obsessive compulsives in general have an overdeveloped sense of volition, a belief that the world is what they make of it, that willpower shapes all. This attitude leads to both intellectual and emotional rigidity; they sometimes seem to be trying to control and redirect all their emotions and desires. The result is a peculiar kind of self-awareness, as though an internal overseer were constantly issuing commands. Obsessive compulsives often fall into role-playing, even going so far as to control the details of their facial expressions and ways of speaking. Compared to other neurotics, they are detached and self-critical; guilty consciences, self-doubt and worry are common. Conflict haunts them.

Technocentered people, by contrast, feel no inner conflict. Where



obsessive compulsives carry out their jobs — whether doctor, lawyer or secretary — "as if" committed to them, technocentered people, whose work is with computers, are their jobs. Where obsessives are preoccupied with self-doubt, technocentered people are not. They have no nagging sense that something psychological is wrong. They feel pressure, but they experience it as a desire to excel, to match the perfection of the machine. This absence of conflict is obvious when they talk about their work. Whereas the "overseer" within obsessives drives them to perform work they "should" do, technocentered people never feel forced to do their work. They are attached to it. Their needs and the demands of the system seem one and the same.

Obsessives harbor a latent hostility. They bristle when criticized. They present an appearance of hardness, of being "uptight." Technocentered people, by contrast, effect a waxen expressionlessness. They accept criticism as data to be processed; hostility is too exhausting and irrelevant. Much of computer work, in fact, requires that workers listen to and accept critical suggestions aimed at improving their end product.

Whereas the "overseer" within obsessives drives them to perform work they "should" do, technocentered people never feel forced to do their work. They are attached to it. Their needs and the demands of the system seem one and the same.

A keen sense of personal guilt drives obsessives, who, whether at work or at home, always feel they are not doing quite as they should, which pushes them into acting out even more assiduously their various roles. Technocentered individuals live without guilt. They lack altogether a feeling for other people that is a precondition of guilt. Without guilt, they can easily dismiss appeals from others to change.

The motivation to change is also quite different for the two personalities. Obsessive compulsives have a high tolerance for suffering, but they nevertheless do not lose their ability to suffer. This factor is crucial, because even an incomplete awareness of suffering can serve as a stimulus for change. Obsessives may be pushed to change by a feeling that their lives lack meaning, that their relationships are less than satisfying or that they are not as creative in their work as they would like to be.

Technocentered people are only dimly aware of suffering, if at all. They may freely concede that work is stressful or that they are not pleasant to be with, but they accept that as the way things are. If adjustments are needed, they assume others can make them. They see themselves as successful, even happy. For a breakthrough to occur, an outside crisis is necessary, such as a spouse threatening to leave.

The obsessive compulsive is a classic neurotic personality type, molded by experiences and relationships from early in life. Obsessives bring their bag of neuroses to any activity and any job — stocking shelves, playing softball, managing a company — and turn it into a pressure-filled experience. The personality shapes the work.

The technocentered person is a creation of technology. Victims may once have been sociable, relaxed and caring, and after leaving their computer jobs, they soon become so again. The problem is not rooted in deep-seated neuroses. The work has determined the personality.

Some of the attributes of the obsessive compulsive are greatly valued in today's society, shaped by the Protestant work ethic. Erich Fromm has observed that the obsessive-compulsive is the norm of industrial culture. We admire people who succeed in high-pressure jobs; the self-motivated, hard-charging young executive-on-the-move is a glamorous and envied model.

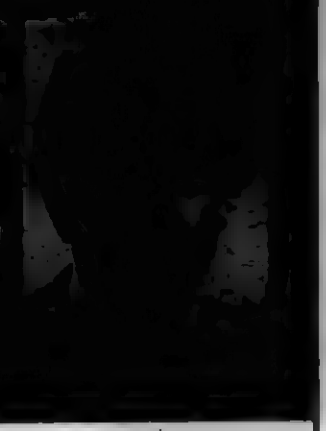
But computer work invites a dangerous transformation of these qualities. Achievers may bring to any job the desire to perform well, but if the nature of that job is not based on a perfect machine-like ideal, any obsessive-type characteristics are softened and the workers retain their basic humanity. The special demands of working with computers exacerbate those obsessive compulsive qualities without allowing for humanizing influences, such as ample social contact with other workers or a relaxed and informal milieu. The overspecialized character that results from high performance in technical work is destined to become the norm of electronic culture.

About the author

Craig Brod, a psychotherapist who has been in private practice for 10 years, is a consultant to government and industry on how to integrate new technologies into the workplace. He lectures at the University of California at Berkeley Extension/Continuing Education for Business and Management and writes on computers and adaptation.

His experience with computers includes creating programs designed to build a more sensitive match between the individual and the machine. He lives in Berkeley, Calif.

8 Good Reasons to Attend the James Martin Seminar



1. James Martin has been writing **THE BOOK** on the Computer Industry for over 3 decades.
2. He is the most sought after consultant in the Computer Industry.
3. His predictions and recognition of major computer developments are unsurpassed.
4. With over 31 top-selling books, Martin is the industry's #1 selling author of all time. His book, *Application Development without Programmers*, is the Computer Industry's #1 selling book of all time.
5. James Martin has the unchallenged reputation as the world's finest lecturer in his field. Over 20,000 individuals worldwide have attended the James Martin Seminars. Many return year after year.
6. James Martin "... can lay fair claim to being the most influential DP guru of all time." — *ICP Interface*
7. A fast-moving, high-density, interactive 5-day program packed with information for all DP designers, management, and staff. Quite honestly, the James Martin Seminar is the industry's best educational value for the money.
   - Attend the seminar designed to dramatically increase your DP capability.
   - A major increase in productivity is attainable through the methods taught in this seminar.
   - 5 days with James Martin will dramatically alter your approach to DP.

Many DP organizations are beginning to break the cycle of low productivity, poor responsiveness, and high application backlog of traditional DP. Now is the time for you to act. Attend the James Martin Seminar this spring. Learn the new technologies and their application to your organization. You'll discover why James Martin is ....

8. ... The Man the DP Experts Listen To!

Check the appropriate box on the coupon for more information on James Martin's 1-Day Seminar, THE END USER REVOLUTION for executives and professionals everywhere who ought to be using computers more effectively. This 1-day seminar will be held on the first day of the 5-day seminar.

Call (213) 394-8305 or
mail the coupon today for a detailed brochure.

Lingering effects of breakup seen

By Lynn Haber
CW Staff

WASHINGTON, D.C. — The breakup of AT&T more than a month ago has created a crimp in long-range corporate telecommunications planning, according to attendees interviewed recently at Communication Networks Conference & Exposition (Comnet '84).

"We were anticipating some effects from the divestiture, but not to the degree that they've occurred," said Allen N. Boggs, manager for network development and support at Texas Instruments, Inc. "I'd say we've seen reduced service to the point of having a negative effect on day-to-day business dealings. It's difficult to get service on existing circuits."

Boggs works with a substrategy group of the company's electronic communications strategy group, which deals directly with these types of issues. "Like many people, we blame the Federal Communications Commission [for] not deciding what to do; therefore, AT&T doesn't know where to go, and [all] down the line communications managers don't know how to proceed. Presently, I'd say we're suffering from a lot of frustration."

Mary H. Gallagher, supervisor of telecommunications for Ford Aerospace & Communications Corp., Newport Beach, Calif., said her corporation realizes the need for advanced planning and organization but doesn't have any facts to go on. "There seems to be daily changes of rules and regulations, making advanced corporate planning very difficult," she said.

"At a few of our facilities we put in our own systems. But at three other facilities we have Bell systems. We'll be taking a closer look at changing those systems to a private system, but we're waiting to see what the rate increases will look like. For us, cost is what impacts us the most."

> *'I'd say we've seen reduced service to the point of having a negative effect on day-to-day business dealings.'* — Allen N. Boggs, manager for network development at Texas Instruments, Inc.

Tom Fisher, who works for Reliance Communications Technologies, a supplier of telecommunications equipment in Richardson, Texas, said his company has not yet seen any "hard effects" as a result of the divestiture. But "we didn't do too much planning because we didn't know how it was all going to happen."

Attendees said that because they faced a lack of facts and figures regarding the AT&T breakup, many corporate strategies have been reactive rather than active.

"We knew things were coming, but in terms of strategy we operated in a reactive mode," said John Chambers, supervisor of the data communications management section for the Tennessee Valley Authority in Chattanooga, Tenn. "In conversations with the telephone people, there wasn't any definitive information that they could give us. Therefore, we have to guess as to what to tell our users."

Like many of the other people interviewed, Chambers shared problems like not knowing who to call for service and discovering that the regional holding companies were unsure of their own courses.

Michael S. Friedman, director of sales for Access Engineering Corp., Reston, Va., foresees great new market opportunities as a result of the telephone company breakup. "The [former] Bell operating companies will be hungry for new business — and they'll be looking to outside vendors like they've never done before," he said.

In terms of internal company strategy, Friedman believes the divestiture will simplify that strategy. "For the first time, we'll be allowed access to areas that weren't available to us before."

Japan prepares to realize dream in 1990s

Special to CW

TOKYO — The 1990s will be an era during which the integration of computers and communication technology makes great strides in Japan, moving the country closer to becoming an integrated high-information society.

The Japanese government also wants this period to realize connections between corporate computers and implementation of office automation technologies on a wide scale.

To achieve these goals, Japan's Ministry of International Trade and Industry (Miti) initiated a proposal for a "New Media Community."

At the same time, the Ministry of Postal Service established a concept for a Future Communication Model City which it nicknamed "Teletopia."

Also in pursuit of the concept of the information society, Japan's Telegraph and Telephone Public Corp. (JTT) proposed the Information Network System (INS), which calls for building a new network system and providing a wide range of services utilizing digital technology, optical-fiber technology and other advanced technologies.

The Miti report

In September 1983, Miti released its "New Media Community" report along with a study titled "The High-Information Society and New Media." These reports discussed the impact of new media, such as two-direction CATV and videotex, upon various sectors of society. They also detailed problems to be resolved for the development and implementation of new-media technologies as well as proposals for government action.

One report recommendation, for example, was that the government promptly carry out a total review of the country's communication-related system and attempt to standardize the basic components of the industries that are related to the new media.

The reports went on to say that in order

See JAPAN page 92

Net saves school districts more than $500,000

RICHARDSON, Texas — A regional data processing network recently expanded its services to 214 school districts while saving more than $500,000.

The North Texas Multi-Region Processing Center, headquartered here, was established in 1970 and served just two districts. Today, its IBM 3081-D mainframe processes payrolls, grades, accounting work and other tasks for school districts spread over a 44-county area.

The center saved over $500,000 by using a Datastream Communications, Inc. Model 774 remote controller to tie relatively inexpensive Ascii terminals and microcomputers into the network. Those terminals provided the smaller school districts with the on-line access that larger districts enjoyed with IBM 3270 terminals.

"The smaller districts have historically had to rely on manual procedures because of the costs associated with installing interactive terminals. There's the expense of hardware and software, combined with leasing long-distance lines and adding new staff, which districts on a limited budget simply can't afford," Peter Coffey, assistant director of the processing center, explained.

Some of those smaller districts needed on-line access, while larger districts wanted to improve their access by adding less expensive Ascii devices to installed terminals. "We figured there had to be a way to bridge the gap between the 3270 computer terminals and low-cost Ascii terminals in a network environment so that all the districts could enjoy the benefits of streamlined data processing," Coffey said.

Marvin Sanders, director of the center, estimated that converting thousands of programs to allow use of Ascii terminals would have cost more than $500,000 on top of any hardware costs.

The Datastream 774 supports up to 16 directly attached terminals, or a larger community of casual users on a dial-in, port-contention basis. The center has installed four 774 controllers throughout the region where there are currently 400 IBM 3270s and 36 Ascii terminals, primarily Televideo Systems, Inc.'s Model 910s.

Coffey estimated that it would

JAPAN from page 90

for the new media to make any headway, restrictions on existing systems should be abolished, which would, therefore, spur new activity and freedom. This, the reports argued, will lead to a more competitive market, and the multiplicity of services which utilize the new media will provide users with a wide selection of services.

In tandem with these ideas, a report concurrently prepared by the Investigation and Research Group for the Future Planning of Telecommunication Systems stated that in order to enhance the freedom of the users and to promote an advanced and sophisticated telecommunication system, principles of free competition should be introduced.

The report also encouraged the utilization of satellite communication, standardization of protocols, consolidation of research and development projects, construction of data bases and the consolidation of legal systems.

The Miti reports maintained that consolidation or standardization of the basics of the new media will enhance progress, conserve resources and contribute to the advancement of the industrial structure of the country.

In terms of data base services, Miti recommended that future procedures for preparation, circulation and utilization of information should be streamlined and standardized.

Construction of various data bases should be promoted, and, at the same time, a clearing service should be established. Finally, the development of data base-related technologies should be pushed forward, according to Miti.

The postal report

The postal report is the result of a round table discussion in October 1983 that was conducted to come up with a "Teletopia" plan.

The premise of the group meeting was that the "high-information society is led by telecommunications as the means for transmitting and processing information."

The report called for a combination of systems in the information society, with an emphasis on JTT's INS and the above Miti concepts, resulting in the realization of "model cities."

JTT's INS

JTT's INS project is budgeted at over $4 billion. The money has been earmarked for the replacement of the existing analog equipment with digital equipment and for the interconnection of Tokyo, Osaka and Nagoya by 1986.

Other major cities will be connected to the digital telephone network in 1987. The system will then be extended to connect cities with populations over 100,000 in 1990, and JTT will eventually extend the digital service to the entire country.

Facsimile communication networks, data networks and videotex communication networks will be connected with the digital telephone network by 1987.

Services utilizing INS will then include advanced telephone services, multifunction facsimile services, image information services, message communication services, data communication services and multimedia communication services.

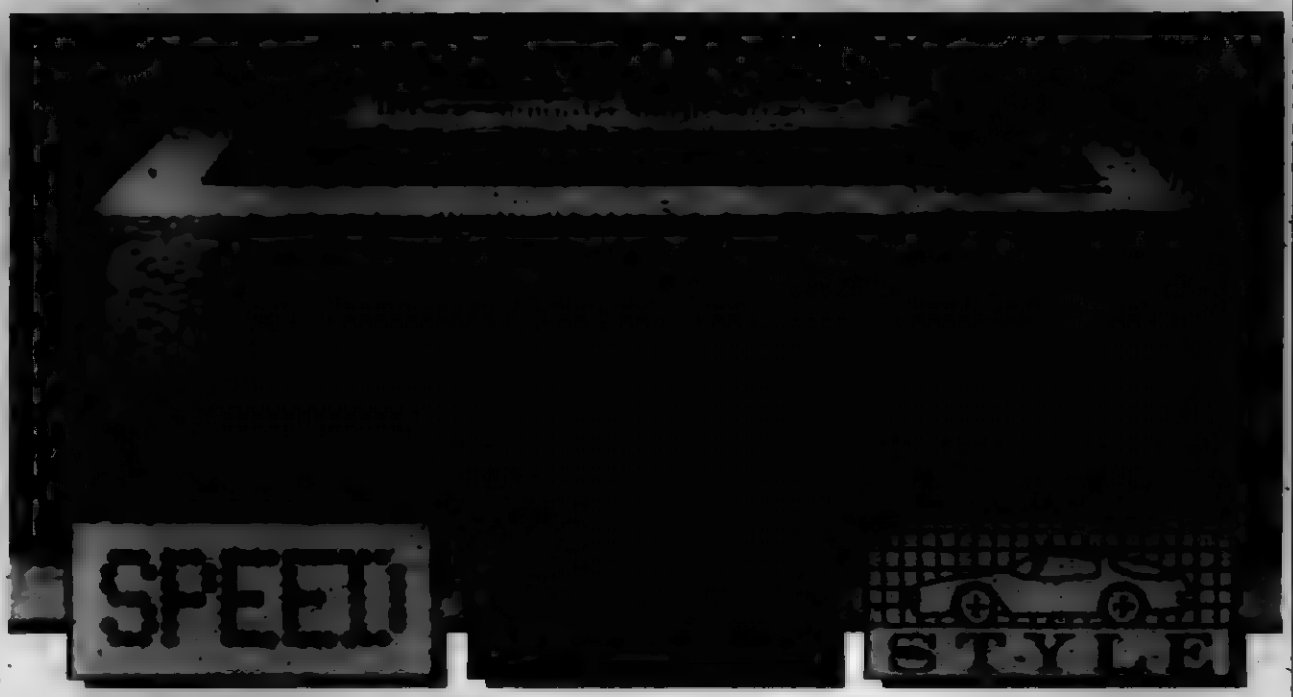
HIGH PERFORMANCE
NOW AVAILABLE IN A THREE-SPEED



INTRODUCING THE NEW DS 220 MULTI-MODE MATRIX PRINTER
First there was the Datasouth DS180. The original high-performance printer. The printer that raised the standards of on-the-job performance to new heights. A tough act to follow.
And now, following in the same tradition, is the new Datasouth DS220. State-of-the-art performance, taken to higher levels. In a new 3-speed multimode form. Ready to run data, near letter quality and graphics output—in a single printer.
At data speed, the Datasouth DS220 leaves competitors in the dust. By using high speed tabbing to zip over blank spaces and true logic seeking to print the next available character, the Datasouth DS220 charges through printed copy at speeds rivaling more expensive line printers.
At 40 CPS NLQ speed, the Datasouth DS220 creates near letter quality output with the kind of class that might make you wonder if it was produced by a daisy wheel printer. With its fine tuned 18 x 48 dot matrix, multiple fonts are produced with the precise clarity required for word processing applications.
And for graphics, the Datasouth DS220 adds high performance style to popular microcomputer applications programs through high resolution dot addressable output. Sharp new details emerge from business charts and graphs, and engineering drawings.
And those are just its printing capabilities. Its fully instrumented dashboard allows push button programming of up to fifty features for forms control, communications and print style selection.
Best of all, the Datasouth DS220 costs much less than you might expect for a high performance three speed. Go to your nearest showroom and run a Datasouth DS220 through the gears. See how little it costs to own three high performance printers in one high performance package.

How To Get A Better Grip On Your 3270 Network.

With More Flexibility Than Ever Before.
Getting a grip on your 3270 applications is a real challenge. You've got to find the best way to bring IBM host applications to non-3270 terminals and personal computers. Without a lot of fuss and bother.

Fortunately, Datastream has a flexible solution. One that won't cost you an arm and a leg.

With our 3270 SNA or BSC Cluster Controllers, you can attach personal computers, ASCII terminals and printers to IBM hosts, giving more people 3270 functionality. And giving you more control of the computing activities in your company.

Our Multi-Path Controller allows personal computers and ASCII terminals to communicate not only with multiple IBM mainframes, but with minicomputers (including DEC®) and time-sharing hosts as well. It even allows personal computers and terminals in the network to talk to each other.

All Datastream controllers feature security, dial-in or direct-connect access, remote dial-in diagnostics and more.

To extend your 3270 investment even more, use our controllers with Datastream's low-cost Display Stations. They offer 3278 functionality keystroke-for-keystroke. Plus features even IBM doesn't have. Like DEC VT100 emulation. Remote dial-in. Additional soft keys. And other 3290-type keyboard features like 24 PF keys.

All this makes for a very tidy, secure, economical way to expand your network.

And put 3270 within everyone's reach.

COMMUNICATIONS

COMMUNICATIONS SOFTWARE

OPTIMATION, INC.
Software package

Optimation, Inc. has introduced a software package that provides a communications link between any Hewlett-Packard Co. 200 series desktop computer and a Digital Equipment Corp. VT100 terminal emulator via RS-232 lines.

The package reportedly includes the emulation of the full screen editor available to DEC users along with up-and-down loading of files.

It features vertical scrolling of up to 1,000 lines and horizontal panning of up to 1,000 characters with the use of a configuration screen, according to the vendor spokesman.

The system is priced at $900.

Optimation Data Center, 200 California Ave., Palo Alto, Calif. 94306.

FLEXCOMM CORP.
Selvax Link

Flexcomm Corp. has announced the Selvax Link, software that connects Gould, Inc.'s Sel Concept 32 series superminicomputers to Digital Equipment Corp. VAX-11 series superminicomputers.

Selvax Link reportedly integrates operating systems without requiring any modifications. A user can transport files from system to system, communicate with remote system operators or take up residence on a remote system, the vendor said.

The product costs $13,500 for each node connected to a CPU, according to the vendor spokesman.

Flexcomm, 15245 Pacific Highway S., Seattle, Wash. 98188.

NETWORK RESEARCH CORP.
Fusion 2.0

Network Research Corp. has announced the Fusion 2.0, an enhancement to the company's Ethernet software, which allows it to support Advanced Research Projects Agency's Internet and Xerox Corp.'s Xerox Network System protocols.

The software links systems using Motorola, Inc.'s 68000 microprocessor, Unix or Microsoft, Inc.'s MS-DOS operating systems, according to the vendor.

Digital Equipment Corp. VAX-11 and PDP-11 minicomputers can be tied into a network, the vendor said.

Prices range from $750 to $7,500, depending on installation, according to the vendor.

Network Research, Suite 200, 1964 Westwood Blvd., Los Angeles, Calif. 90025.

MULTIPLEXERS/ MODEMS

RACAL-MILGO, INC.
Omnimux options

Racal-Milgo, Inc. has announced two options for its Omnimux series of statistical multiplexers. The bisynchronous channel option reduces transmission delays in bisynchronous data communications systems. The dual aggregate option is designed to reduce the number of multiplexers, modems and/or parallel communications lines in asynchronous systems.

The bisynchronous option provides two channels per card, and each channel operates up to 9,600 bit/sec, using Ebcdic and/or Ascii character sets, the vendor said. The price is $900.

The dual-aggregate option allows two or more Omnimux multiplexers to transfer data over one or more links simultaneously. It is designed for three major asynchronous applications: load sharing, split link and channel bypass, according to the vendor. The price is $1,000.

Racal-Milgo, 8600 N.W. 41st St., Miami, Fla. 33166.

PHALO CORP.
Multiplexer series

Phalo Corp. has announced a series of multiplexers that connect IBM 3270 communication controllers to remote devices.

The multiplexers feature multidrop capability, support for extended distance options and proprietary architecture. Diagnostic capability allows the user to test controllers or remote devices without disconnecting the multiplexer, according to the vendor.

A multidrop system for 32

COMMUNICATIONS

devices costs $7,200; a 32-device system with diagnostic capability sells for $5,695; and an eight-device multidrop system costs $1,750.

Phalo, 65 Moreland Road, Simi Valley, Calif. 93065.

KINEX CORP.
9600 Fast-Poll

Kinex Corp. has introduced the 9600 Fast-Poll, a 9,600 bit/sec modem for multipoint applications on unconditioned leased lines.

The modem continuously monitors and displays line quality. Each time the system is polled, the modem retrains the system so variations in the line will not affect others, the vendor said.

The modem features a built-in error rate tester, comprehensive diagnostics and front-panel control signal display, according to the vendor. The price is $3,350.

Kinex, 6950 Bryan Dairy Road, Largo, Fla. 33543.

NATIONAL COMPUTER COMMUNICATIONS CORP.
NCC 12/24

National Computer Communications Corp. has introduced the NCC 12/24 full-duplex modem for direct-dial line use.

The product handles synchronous or asynchronous data at a rate of 2,400 bit/sec or 1,200 bit/sec, which is compatible with the Bell 212A modem. The modem will automatically adapt and respond to Bell 212A-compatible units at 1,200 bit/sec, the vendor said.

Features include manual and automatic answer modes and test and diagnostic capability including V.54 Loop 2 and V.54 Loop 3 capabilities.

Its price is $1,195.

National Computer Communications, 260 West Ave., Stamford, Conn. 06904.

LIGHTWAVE COMMUNICATIONS, INC.
FO-422

Lightwave Communications, Inc. has announced the FO-422, a fiber-optic modem designed to link terminals, printers and other devices requiring an RS-422 interface.

The FO-422 accommodates data rates of 10M byte/sec over distances of up to one kilometer of fiber-optic cable. It is plug-to-plug compatible with existing RS-422-type, 37-pin, D-subminiature connectors, the vendor said. Its price is $300.

Lightwave Communications, 650 Danbury Road, Ridgefield, Conn. 06877.

LOCAL-AREA NETWORKS

COMPLEXX SYSTEMS, INC.
Xlan Kit

Complexx Systems, Inc. has announced the Xlan Kit, a local-area network system which is designed to link a small number of devices, yet is expandable to handle up to 192 devices at distances of up to 10,000 ft.

The system includes two interface devices that contain built-in modems. The modems feature a 300 bit/sec transmission rate and autoanswer/autodial, 100 ft of twisted, shielded pair wire and the hardware necessary to complete a local-area network, according to the vendor.

The system is a baseband, carrier-sense multiple access local-area network that operates at a transmission rate of 1M bit/sec. The interface can connect Ascii asynchronous terminals, personal computers and other peripheral devices. Each interface has three asynchronous RS-232C ports, the vendor said.

The kit costs $2,995 and can be ordered with up to 3,000 ft of additional wire at 12 cents/ft. Additional interface devices are priced at $1,450.

Complexx Systems, 4030 Research Drive, Huntsville, Ala. 35805.

AUXILIARY EQUIPMENT

THE GRASS VALLEY GROUP, INC.
Wavelink Model 3291 option

The Grass Valley Group, Inc. has announced an option for its Wavelink Model 3291 fiber-optic communications system that provides concurrent audio and data transmission with video on a single fiber.

Lear Siegler
Quality and Reliability You Trust. High Touch™ Style You'll Prefer.

This new generation of Lear Siegler video display terminals brings elegant High Touch™ style to our American Dream Machine (ADM™) tradition. The family features three new ergonomic terminals designed to meet the needs of OEMs and end users alike: the ADM 11, the ADM 12 and the ADM 24E.

Here is a whole new way for terminals to relate to people. Dozens of little touches add up to the convenience and comfort of High Touch.

For example, we put the power "on/off" switch and contrast control knob in front where they're easy to reach.

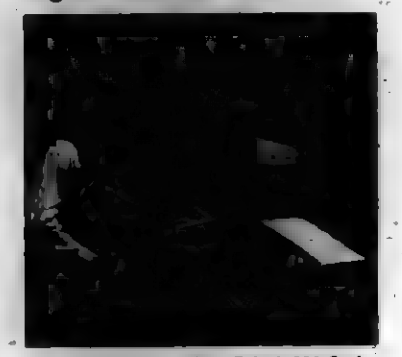
The monitor not only tilts and swivels, it stops positively in almost any position.

The clean, crisp display features a large character matrix on an easy-to-read green or amber non-glare screen – made even easier to read by the hooded bezel. Screens are available in 12" or 14" sizes.

You get the best in style and ergonomics, plus all the outstanding performance features you'd expect from Lear Siegler (see chart).

Lear Siegler High Touch terminals are backed by the broadest network of full service centers anywhere, serving 3000 cities nationwide. And they're made in America – designed, engineered, manufactured and shipped from Anaheim, California to provide you with the best local support.

Place your order today by calling your local Authorized Distributor or, for quantities in excess of 500 units, your Regional OEM Sales Office.



Lear Siegler's new VersaPrint™ 500 Series printers combine with Lear Siegler video display terminals for hard copy output.

Low-profile, tapered, DIN-standard keyboards with Selectric layout feature logical key groupings and adjustable tilt for comfort and efficiency. ADM 11 shown above.

COMMUNICATIONS

Continued from page 96

The option comprises the 3291-11 modulator module and the 3291-12 demodulator module. The Wavelink Model 3291 [CW, Feb. 21] broadband communications system transmits analog signals using an LED source and an FM transmission method over a distance of 10 km in a long-distance version and 2 km in a short-distance version.

The price is $950 each for both modulator and demodulator modules.

The Grass Valley Group, P.O. Box 1114, Grass Valley, Calif. 95945.

TELLABS, INC.
3004X series

Tellabs, Inc. has announced the 3004X series of quad data link interface modules, which provide up to 18 composite data link interfaces for the company's 331 Xplexer data switching system.

The modules include models 3004A and 3004B. The 3004A provides four RS-232C V.24/V.28 interfaces for use with synchronous private-line modems. The 3004B module provides four integral digital line driver/receivers as part of the vendor's Plexerlink interface.

The 3004A costs $450 per interface. The 3004B is priced at $650 per interface.

Tellabs, 4951 Indiana Ave., Lisle, Ill. 60532.

APPLIED SYSTEMS AND PRODUCTS
Universal Modem Adapter

Applied Systems and Products has introduced the Univeral Modem Adapter, which allows a Commodore Business Machines, Inc. Commodore 64 or 20 microcomputer to be used with any type of telephone.

The product supports modular or nonmodular phones, including one-piece electronic phones with built-in dialing, the vendor said.

The Universal Modem Adapter is priced at $14.95.

Applied Systems and Products, 1021-H W. Bishop, Santa Ana, Calif. 92703.

DISTRICTS from page 91

have cost the center $14,000 per site to add 3270s, which some school districts couldn't afford. "We were able to obtain the Ascii terminals for a little over $500 apiece and the four Datastream 774s for $9,950 per system," he noted.

Now, most of the school districts have on-line data processing. Typical uses include grade reports, test scores, student record reports, class scheduling, payroll, warehouse records, vehicle maintenance, tax accounting, fixed assets and personnel-file handling.

"The Datastream equipment has made it possible for the center to automate its information flow, tying together districts that wouldn't even communicate without such a vehicle. Since we installed the 774 units, other manufacturers have come out with similar systems, but as long as the price remains competitive, we plan to stick with what's done the job for us," Sanders said.

The next step for the center will be a printer pass-through upgrade, using Datastream software that Sanders said will turn many of the school district terminals into remote job-entry workstations. That will involve moving up to Televideo 925 terminals.

But one roadblock to that next phase has been finding printers on which users can easily change forms. Sanders said that most users who move into the remote job entry system will need a variety of forms, such as blank checks, that will require continual changes in the feeders.

Earlier networking problems, such as inconsistent power supplies and "normal Ma Bell problems," have been corrected, according to Sanders. He added that Datastream plans to correct another inconvenience — the lack of a local-service technician.

"Overall, we're very satisfied with the project. I would say that the estimate of $500,000 in savings is extremely conservative," he concluded.

Doesn't Work.

Now for the Bad News.

The guy who controls many not work any more, either. He just left the software company you bought it from on his never-ending search for greener pastures. Or, the company may have developed it in the first place. You need help, and you're out of luck.

It doesn't have to be that way. All of Data Design's software products are developed by Data Design. We have enjoyed less than a five percent employee turnover rate in over a decade (industry average is 20%). You can be confident that the person who developed the Data Design system you bought is still with the company. Ready to provide the responsive, knowledgeable support—during implementation and beyond—that is consistently rated the highest in the software industry in nationally recognized independent software surveys. Follow-up maintenance (each customer is assigned their own personal Account Manager), telephone consultation and a 24 hour emergency hot-line service are included with the purchase of each system. So are full installation assistance and in-depth training (at Data Design or at your facility).

There are many reasons why we have attained a reputation for supplying the finest financial application software packages and service available. Among them are the shared commitment of our employees to product quality and service (we are 100% employee owned) and their high level of data processing and accounting skills—40% have graduate degrees in business management.

To learn how the following systems work for a broad range of medium to large size companies on most major computer systems, contact us today. Planners and accounting managers at hundreds of major corporations already have.

☐ General Ledger/Financial Control
☐ Accounts Payable/Purchase Control
☐ Fixed Asset Accounting

Our reputation for excellence has been built on years of providing the highest quality products and services to these customers. Call us today at 800-556-5511 (408-730-0800 in California) or complete and return the coupon below.

Large systems hardware is not an impulse buy.

Now there's a guide coming to you that will help with your homework.

The *Computerworld Buyer's Guide to Large System Hardware* is designed to give you a valuable, one-stop information source for large systems hardware and peripherals. Take a look at all the tools it will give you to help you make the right large systems choice:

- Large systems product listings, including mainframes, superminis, minis and small business systems and the terminals and peripherals designed to work with them. You'll get listings of printers, memory products, teleprinters, controllers, magnetic media and supplies, plotters, digitizers and much, much more.

- Vendor profiles that include company name, address, contact information, and primary markets served.

- An industry-specific editorial section that's designed to keep you right up to speed on the trends in large systems hardware. We'll give you news of the latest developments in mainframes, superminis and minis and their changing roles. You'll get information on the latest management techniques used in running data centers; planning for cost effectiveness and the new technologies in fifth generation computing.

- In addition to its comprehensive listings and editorial, the *Computerworld Buyer's Guide* will give you pages of detailed ads for large systems hardware products and peripherals that you can refer to all year long.

Each issue of the *Buyer's Guide* is updated before publication, and contains hundreds of listings that are accurate, complete and easy to use. This *Buyer's Guide to Large System Hardware* is distributed to *Computerworld's* 114,000 subscribers in the U.S. — it's one more of the additional benefits you get as part of your *Computerworld* subscription. Look for it this April 18th.

And if you market your products to buyers of large systems hardware and peripherals, this *Buyer's Guide* will reach them with your product message just when they're researching products and vendors. Reserve space in this *Buyer's Guide* by March 2nd by calling one of the sales offices listed below, or call Ed Marecki, National Sales Director or Kevin McPherson, Product Manager, at (617) 879-0700.

SYSTEMS & PERIPHERALS

Solving future storage problems

Special to CW

Many DP shops these days are trying to integrate diverse computer systems.

Aside from the problem of developing interfaces for all these systems, there is another problem developing: that is, how DP shops will control information storage and retrieval.

With information storage gaining importance in many information-intensive firms, many businesses have already installed some form of computer-assisted information indexing, storage, retrieval and recall for short-term needs. Desktop microcomputers that interface with a floppy disk drive or mainframe processor regularly accomplish short-term storage and retrieval needs. For longer term applications, both mainframes and microcomputers are often linked to micrographics systems, such as microfilm or microfiche, for information record maintenance.

With the development of the video disk player, a new technology entered the fray. Video disks can play back images through the use of binary code formation and a laser light reader. The challenge was to develop a way for computer users to take advantage of that technology. That challenge appears to have been met in the building optical disk drive industry.

With all this in mind, there appears to be three key interfacing issues that will make up the office information chain of the future.

First is the information processing facility or center itself. This is where data, words and documents are input and output. Professional managers as well as traditional computer operators will use desktop terminal keyboards, video displays and high-speed printers to enter, review or access information in order to make business decisions.

A second important element in data storage is the temporary or short-term

MPP processes satellite data

Supercomputer claims world's fastest I/O rate

By Tom Henshel
CW Staff

AKRON, Ohio — Goodyear appears bent on building big things. Everyone is familiar with the Goodyear Blimp, and now researchers at the Goodyear Aerospace Corp. claim to have developed a computer system with the fastest I/O rate in the world.

Even the name is big. The system is called the Massively Parallel Processor (MPP) and was developed for the National Aeronautics and Space Administration's (Nasa) Goddard Space Flight Center to evaluate satellite data. Installed last May, the system is still being tested and will not be in full production until midsummer, a spokesman for Nasa said.

GOODYEAR

Technically, the MPP is a supercomputer. But it does not use a pipelined architecture like the Cray Research, Inc. Cray 1 and Control Data Corp. Cyber 205. The MPP is a single-instruction, multiple-data processor.

Processors working in parallel

According to Paul Gilmore, program manager on the MPP project, the MPP has 16,384 individual processors working in parallel to perform a single operation. Gilmore said the processor can perform 6.5 billion additions or subtractions in a second. The processor also offers a theoretical I/O rate of 320G byte/sec.

The MPP architecture consists of an array of 128 by 128 custom-designed bit serial processing elements. Each processing element has its own data and memory with associative memory search capabilities, Gilmore explained.

Unlike pipelined supercomputers, which can perform floating-point calculations at extremely high speeds, the MPP garners its speed from thousands of fairly simple processors, all executing instructions simultaneously.

Gilmore said the MPP performs at its best in executing fixed-point calculations. Consequently, the MPP vastly outperforms the Cray-1 and Cyber 205 in applications involving short, fixed-point calculations.

However, for larger, floating-point applications, the pipelined processors show a performance advantage over the MPP, Gilmore noted.

The types of calculations that can be performed by the MPP are particularly useful to scientists doing image processing.

In image processing, such as applications involving satellite data, remote sensing measurements of an object are translated into an array of numbers that represent the object. The numbers can then be analyzed by the processor. In addition to processing satellite data, the image processing technique is used in diagnostic medical imaging, weather forecasting and oil exploration," according to Gilmore.

But in addition to image processing, Gilmore said, the MPP may prove a very useful tool in developing artificial intelligence processors.

Gilmore noted that because the MPP has an extremely high I/O capability, the unit can very quickly scan a large data base for information. Dealing with extremely large lumps of information, such as those required for expert systems, has been one stumbling block to developing artificial intelligence techniques, Gilmore contended.

There is a problem

But even though the MPP has the potential of offering an I/O rate of 320G byte/sec, there is a problem. Gilmore said that currently there are no peripherals, such as disk and tape drives, capable of performing anywhere near the I/O speed of the MPP.

Consequently, the MPP installed at Nasa's Goddard Center has achieved an I/O rate of about 1G byte/sec by using Digital Equipment Corp. peripherals and a DEC VAX-11 series supperminicomputer as a front-end processor. Goodyear, he added, is currently working on a project to develop faster peripherals to support the MPP.

Like the Cray 1 and Cyber 205, the MPP carries a hefty price tag. The base price on the system is about $4 million. So far, aside from the Nasa system, Goodyear has yet to receive an order for an MPP. However, it has sold several of the MPP's predecessor, a unit called the Sartan, which is currently being used in projects sponsored by the U.S. Army, Navy and Air Force and Nasa.

Kurzweil 4000 scanner debuts

Kurzweil 4000 scanning system

CAMBRIDGE, Mass. — Setting its sights on the low-end office automation market, Kurzweil Computer Products, Inc. has announced the Kurzweil 4000, an intelligent scanning system that can input both typewritten and typeset material.

The 4000 features intelligent character recognition, which enables the system to learn to recognize most type fonts. The system can reportedly accomplish this with little user intervention and can learn unique characteristics of a specific font after a user training session.

An offshoot of the reading machine for the blind, a product that gained Kurzweil recognition in 1976, the Kurzweil 4000 is the first product the firm has produced since its take-

See KURZWEIL page 104

IBM chip touts fast data exchange

YORKTOWN HEIGHTS, N.Y. — Engineers from IBM have developed an experimental amplifier chip that reportedly speeds up the data exchange between processors and I/O devices.

IBM claims the device exchanges data 16 times faster than any amplifier the firm currently uses. The chip is located in a controller that uses a fiber-optic transmission line to send data back and forth to a processor.

Currently, an IBM spokesman said, controllers use copper transmission lines to send data at a rate of 25M bit/sec.

With the newly developed amplifier, data can be sent at up to 400M bit/sec. IBM said that rate translates into better than 17,000 typewritten pages in a second.

The fiber-optics device uses strands of refined glass to send laser or LED light, which pulses to convey computer data signals.

A converter at the sending end of the fiber-optics line changes electronic signals to light pulses and sends the signals through the glass fibers. A converter at the receiving end changes the light back into electronic signals, according to the spokesman for IBM.

The technique was designed by Dennis Rogers and Albert Widmer of IBM's Yorktown Heights research facility and was manufactured under the direction of Joseph Mosley at IBM's East Fishkill, N.Y., facility. IBM did not specify when it would use the device in a commercial product.

SYSTEMS & PERIPHERALS

TURNKEY SYSTEMS

MCDONNELL DOUGLAS AUTOMATION CO.
BDS/GDS

McDonnell Douglas Automation Co. (McAuto) recently announced the availability of the Tektronix, Inc. 4115 color raster terminal with its building design system (BDS)/general drafting system (GDS) for architectural and engineering applications.

The terminal reportedly provides a 60Hz noninterlaced refresh rate, a resolution of 1,280 pixels by 1,024 pixels and 256 displayable colors.

The systems are available in turnkey configuration with Prime Computer, Inc.'s 2350, 250, 750 and 850 computers and Digital Equipment Corp.'s VAX-11 series.

Prices start at $129,000 for a system comprised of either three-dimensional BDS or two-dimensional GDS system software with a 4115 terminal and digitizer, a printer and a Prime 2250 computer.

McAuto, P.O. Box 516, St. Louis, Mo. 63166.

PROCESSORS

THE WOLLONGONG GROUP
Pegasus

The Wollongong Group has introduced a family of products for Digital Equipment Corp. VAX-11s.

The Pegasus line was designed for the 32-bit superminicomputers operating under either Unix or DEC's VMS operating system. According to the vendor, Pegasus offloads interactive editing functions, which involve host system context switching and terminal I/O communications in a keyboard-transparent environment.

The Pegasus 1116 consists of 1M byte of memory, a 5¼-in. floppy disk for initial program load and diagnostics and an interface to the Xerox Corp. Ethernet local-area network. It is priced at $30,000.

The Pegasus 2116 has all the functions of the 1116, plus an additional 1M byte of memory and support for multiple VAX host systems. According to the vendor, it entails the provision of terminal multiplexer, concentrator and local-area network switching functions. The price for the 2116 starts at $35,000.

The Wollongong Group, 1129 San Antonio Road, Palo Alto, Calif. 94303.

DATA STORAGE

TANDEM COMPUTERS, INC.
4114 drive; 4110, 4111 price cuts

Tandem Computers, Inc. recently announced a 264M-byte Winchester fixed-media disk drive, designated the 4114, that it said provides greater flexibility and price/performance to users of the firm's Nonstop transaction processing systems. The company also announced price reductions for its 4110 and 4111 128M-byte disk drives.

The 4114 provides 264M bytes of formatted storage in a sealed module. The unit is the top drive in a two-drive cabinet. The bottom drive, designated the 4115, is identical to the 4114, according to Tandem.

The 4114 is compatible with Tandem's other models. When configured at 240M bytes, it can also be mirrored with the Tandem 4104 removable-head, 240M-byte disk drive.

The 4114, including cabinet, is priced at $20,500, and the 4115 is priced at $19,000. Both are available immediately on Nonstop II and Nonstop TXP systems.

Additionally, Tandem reduced the U.S. price of its 4110 and 4111 modules. The 4110 top drive, including cabinet, has been reduced from $19,500 to $15,850, and the 4111 bottom drive has been reduced from $16,500 to $14,350.

Tandem Computers, 19333 Vallco Pkwy., Cupertino, Calif. 95014.

TERMINALS

ZENTEC CORP.
Zentec 1021

Zentec Corp. has announced a low-end terminal that is said to provide the same features as more expensive terminals.

The Zentec 1021 features a 12-in. diagonal screen, ergonomic design, multiple emulations, 32 graphics characters and editing capabilities.

The 1021 terminal comes in two versions. The first emulates several terminals, including the Hazeltine Corp. 1500, Lear Siegler, Inc. ADM 3, Digital Equipment Corp. VT52 and Applied Digital Data Systems, Inc. Viewpoint. The second version, the 1021A, supports the Ansi X3.64 standard.

The terminal is available for $399 in OEM minimum quantities of 100.

Zentec, 2400 Walsh Ave., Santa Clara, Calif. 95050.

PRINTERS/ PLOTTERS

AMPAK BUSINESS SYSTEMS, INC.
ABS Laser Pro 2700; ABS 200 EPM Thermal Printer; Epson RX-80 Matrix Printer

Ampak Business Systems, Inc. (ABS) has announced add-on printers for IBM minicomputers and microcomputers.

Continued on page 102

Lease a Magnuson PCM for a short term at low, long term rates...

We'll give you long term rates. You give us a short term commitment. With more processing power to the dollar, the Magnuson M80 is the most cost-effective alternative to IBM's 4300 series. Now Phoenix Leasing sweetens the deal by offering low, two-year rates on a lease you can cancel after every 6 months—with no penalties! **Phoenix Leasing means inexpensive flexibility.** Meet your immediate processing needs, without tying yourself to projected long term hardware requirements.

Compare Magnuson with IBM

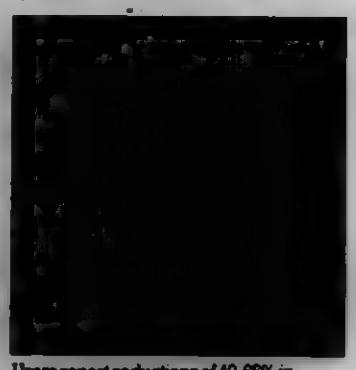
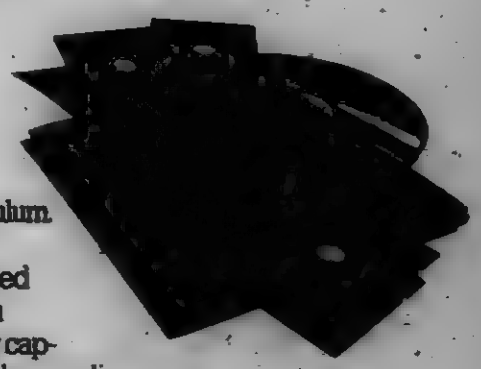
THE LONG & SHORT OF NEW UNIX™ INTERACTIVE VIDEO TRAINING.

Independent study results show that student recall and retention improve up to 26.3% with interactive video.

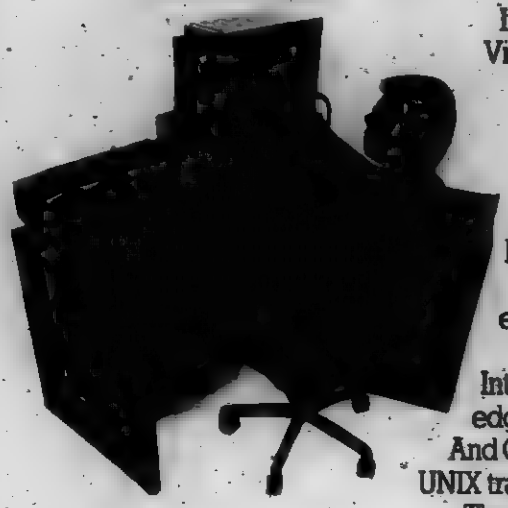


Users report reductions of 40-66% in training time with interactive video.



What way to train UNIX is the best way to train UNIX? Live classroom instruction? Passive video? Or interactive-video?

Studies show there is no faster, more effective, training method than interactive video.



Introducing the first UNIX Videodisc Training Curriculum. Vision.

It combines the power of the computer, the speed of a laser disc and the personality of live classroom instruction. Vision Interactive Videodisc Training captures and holds a student's interest in a way no other medium can.

Students learn by doing. So they learn faster, comprehend better and retain information longer. They spend less time away from the job. And are more productive once they return.

Because Vision training is targeted, you can choose just the Courses you need for your employees. And students learn only what they need to know to do the job. Now.

What's more, Vision was developed by Interactive Training Systems, the acknowledged leader in interactive video training. And Computer Technology Group, a leader in UNIX training.

The result? UNIX training so fast, so effective and so affordable, we back it with a full 30-Day Money-Back Guarantee.

Plus, if you lease all three Vision Curriculum courses for one year, we'll give you the use of an IBM PC, laser videodisc player, color monitor and Interactive Training System Controller. Absolutely Free.

Take advantage of our Free Introductory Offer. Send in the attached coupon. Or call us at 1-800-227-1127. Don't wait too long; you'll get caught short.

AFTER MARCH 31, 1984 OUR FREE INTRODUCTORY OFFER IS NO LONGER FREE!

☐ Please have a representative contact me immediately.

☐ Please send me more information about Vision, the UNIX Interactive Video Training Curriculum.

SYSTEMS & PERIPHERALS

Continued from page 100

The ABS Laser Pro 2700 and the ABS 200 EPM Thermal Printer are based on Xerox Corp. page printers. They were designed to connect with IBM minicomputers through the firm's controller and appear to the IBM system as an IBM 5225 matrix printer.

The ABS Laser Pro 2700 is said to print 12 page/min with 90,000 dot/in., multiple fonts and sizes, graphics capability and dual-input cassettes.

The ABS 200 EPM prints six page/min with 40,000 dot/in., multiple fonts, plain paper printing of text and graphics and auxiliary manual input for envelopes and labels.

ABS is marketing a third printer, the Epson America, Inc. RX-80 Matrix Printer, which incorporates a controller that offers compatibility with IBM's Personal Computer as well as IBM minicomputers, according to a vendor spokesman.

The unit was designed to operate at 100 char./sec, the vendor said.

The ABS Laser Pro 2700 is priced at $23,000, the ABS 200 EPM Thermal Printer at $7,495 and the RX-80 at $2,195.

ABS, 2640 Walnut, Tustin, Calif. 92680.

QUALITY MICRO SYSTEMS, INC.
Lasergrafix 1200 enhancements

Quality Micro Systems, Inc. has enhanced the capabilities of its Lasergrafix 1200 intelligent laser printer.

Enhancements include improved Diablo Systems, Inc. 630 daisywheel printer emulation, Qume Corp. Sprint 9/11 emulation, automatic bar and pie chart generation and improved Tektronix, Inc. 4010 and 4014 plotting, according to the vendor. The printer now supports arc and circle drawing, flood-fill commands and automatic page overlay.

The Lasergrafix 1200 costs $24,995.

Quality Micro Systems, P.O. Box 81250, Mobile, Ala. 36689.

AXIOM CORP.
Axiom TX-1000

Axiom Corp. has introduced a fixed-head thermal printer that provides hardcopy 160 dot/in. resolution with no hardware or software interface.

According to the vendor, the Axiom TX-1000 connects to the raster-scan video output of CRT terminals with a standard coaxial cable. It accepts a variety of video signals, including industry-standard RS-170.

The printer has a 3,000-element print head, which eliminates the need for chemicals or toners, takes 20 seconds to print a complete screen and comes with controls that vary picture positioning and magnification, the Axiom spokesman maintained.

The unit price is $3,395, with quantity discounts available, according to the vendor.

Axiom, 1014 Griswold Ave., San Fernando, Calif. 91340.

GRAPHICS SYSTEMS

GENISCO COMPUTERS CORP.
G-2200

Genisco Computers Corp. has introduced a series of color raster graphics terminals for computer-aided design and manufacturing and engineering (CAD/CAM, CAE) and business and scientific applications.

The basic model, the G-2200, is a terminal with detachable keyboard and a 19-in. color monitor. It features 1,024- by 792-pixel resolution, 60-Hz refresh rate, graphics and built-in support for mouse, tablet and printer.

The G-2200 terminal is software-compatible with the Tektronix, Inc. 4014 and will emulate Digital Equipment Corp.'s VT100 for text editing and data entry.

The RS-232 and RS-422 asynchronous serial links allow the units to receive data at rates as high as 100K bit/sec.

G-2200 costs $12,950.

Genisco Computers, 2545 Cadillac Ave., Costa Mesa, Calif. 92626.

TERAK CORP.
Slash 10; disk drive price cuts

Terak Corp. has an

Continued on page 103

SYSTEMS & PERIPHERALS

nounced the availability of an embedded, 10M-byte, 5¼-in. Winchester fixed disk drive with its 8510 and 8600 computer systems, as well as reduced prices on certain configurations of its older Winchester disk drive.

The new drive, the Slash 10, is the latest in a series of enhancements to the vendor's current product offerings. It is contained within the chassis of the desktop graphics system in place of one floppy disk drive. The unit enhances system performance while reducing its overall size, according to the vendor.

The Slash 10 is based on a Shugart Associates, Inc. 5¼-in., half-height drive with 12.7M bytes of unformatted capacity, a 90-msec average access time and a 5M bit/sec transfer rate. A minimally configured 8510 with the Slash 10 costs $11,730, while a basic, dual-display, color 8600 system with the Slash 10 costs $21,700.

At the same time, the company announced reduced prices on certain systems using its external 10M-byte, 8-in. Winchester disk drives. The University of Minnesota's Minn-Draft Instructional System with the 8-in. drive is now priced at $21,995, while Engineering Systems Corp.'s Design Graphix Commercial Drafting System with the 8-in. drive costs $32,975. All orders currently on backlog will be reduced to reflect the new pricing, a spokesman said.

Tavak, 14151 N. 76th St., Scottsdale, Ariz. 85260.

POWER SUPPLIES

TOPAZ, INC.
Power Conditioner

Topaz, Inc. has announced Power Conditioner, a power fluctuation monitor equipped with a microprocessor.

Power Conditioner monitors voltage fluctuations, detects power surges or sags and determines and supplies power needed to correct a surge, the vendor said. Four circuits reduce power line noise. Peak-limiting circuits reduce high-voltage noise, dynamic clipping circuits suppress low frequency noise, a resistor-capacitor snubber circuit quiets equipment-generated noise and linear filters furnish a 20 decibel attenuation of broadband noise, according to the vendor.

Power Conditioner costs from $7,645 to $14,440, depending on the configuration.

Topaz, 9192 Topaz Way, San Diego, Calif. 92123.

BOARD-LEVEL DEVICES

CONCEPT TECHNOLOGIES, INC.
Graphcard 100

Concept Technologies, Inc. has introduced a graphics controller designed to broaden the uses of the IBM Personal Computer or Personal Computer XT when used as a monochrome system. The product features emulation of Tektronix, Inc. 4010 series terminals.

The graphics controller, called Graphcard 100, implements a Graphic Software Systems, Inc. Ansi GKS Virtual Device Interface Standard. This allows the user to expand the functions of the IBM Personal Computer or XT. It boasts parallel and serial printer ports, as well as a serial port for a mouse, the vendor said. Existing IBM and third-party software programs are run by a circuit board that emulates and replaces IBM's Monochrome and Color/Graphics Adapter Boards, the vendor said.

The Graphcard 100 is said to offer graphics display with a 720-pixel by 352-pixel resolution when the on-board Intel Corp. 80186 coprocessor is used. An intensity level for highlighting provides for high-quality graphics and more interactivity, the vendor said. Graphcard 100 incorporates, through its multitasking system, the Intel 80186 processor to output high-resolution text and graphics to dot matrix printers. Other application functions are executed simultaneously, the vendor said. Low resolution "screen dumps" and the need for a plotter are eliminated by the simultaneous rasterization and application processing.

The Graphcard 100 costs $1,250.

Concept Technologies, P.O. Box 5277, Portland, Ore. 97208.

Connect with success.

IRMA™ is the industry's most successful IBM 3270 Decision Support Interface,™ with more than 25,000 installations.

IRMA, the first coaxial cable link between the IBM PC/PC XT and IBM 3270 networks, delivers the industry's best performance record. She's working successfully right now in more than 25,000 installations worldwide, giving PC users easy, economical mainframe data access, selection, storage and communication back to the mainframe.

And she's more capable than ever, with standard text file transfer software for VM/CMS and MVS/TSO mainframe environments, IBM 3278 Models 2, 3, 4 and 5 and IBM 3279 Models 2A and 3A screen support, plus optional APL Terminal Emulation.

If you want PC/3270 decision support that goes to work literally minutes out of the box, connect with success. With IRMA, the industry's most widely used and most thoroughly proven decision support interface. For information write DCA, 303 Technology Park, Norcross, Georgia 30092. Phone (404) 448-1400, TLX 261333 DCAATL. Or call us toll-free 1-800-241-IRMA. **Connect with success.**

SYSTEMS & PERIPHERALS

AUXILIARY EQUIPMENT

DATA EAST USA, INC.
Datafax 2000

Data East USA, Inc. has announced Datafax 2000, a portable, 10-lb, battery-operated facsimile transceiver.

The transceiver allows a user to communicate over pubic or private telephone lines with any CCITT GII fax machine. The product features a read-and-record mechanism capable of printing graphics output and a magnetic coupler which attaches to any telephone receiver, the vendor said.

The transceiver costs $995.

Data East USA, 470 Gianni St., Santa Clara, Calif. 95050.

COMPUSCAN, INC.
Interfaces

Compuscan, Inc. has introduced interfaces that connect the Alphaword Series 80 Pagereader with Digital Equipment Corp.'s WS78, 82, 103, 200 and Decmate word processing systems.

According to the vendor, the Alphaword Series 80 Pagereader is an optical character reader that can increase productivity of the DEC systems. Compuscan's Series 80, a modular scanner, scans and transmits text typed on standard typewriters directly to the DEC systems for recording on disk.

The Alphaword Series 80 with the DEC interface is priced from $10,390.

Compuscan, Building 2, 81 Two Bridges Road, Fairfield, N.J. 07006.

ELECTRO STANDARDS LABORATORY, INC.
Model 9316

Electro Standards Laboratory, Inc. has introduced a 16-channel switching system for IBM 3278-type information display terminals.

The Model 9316 was designed to accept inputs from up to 16 3278-type display stations and switch them either in bulk from one controller to another or in a programmed mix between two controllers. Model 9316 is available in a standard computer-room, rack-mount configuration, costing $1,050; it is optionally available in a desktop version, which costs $1,100.

Electro Standards Laboratory, P.O. Box 9144, Providence, R.I. 02940.

SIX IBMs ALL IN ONE CIE

It's like getting five IBM terminals free.

In a CIE-7800, you get plug compatibility with the IBM 3178 and all five models of the 3278 series. Yet, a multi-model CIE-7800 costs less than any single one of those IBM terminals.

Both smaller and bigger at the same time

What meets the desktop is a far more compact terminal, too. The CIE-7800 is 40% smaller than any IBM.

But, through the ingenuity of CIE/ACM design, what meets the eye is a screen over one-third larger than IBM's.

The CIE monitor also rotates and has an upward tilt of from 0 to 20 degrees for adjustable viewing. And it weighs less than 20 pounds, so it's easily moved. It's user-friendly to the *nth* degree.

22 keyboards

The detached, low profile keyboard has an 87-key IBM compatible layout. And it can be user-configured into any of nearly two dozen U.S. and international keyboards, all of which give you a continuous adjustment angle of from six to 11 degrees.

Alternate DEC® and HP 2622 personalities

The CIE-7800 is available with *concurrent* alternate personalities. With a single command, you can switch to DEC VT100,® or HP 2622, or IBM 3101-3104, or IBM 3275/3276-2 (bisynch single station), while still retaining IBM 3178/3278 compatibility. No other terminal is as versatile. Not one.

New CIE-7850 "add-in" intelligence

The new CIE-7850 is more than just an add-on. It's an add-in. As shown below on our screen, you simply plug the 7850 into the Coax-A line between the controller and terminal to give you access to both on-line mainframe processing power and local intelligence.

The CIE-7850 conducts concurrent operations in either 3178/3278 or its local intelligence mode, which is *100% IBM PC compatible.*

To learn more, just contact ACM, Inc., Suite 540, 3857 Birch Street, Newport Beach, Ca. 92660. Or call toll free 1-800-854-5959. In California, call 1-800-432-3687.

KURZWEIL from page 99

over by Xerox Corp. in 1980. It is also the least expensive device Kurzweil has ever announced, carrying a $35,000 price tag. Early reading machines from the firm cost about $100,000, and the firm's earlier office-oriented scanning machines cost roughly $70,000.

The Kurzweil 4000 is basically an enhanced version of the firm's first stab at the office automation market — a larger, more expensive machine that did not include the artificial intelligence capabilities of the 4000, noted Michael Backler, Kurzweil's vice-president of marketing.

The 4000 is equipped with an autotrain feature that enables the unit to make its own decisions in identifying text. In a demonstration, the unit was able to read through both typewritten and typeset material. When a new type style is introduced into the 4000, the operator must go through a training session in which the 4000 flashes computer-generated enlargements of characters on a screen along with the most likely letter match. The operator then must either respond by indicating whether the 4000's interpretation of the character is correct. If it is not correct, the operator can input the proper interpretation of the character in question. The 4000 will then make that interpretation in future cases.

Backler noted that the 4000 is usually correct in its interpretation of letters. How long a training session is used for a new font depends on the accuracy required in the application.

In addition to identifying letters, the intelligent character recognition software handles other problems such as determining where the text starts and distinguishing between very similar characters.

The Kurzweil 4000 can read approximately 30 to 40 char./sec. The Kurzweil 4000 comes with a scanning unit, CRT terminal and electronic tablet. The unit can be used as a stand-alone system or in an Ethernet local-area network.

It costs approximately $35,000 from Kurzweil, 185 Albany St., Cambridge, Mass. 02139.

DATA from page 99

information storage device. This will include computer-assisted magnetic media, solid-state chips and changeable optical data disks. All three technologies are easily alterable.

The third factor involving memory is permanent or historical storage. This is an area where computer-linked micrographics media will be used heavily. Other forms of long-term storage will include optical disks, permanent solid-state chips and, of course, paper. Paper is an irreplaceable form of permanent storage. It has specific applications that are eternal.

Each day, the business world becomes more dependent upon information. The various means of storing information for recall can only hold so much.

Eventually all stored information will have to be broken into short- and long-term formats. The challenge facing micrographics systems is to bridge the gap between various technologies.

Wolf is manager, national records systems support, for A. B. Dick Co. in Chicago.

Communications.

How to tie things together today without being tied down tomorrow.

This April, *Computerworld Office Automation* will give you a close look at the world of communications products and services. You'll read about what's out there now and what's coming. And how to get started while leaving your architecture open for the technologies of the future. And you'll get it all from the perspective of end users who have to increase productivity *now* while making sure the their company's investment won't be obsolete in two years.

And that's not all. There'll be feature articles on:

- PBX *versus* local area networks and how they'll merge
- voice technology
- videoconferencing technology
- satellite technology
- inter and intra company communications strategies
- product evaluations and comparisons

And after we cover all the developments for you, we'll offer you strategies to link them all together into one integrated system.

Computerworld Office Automation is designed to give you OA information geared to the DP/MIS environment — in a way that no traditional office publication can. As one of *Computerworld's* 114,000 subscribers in the U.S, you'll get six issues of *Computerworld Office Automation* in 1984 — as part of your subscription! And if your users need to increase their communications links, you won't want to miss this issue devoted to Communications in the office.

If you've got office automation and office communication products our readers should know about, then you need to get your ad reservation in by March 2nd.To reserve ad space in this April 11th issue of *Computerworld Office Automation*, call one of the sales offices listed below, or Ed Marecki, National Sales Director at 617-879-0700.

To: Ed Marecki, *National Sales Director*

LOS ANGELES/Bernie Hockswender, Bob Hubbard, Bill Healey *(714) 261-1230*

When Computerworld delivers the goods on manufacturing systems this March 26th, you'll definitely want to be there.

Ad deadline is March 9th.

In response to the increasingly heavy involvement of DP/MIS people in computer-aided manufacturing (CAM) and computer-aided engineering (CAE), *Computerworld* is preparing a Special Report that focuses on CAM/CAE, manufacturing resources planning (MRP), robotics, inventory and shop floor control.

We'll also cover the effect these new technologies are having on traditional manufacturing operations. And on the delicate relationships between traditional DP departments and the factory automation specialists.

If you act before March 9th — your products or services can be represented. To reserve space in this issue, call one of the sales offices listed below or call Ed Marecki, National Sales Director at (617) 879-0700.

MICROCOMPUTERS

Apple spurs approval of 3½-in. drives

By Paul Niemiewski
CW Staff

Apple Computer, Inc.'s use of Sony Corp. 3½-in. disk drives in its recently announced Lisa-2 and Macintosh microcomputers will spur acceptance of 3½-in. drives as the micro floppy (sub-5¼-in.) drive standard, according to industry analysts polled by *Computerworld*.

"Apple's decision provides additional momentum for adopting the 3½-in. drive as the predominant standard," said James N. Porter, president of Disk Trend, Inc., which publishes "Disk/Trend Report," an annual market study.

"The Macintosh drive means that practical technology has come to light in the microcomputer world," said Chris Christiansen, senior analyst at The Yankee Group in Boston. "The next generation of microcomputers will use high-capacity, 3½-in. drives rather than 5¼-in. drives."

The smaller disk drives offer users better reliability, faster data retrieval and more storage capacity than their larger, older brothers, according to manufacturers.

However, because different size drives are vying to become the industry standard, hardware manufacturers have been slow to adopt the new standard. The battle began in 1980, when Sony announced its 3½-in. drive and diskettes. Rather than follow Sony, other companies developed different size drives. Last year, four sizes — 3-in., 3¼-in., 3½-in. and 4-in. — were available to manufacturers.

The 3-in. drive is backed primarily by Japanese companies, including Hitachi Ltd. and Matsushita Electric Industrial Co. Tabor Corp. designed the 3¼-in. drive and signed OEM license agreements with Seagate Technology, Inc. and Micro Peripherals, Inc. IBM announced a 4-in. drive, but last summer dropped plans to produce it.

The non-3½-in. formats have had limited market success. Gavilan Computer Corp. planned to use a 3-in. drive from Hitachi Ltd. for its portable computer. However, it recently dropped the 3-in. drives and switched to a Shugart Associates, Inc. 3½-in. drive.

"When we were designing the computer, no standard had emerged," said Vicki Daniel, a Gavilan spokeswoman. "Our portable could use 3-in., 3¼-in. or 3½-in. drives. Hitachi did not meet our shipment request. Since the 3½-in. drive was emerging as a standard, we decided to use the Shugart drive."

The 3½-in. drives have had more success luring major manufacturers. In July, Hewlett-Packard Co. became the first major manufacturer to use a micro floppy drive in a microcomputer. "Hewlett-Packard gave the product the legitimacy which it was lacking," Christiansen said. "Since [HP] is known for superior products, other manufacturers began looking at quality 3½-in. drives rather than marginal 5¼-in. drives."

MICRO BITS/PAUL GILLIN

IBM micro plans: considering the Pick option

With the incredible amount of activity in the microcomputer software market in just the past month, speculators are having a field day trying to figure out what IBM has planned next for the Personal Computer.

Big Blue can be expected to make about 450 workstation-related announcements in 1984, according to one industry source. And among these announcements there will no doubt be several operating systems.

Certainly a new version of Unix is in the offing, as is an optimized version of VM on the "4301" high-end micro. Sources say a third operating system is in the works based on a mainframe model and taking advantage of multiple parallel processors based on Intel Corp.'s 80286 or 80386 32-bit microprocessor.

One of the more interesting speculations to date comes from Strategic, Inc. President Michael Killen. He believes IBM just might pull the rug out from under the speculators and endorse Pick & Associates, Inc.'s Pick, a quiet operating system that nevertheless has won a large corps of dedicated followers. Microdata Corp. had been the sole remarketer of Pick for many years before its falling out with the system developers in 1980. Pick is now offered by a number of major OEMs and hardware vendors, including Ultimate Corp.; Applied Digital Data Systems, Inc.; Altos Computer Systems, Inc.; Datamedia Corp.; and Cosmos, Inc.

Cosmos has developed a version of Pick for the Personal Computer that runs on top of IBM's PC-DOS yet is still able to run many Pick programs with the proper modifications. IBM's Boca Raton, Fla., laboratory is known to be evaluating a copy of the Cosmos package.

Why should Pick emerge from nowhere to capture IBM's heart? The operating system is often compared to Unix by virtue of the fact that both are portable across a range of hardware, and neither is considered appropriate in a mainframe environment. Pick enthusiasts say

Micros for DSS fueling opportunities, problems

By Harry J. Regan
Special to CW

The explosive growth of microcomputer technology over the last few years has left an indelible stamp on the way business analysis is performed. What was once little more than a toy is now becoming the preferred vehicle for decision support systems (DSS).

The introduction of more sophisticated hardware with more processing capability is the fuel firing the rapid acceptance and utilization of micros today. Over two-thirds of the micros installed between now and 1990 will be destined for business use.

Two distinct classes of equipment are emerging in the marketplace: the single-user personal or professional computer and the multiple-user office system. While the latter machine may eventually become the workhorse of the office of the future with respect to word processing, data collection, electronic mail and other applications of a more generalized or routine nature, the personal workstation will become the flagship of the decision maker.

Factors that will determine the success of a business analyst's micro installation include:

- The ability to access data on a host computer.
- The ability to link workstations to each other and to shared resources.
- The ease of use of the equipment and software in its particular application.

- The transportability and repeatability of analyses.

This last point is an important consideration for ensuring consistency in business analyses for organizations that have a variety of micro hardware. The results generated on one workstation must agree with those run on another brand or type of micro.

Until recently, the majority of formal DSS has been implemented on remote computing services. But this situation is changing. In fact, the micro-based DSS has become a major competitor with remote computing services for DSS implementation. A recent trend in decision support software involves linking the personal computer with mainframe-based software, providing a "best of both worlds" capability.

There are decided advantages to using micros for DSS. These include:

- The increased productivity of

Molecular offers 30M-byte multiprocessor

SAN JOSE, Calif. — Molecular Computer, Inc. has announced a 16-user, 30M-byte multiprocessor system designed for businesses with moderate user and storage requirements.

The Supermicro 16X features 30M bytes of formatted Winchester disk storage and is expandable up to 90M bytes, according to a spokesman. The system reportedly provides each user with a dedicated application processor based on a Zilog, Inc. Z80A microprocessor and 64K bytes of random-access memory (RAM); processors are also available with an optional 16-bit Intel Corp. 8086 processor with up to 1M byte of RAM.

The product reportedly is compatible with Digital Research, Inc.'s CP/M 80, CP/M 86, MP/M 80 and MP/M 86 operating systems and features Molecular's N/Star multiuser network operating system.

All application processors are connected to the system's M/Bus high-speed interprocessor link, which operates with a data transfer rate of 400K byte/sec and can support 18 application processors of either 8-bit or 16-bit configuration, according to the spokesman.

The basic system configuration includes a 30M-byte, 8-in. Winchester disk drive; a 1M-byte dual-sided, double-density, 8-in. floppy disk drive; a Zilog Z80B-based file processor with 256K bytes of RAM; N/Star; and M/Bus. The configuration costs $14,995, and 8-bit application processors are available for $995 each.

Options include a 16-bit application processor for $2,795, a 20M-byte tape backup unit for $2,995 and two additional 30M-byte Winchester disk drives priced at $9,995 for the second drive and $7,995 for the third drive.

Molecular's Application Tools for Office Management integrated word processor, spreadsheet and electronic mail package is available for $1,395 from Molecular Computer, 251 River Oaks Pkwy., San Jose, Calif. 95134.

Small business seen expanding computer use

By James Gosselin
CW Staff

NEW YORK — Computer usage by small businesses will jump by 47% in the 12 months ending June 30, with the sales concentrated in those companies with less than 20 employees, according to a study released by *Time* magazine.

The study, "Small Computers for Small Business," showed that 16%, or 566,000, of America's 3.5 million small businesses were using computers at the time of the telephone survey during the first half of 1983. These figures represented a 25.5% increase in market penetration over a three-year period. A small business was defined as one having 500 or fewer employees or sales of less than $25 million.

The projected growth between mid-1983 and mid-1984 was calculated at 47%, or 246,500 new acquisitions and upgrades.

"Retailing apparently will be the hottest market, with 31% of new installations vs. a current 16% share — growing at almost double the industry rate. New sales will continue to be concentrated in the gigantic marketplace made up of companies with less than 20 employees," said the study, produced for *Time* by Focus Research Systems, Inc. of West Hartford, Conn.

The study, which compared the 1983 market penetration to figures for the end of 1979, found that Apple Computer, Inc. led IBM in sales by 2%, but that IBM led Apple slightly in existing installations.

Small businesses were buying more than half of their systems from Apple, IBM, Radio Shack, Digital Equipment Corp. and Commodore Business Machines, Inc., according to the survey.

The size of a business determined the likelihood of computer use, according to the study, with a 70% market penetration in companies with 100 to 499 employees and only 5% penetration in companies with four or less workers.

Geography also influenced market penetration. Southern cities, Atlanta (18.8%), Houston (18.7%) and Los Angeles (17%) had greater projected penetration than New York (12.6%), Philadelphia (13.4%) and Chicago (15.1%).

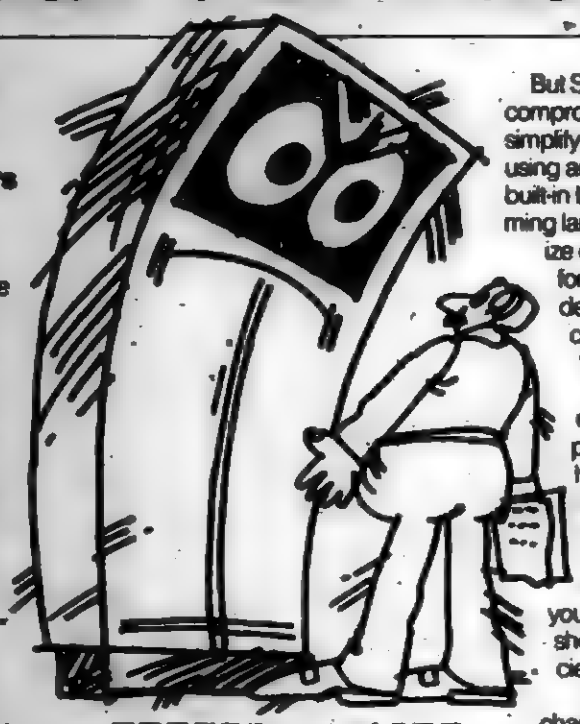
"The pattern seems to indicate that the older markets — Boston (17.4%) being the exception — may be populated with more grass-roots businesses that are resistant to change and innovation, whereas businesses in developing areas — Houston and Atlanta, for example — are quicker to adopt innovative business methods.

"If true, it will mean that more intense selling efforts will be needed in the older cities," the report said.

Boston may be excepted because of its numerous computer and software companies, the researchers said.

The study is available free upon request on company letterhead from Category Sales Supervisor, Time, Inc., Time & Life Building, Rockefeller Center, New York, N.Y. 10020.

Who Really Manages Your VAX Data?



Introducing the DBMS that Users can Use, Programmers can Program, and Managers can Manage.

Most data base users are merely bystanders. Because most data base management systems are so complex that only a few people can squeeze out results.

Now System 1032™ puts the power of the VAX on your side. You get relational data management, without the burden of relational calculus or SQL.

Anyone can use it with less than an hour of training. If you get stuck in the middle of a command, just touch a key. System 1032 prompts for essential information, list choices, or offers a capsule description of any feature.

But System 1032 doesn't compromise on the features that simplify your applications. Design using any host language or our built-in block-structured programming language. You can customize data bases and output formats to satisfy your most demanding users. Yet you can modify any data structures at any time.

Try it out on your own computer. A 60-day trial period costs just $85. See how easily System 1032 manages your own data, on your own system. Test our responsive hot-line support services. Watch your programmer productivity shoot up, and system efficiency accelerate.

Show your VAX who's in charge, with System 1032. Send in the coupon or call today.

Now you don't have to be rich to be powerful.

Riches and power don't always go together. Take Plexus, for instance. The world's most powerful UNIX*-based supermicros.

Powerful because multiple processors share the UNIX load. So processing power is distributed to where it does the most good.

Terminal I/O. Disk I/O. Data communications. And, of course, data processing.

Our unique architecture also lets us bring you the world's first UNIX Network Operating System (NOS). So you can combine Plexus systems in an Ethernet network for even more power.

NOS gives you real time, continuous access to files. From anywhere in the network.

Files are also updated on the same basis. So everyone in the network works with up-to-the-minute data. Automatically.

No waiting for file transfers. And that's a decided improvement over everything else that's out there.

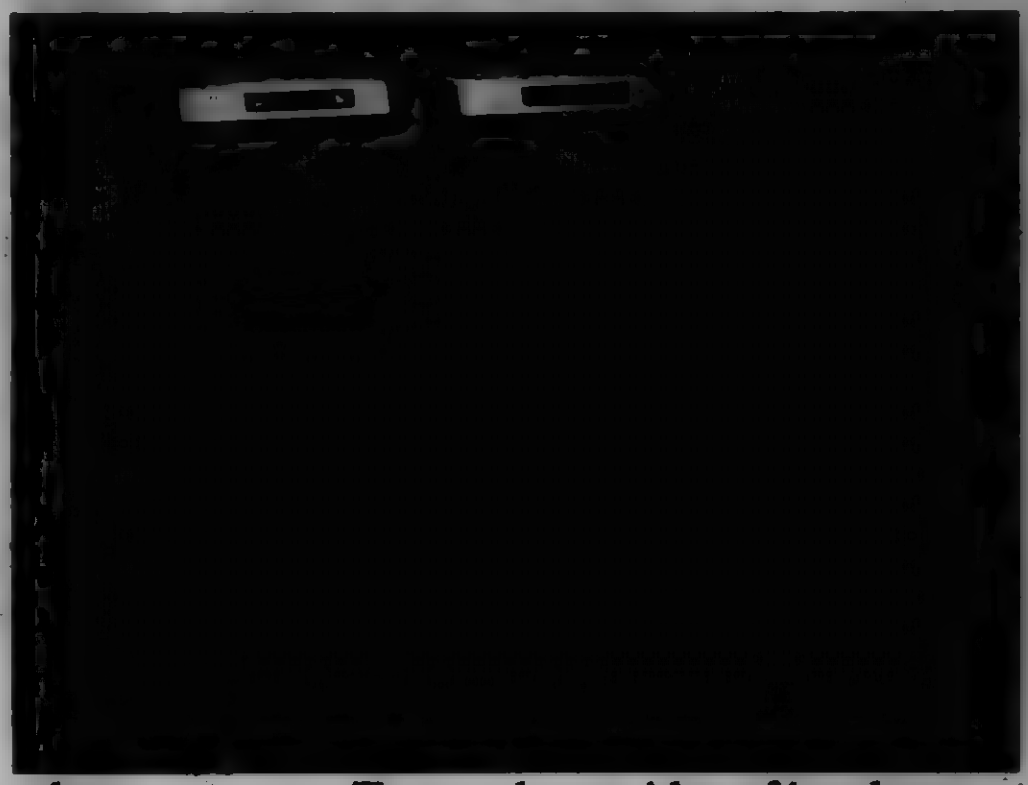
You also get to save money on powerful UNIX-based software, including COBOL, FORTRAN, Pascal, BASIC, and C. Database management and word processing, too. As well as hundreds of third party UNIX packages.

Plus our own software and maintenance support. And even a software referral service for your OEM programs.

Does all this make us expensive?

Absolutely not.

In fact, Plexus systems cost thousands of dollars less than the minicomputers we outperform.



To get a better idea of just how good that performance is, come get a demonstration. Call *800-528-6050*, ext. *1444*. In Arizona, *800-352-0458*, ext. *1444*. Or write Ralph Mele at Plexus Computers, Inc., 2230 Martin Avenue, Santa Clara, CA 95050.

You see? You don't have to be rich to be powerful. Just smart.

PLEXUS

Built for speed.

Apple announces high-speed dot matrix printer

CUPERTINO, Calif. — Apple Computer, Inc. has announced a dot matrix printer designed for reproducing high-resolution graphics at fast speeds.

The Imagewriter is compatible with the Lisa and Apple II and III personal computers and prints high-resolution graphics at a rate of up to 180 char./sec and full text up to 120 char./sec. It uses bit-mapped graphics technology to support Lisa's graphics capabilities.

The printer uses a standard RS-232C serial interface to connect directly with the Apple III's or Lisa's built-in serial ports. Apple's Super Serial Interface Card connects the printer to the Apple II+ or IIe.

The Imagewriter prints in a 7- by 9-dot matrix and features eight fonts. Users can design up to 175 additional characters. Various fonts, underscoring and sub- and superscripts can be mixed in the same printed line.

The new printer provides variable resolution from 72 to 160 dot/in., variable pitch from 10 to 17 char./in., variable line spacing from 1/6 to 1/44 in. and proportional fonts and spacing.

The Imagewriter uses either friction-feed or adjustable-width pin-feed tractors and accommodates a range of paper widths from 3 to 10 inches. It uses single sheets of paper, fan-fold continuous forms, roll stock and precut labels. Up to four copies can be printed at a time.

The Imagewriter is priced at $675 with a 90-day warranty from the vendor. Apple is located at 10260 Bandley Drive, Cupertino, Calif. 95014.

S1 supports up to 256 processors

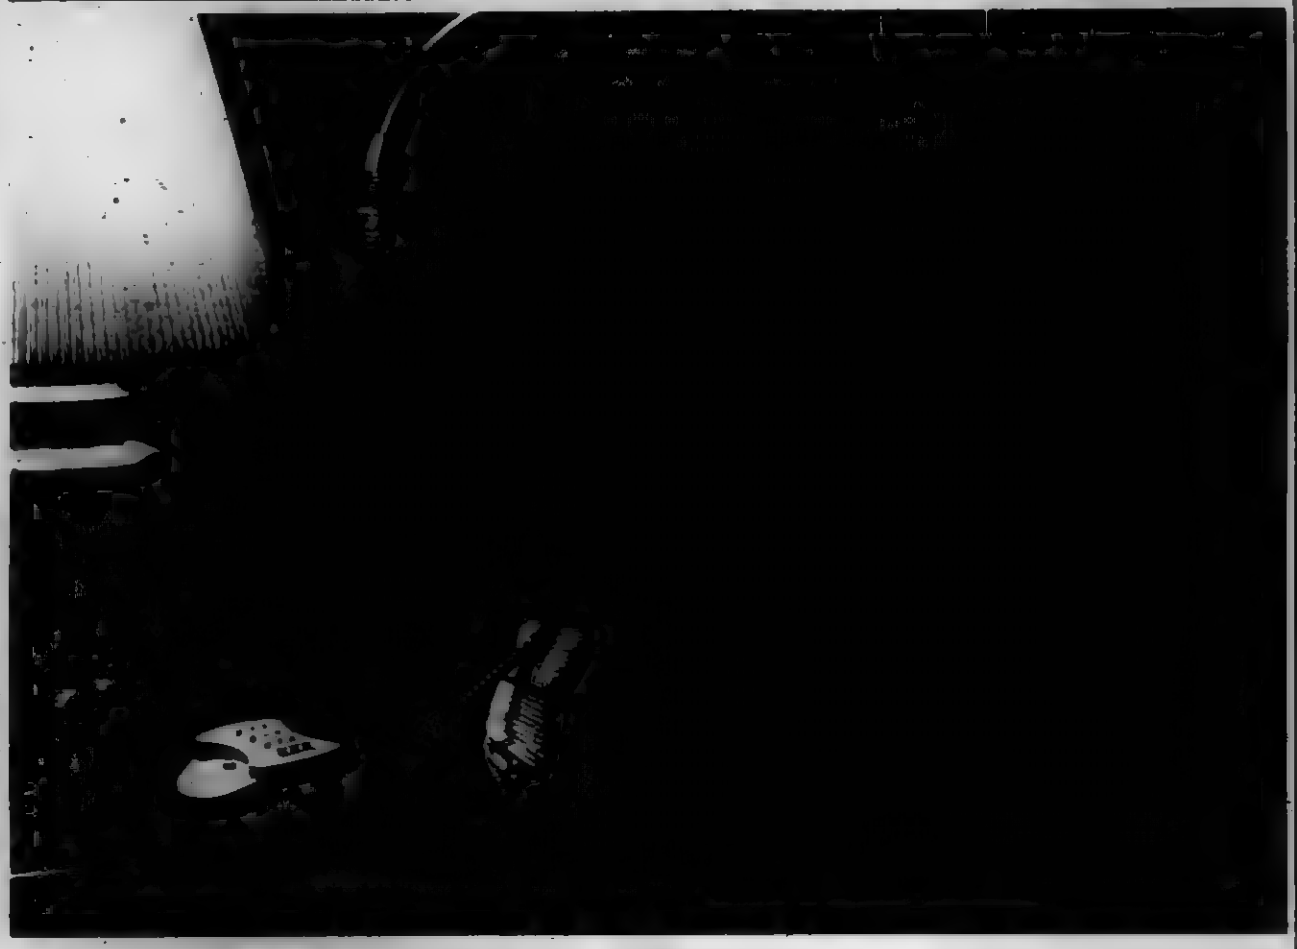
LAWRENCEVILLE, N.J. — Multi Solutions, Inc. recently announced S1, an operating system designed for a variety of microprocessors and said to offer extensive networking support and simultaneous support for up to 256 processors.

Currently available for use on Motorola, Inc.'s 68000, Zilog, Inc.'s Z80 and Intel Corp.'s 8080, 8085, 8086 and 8088 microprocessors, the modular S1 requires 128K bytes of memory, but reportedly may be configured to use as little as 2K bytes of memory by eliminating unneeded facilities.

The operating system reportedly can read and write files to and from Unix, Digital Research, Inc.'s CP/M and MP/M 11; Microsoft, Inc.'s MS-DOS and Xenix, Regents of University of California's P-System, Technical System Consultants, Inc.'s Flex, IBM's 3741 and others.

Features include multiuser and multitasking support, multiprocessing support, networking support, full screen or bit-mapped displays, bit-mapped printers, multiple windows and plotter and terminal support. Compilers for a variety of languages are available.

Prices for a preconfigured system range from $200 to $950 from Multi Solutions at 660 Whitehead Road, Lawrenceville, N.J. 08648.



Computer Interruptus

Midnight. And you wish you would be left in the dark. But miles away in the DP Department, a misplaced DD override, an invalid concatenation, or some other equally obscure JCL error brought production to a standstill.

And when the system breaks down, it's you or your staff they call up. Which usually means getting up and getting down there. And after a night like that, how productive will the morning be?

What a waste. If you had the JCLCHECK™ program, you wouldn't have JCL errors, period. None. Zilch. Zero.

Because the JCLCHECK program can catch any and all JCL errors and give you complete, on-line JCL validation and concise error diagnostics. Plus complete documentation on a job stream or entire production system suitable for insertion in the run book. And it can operate under TSO, TONE, ROSCOE or CMS.

Imagine, with no more JCL errors, your programmers can finally concentrate on what you hired them for: writing programs.

So what are you waiting for? Send the coupon or call us at (408) 554-8121 for details. We'll show you how the JCLCHECK program can bring your error detection out of the dark ages, increase production, and eliminate applications backlog. And that'll put you in the spotlight.

I'm frustrated and tired of JCL errors.
☐ Send me details on the JCLCHECK program.
☐ Have a representative call me.

"Why does productivity have to start so early in the morning?"

10,000 CICS Users Said There Had To Be A Better Way . . .

We Gave Them GENER/OL™

Feature for unique feature, GENER/OL is the leader in on-line CICS applications development. This 5-star performer channels on-line technology for maximum productivity, efficiency, and flexibility.

Complete with award-winning documentation and responsive support, GENER/OL offers uncommon software productivity in the Pansophic tradition.

Call us today for the performance of a lifetime!

MICROCOMPUTERS

SYSTEMS

ATV SYSTEMS, INC.
Disk Load Communication Unit

ATV Systems, Inc. has introduced the Disk Load Communication Unit, a turnkey, point-of-sale microcomputer.

The microcomputer uses a Zilog, Inc. Z80 microprocessor, runs Digital Research, Inc.'s CP/M operating system and has 64K bytes of random-access memory. A communications port allows the microcomputer to function as a central processor for a number of cash registers, an emergency backup system to another processor and a distributed processing site, according to the vendor.

The system costs $3,550.

ATV Systems, 2921 S. Dunsier St., Santa Ana, Calif. 92705.

INCOM SYSTEMS, INC.
The Sidekick

Incom Systems, Inc. recently announced The Sidekick, a briefcase-size microcomputer featuring 16K bytes of random-access memory (RAM), 32K bytes of read-only memory (ROM), a data recorder, thermal printer, modem and ac adapter.

The product reportedly provides current information updates in the form of product pricing, inventory control, service support, order entry and electronic mail.

The system reportedly may be expanded with up to two 32K-byte RAM chips, an additional 32K-byte ROM chip and a plug-in 32K-byte RAM disk. Nickel cadmium power packs provide power for up to six hours before a recharge is required, and the ac adapter plugged into an ac source will provide both operation and recharge, according to a company spokesman. It weighs 15 pounds and measures 19.5 in. by 14.5 in. by 5 in.

The basic model is priced at $1,595 and the RAM disk is priced at $395, with add-on RAM and ROM chips priced at approximately $100 per 8K bytes.

Incom Systems, 4801-24th Ave. N.E., Seattle, Wash. 98105.

MICRO STORAGE

INMAC CORP.
New line of diskettes

Inmac Corp. has announced a new line of 5¼-in. Encore floppy diskettes that are compatible with a variety of computers, including those manufactured by Apple Computer, Inc.; IBM; Radio Shack; Digital Equipment Corp.; Control Data Corp; and NCR Corp.

According to the vendor, the diskettes meet Ansi standards, are guaranteed by Inmac for one year and meet or exceed system requirements.

Prices range from $1.59 for 5¼-in. single-sided, single density to $2.99 for double-sided, double-density diskettes in quantities of four 10-disk boxes.

Inmac, 2465 Augustine Drive, Santa Clara, Calif. 95051.

SYSTEMS PERIPHERALS CONSULTANTS
Diskitjr; Winchester subsystems

Systems Peripherals Consultants recently announced a 10M-byte hard disk drive for the IBM PCjr, Sanyo Corp. MBC-550 and other small micros.

The Diskitjr's chassis is 2¼ in. high, 6 in. wide and 12 in. deep. It includes a half-high plated media drive with up to 40M bytes of storage. A second version provides 5- or 10M bytes on a removable cartridge, a spokesman said.

The Diskitjr sells for $1,495.

The vendor also introduced several models of Winchester disk drive subsystems featuring from 10- to 40M bytes of fixed media storage combined with a 5M-byte removable cartridge Winchester disk.

The Diskit Combo is compatible with all systems running Microsoft, Inc.'s MS-DOS 2.0 and some running MS-DOS 1.0, the spokesman said.

Prices start at $1,395 for the 5M-byte removable-only system and $2,795 for the 15M-byte fixed/removable version.

Systems Peripherals Consultants, 9747 Business Park Ave., San Diego, Calif. 92131.

COMPUPRO CORP.
H40 Hard Disk Subsystem

Compupro Corp. has announced a 40M-byte hard disk subsystem, including an 8-in. floppy drive for use with its IEEE 696/S-100 bus-compatible microcomputer systems.

The H40 Hard Disk Subsystem features a Quantum Corp. Q540 5¼-in. hard disk, Compupro's Disk 3 DMA disk controller and the Digital Research, Inc. CP/M 80 and CP/M 86 operating systems. All models of the Compupro System 816 product line support the new system.

A double-sided, double-density Qume Corp. Trak 842 floppy disk drive is standard with the subsystem, with 2.4M bytes of storage and the ability to accept single or double-density, single or double-sided media. The subsystem is priced at $5,495.

Compupro, 3506 Breakwater Court, Hayward, Calif. 94545.

BOARD-LEVEL DEVICES

PHAZE INFORMATION MACHINES CORP.
Brigitte

Phaze Information Machines Corp. has introduced a coaxial interface

MICROCOMPUTERS

board for use with IBM Personal Computers. Called Brigitte, the board enhances the Personal Computer with IBM 3278 terminal capabilities by bridging a Personal Computer to a 3270 network, the vendor said.

A Personal Computer can reportedly connect directly to the IBM 4331 mainframe and IBM 3274 or 3276 controllers to access mainframe data.

Brigitte reportedly plugs into any open Personal Computer option slot, and, in conjunction with the included software, provides for instant 3278 replacement. No additional modems or communications devices are necessary, the vendor said.

Brigitte is priced at $1,255 for single units.

Phase Information Machines, 7850 Redfield, Scottsdale, Ariz. 85260.

LINDGREN ASSOCIATES
RAM Disc Card, package

Lindgren Associates has introduced a line of add-on random-access memory (RAM) cards said to offer from 64K to 256K bytes of additional on-line memory for the Commodore Business Machines, Inc. Commodore 64 microcomputer.

According to the vendor, the RAM Disc Cards can be used for data storage during computation, appending a Basic program from standard disks or executing more than one Basic program directly from the keyboard.

A RAM Disc package is also available. It includes the vendor's RAM Disc memory board with a battery backup, two software packages and a two-slot expansion interface that enables autostart cartridges to use the RAM Disc Card, the vendor said.

A 64K-byte Ram Disc is priced at $370, and each additional 64K bytes of RAM cost $70.

Lindgren Associates, 127 Main St., Brattleboro, Vt. 05301.

TSENG LABORATORIES, INC.
Ultrapak

Tseng Laboratories, Inc. has announced Ultrapak, a graphics and memory expansion board for the IBM Personal Computer.

The board features a parallel port, a serial port and a battery-powered clock and calendar, according to the vendor. Compatible with Lotus Development Corp.'s Lotus 1-2-3, Ultrapak includes 64K bytes of memory, support for 720- by 348-pixel graphics resolution and two pages of bit-mapped graphics, the vendor said.

The board costs $795.

Tseng Laboratories, P.O. Box 588, Newtown, Pa. 18940.

I-BUS SYSTEMS, INC.
I-Bus R188

I-Bus Systems, Inc. has announced a board-level microcomputer system based on the IBM Personal Computer bus structure.

The I-Bus R188 single-board computer is said to allow expansion, with numerous add-on boards available for the Personal Computer. The vendor also offers I-Bus system packaging, including a six-slot chassis enclosure and a nine-slot card cage.

The system uses an Intel Corp. 80188 processor operating at 4.77 MHz and reportedly is upward compatible with software written for the Personal Computer's Intel 8088 processor.

The R188 board includes the processor, 64K bytes of random-access memory, up to 160K bytes of user erasable programmable read-only memory and an RS-232C serial console port.

It is priced at $795 for the computer and $395 to $695 for cages and enclosures.

I-Bus Systems, 9235 Chesapeake Drive, San Diego, Calif. 92123.

AUXILIARY EQUIPMENT

QED INFORMATION SCIENCES, INC.
PC Plus

QED Information Sciences, Inc. has introduced PC Plus, an interactive course designed to run on the IBM Personal Computer, Personal Computer XT and PCjr.

It reportedly teaches users how to operate the Personal Computer, computing fundamentals and the major applications of personal computers, such as word processing, electronic spreadsheets and data base management.

PC Plus modules and hands-on exercises describe and explain system components, storage of records and files, how to operate the keyboard and commonly used computer terms, according to the vendor.

PC Plus, which includes six modules as well as a dictionary, is now available to run on the Personal Computer and Personal Computer XT and costs $59.95.

QED, P.O. Box 181, Wellesley, Mass. 02181.

COMPUTER RESOURCES CORP.
Epson HX-20 parallel port interface

A parallel port interface for the Epson America, Inc. HX-20 notebook-size computer was recently made available from Computer Resources Corp.

The interface unit is said to provide 24 parallel bits of fully buffered input, output or bidirectional data that is user-configurable in 8-bit segments.

In addition, up to 16 parallel port boards can be daisy chained off the expansion connector of one HX-20, according to a spokesman for the company.

The cost of the parallel board is $250, while the connector/LED board is priced at $125 for red LED and at

1."How can I be sure I'm getting the latest technology?" At GE, we're a *technology company.* So we have the technical overview to be familiar with major data communications developments. Plus the resources to analyze every piece of equipment we consider leasing to you. So you not only get the *latest.* You get the *best.*

2."How can I be sure I'm getting the right equipment for me?" We will help you analyze your need and likely growth pattern. Then help you decide on the equipment that's right for *you,* from a number of the industry's top manufacturers—like Micom, General DataComm, and IBM, to name a few.

3."How can I be sure I'll get the service I need—when I need it?" General Electric's nationwide service network is just a phone call away. Over 60 locations, with the people *and* parts you need—which usually adds up to *same-day* response.

We even carry the little stuff, like ribbon, paper, cassettes and disks—to save you valuable space.

4."How can I afford it all?" Our leasing alternative helps you conserve capital and credit, eliminate obsolescence, cut overhead, and may give you greater tax advantages than buying.

And with General Electric's service network *behind* the lease, you can minimize downtime—adding up to what may be the best *value* in the business.

GENERAL ELECTRIC.

5."How do I stop worrying?" Call us. We have the answer to practically *any* data communications question—your one-source solution, with the equipment, know-how, service, leasing—and the *security* that comes from dealing with GE.

For the phone number of the sales center nearest you, call 800-528-6050, Extension 406. (In Arizona, 800-352-0458, Extension 406.) Or write General Electric Company, Communication Leasing and Service, Building 4, Room 210, Schenectady, New York 12345.

$145 for two-color LED, the spokesman said.

Computer Resources, P.O. Box 388, Provo, Utah 84601.

SOFTWARE DIGEST, INC.
'Rating Newsletter'

The first issue of 'Rating Newsletter,' published by Software Digest, Inc., evaluates 30 word processing programs that run on IBM's Personal Computer. Each program was tested by 10 reviewers with various levels of computer experience. Evaluation focused on ease of use, performance, versatility and value for money.

Software Digest plans to evaluate nine other types of software packages in future issues of 'Rating Newsletter.' An annual subscription to the newsletter costs $135.

Software Digest, One Wynnewood Road, Wynnewood, Pa. 19096.

MICRO SOFTWARE

LINDBERGH SYSTEMS
Omniterm 2

Lindbergh Systems has introduced Omniterm 2, an intelligent terminal communications package for the IBM Personal Computer and compatible machines.

Omniterm 2 is a revised version of the Omniterm program for Radio Shack's TRS-80. Both products operate through a command-mode menu in which all communications parameters are grouped in logical categories.

According to the vendor, Omniterm 2 was designed for business and professional users. A scroll-back feature allows the user to view text that has been received, but has scrolled off the screen. DOS files can be viewed and edited in a similar manner while remaining connected to the remote system.

Priced at $245, Omniterm 2 comes with documentation, keyboard overlay, an on-line help function and free telephone support.

Lindbergh Systems, 49 Beechmont St., Worcester, Mass. 01609.

CAMBRIDGE COMPUTER CORP.
PC77/78; PC72/73

Cambridge Computer Corp. has introduced software products for the IBM Personal Computer and Personal Computer XT which allow them to emulate Honeywell, Inc. terminals.

Using PC77/78, the Personal Computer emulates the Honeywell VIP 7700 and VIP 7800 series of synchronous terminals; with PC72/73, the Personal Computer emulates the Honeywell VIP 7200 and VIP 7300 series of asynchronous terminals.

The IBM micro reportedly emulates Honeywell terminals without host system or application software modification, regardless of the operating system.

A file transfer utility is also available, allowing the end user to transfer files between the Personal Computer and Honeywell host computers.

The PC77/78 is priced at $795, and the PC72/73 costs $395. The file transfer utility is priced at $150.

Cambridge Computer, 151 Bender Road, Mount Carmel, Conn. 06518.

TARRTEC INTERNATIONAL, INC.
Name directory

Tarrtec International, Inc. has introduced a data base management system (DBMS) capable of storing 2,000 records on a single disk.

The name directory produces mailing labels and record lists according to user-defined catalog codes or geographically by area codes, states, Zip Codes or partial Zip Codes. Each record contains a field for two names, street address, city, state and Zip Code, phone and catalog code.

The DBMS can search record groups for names, catalog codes or record numbers. Utilities allow reading or printing of all current catalog codes, changing access key, selecting minimum and maximum record range and producing multiple mail labels of individual records.

The minimum requirements for running the program are an IBM Personal Computer XT running under DOS with 16K bytes of random-access memory, one disk drive and a printer. The list price is $40.

Tarrtec, P.O. Box 81, Commack, N.Y. 11725.

CLARITY SOFTWARE CORP.
3-2-1 Go

Clarity Software Corp. has introduced 3-2-1 Go, a program that converts Lotus Development Corp.'s Lotus 1-2-3 work sheets into models for an interactive financial planning system.

The program allows Lotus 1-2-3 users on IBM Personal Computers or compatible micros to create models for use as input to Execucom Systems Corp.'s Interactive Financial Planning System (IFPS)/Personal. In addition, models and data files for the mainframe version can also be produced.

The product runs on the Personal Computer under the PC-DOS 1.1 or 2.0 operating system, and requires 96K bytes of memory and two disk drives.

Capabilities include arithmetic expressions, row and column summations and previous and future column references.

Unlimited use within an organization, including copying for multiple in-house personal computer usage, is permitted under a license from Clarity Software. The license fee for 3-2-1 Go is $2,000.

Clarity Software, 11103 Spicewood Pkwy., Austin, Texas 78750.

Announcing

The one-stop, international advertising service for micro marketers.

You'll reach microcomputer buyers all over the world with *Computerworld's* International Marketing Services (CWIMS). Because we have the microcomputer market *covered* with an international network of publications. And what a market!

As the need for computerization in government, industry and educational systems all over the world becomes more acute, countries look to the cost-effective, adaptable microcomputer to bring them into the computer age. This means a very lucrative market for the U.S. micro marketer, since international product demand exceeds product supply.

Now, with the help of *Computerworld's* International Marketing Services, you can advertise in seven magazines devoted exclusively to supplying information to microcomputer users in: Australia *(MicroWorld)*, Brazil *(Micro-Mundo)*, Denmark *(Micro Verden)*, Finland *(Mikro)*, France *(Golden)*, Japan *(PersoCom World)*, Norway *(Mikro Data)*, Sweden *(MickoDatorn, Min Hemdator)*, Spain *(Micro Sistemas)*, The Netherlands *(Micro/Info)*, West Germany *(MicroComputerwelt, PC Welt)*. And, your advertising message can reach buyers of microcomputer products and services around the world through special micro sections in any of our 40 publications in 25 countries.

Act now—and take advantage of this international demand for microcomputer products. Whether you want to test the market—or locate a distributor or representative—our publications will put you in touch with the right people around the microcomputer world.

For more information on getting international micro coverage, call Diana La Muraglia, General Manager, International Marketing Services, toll-free, at 800-343-6474. In Massachusetts, call 617-879-0700 or return the coupon below.

YOU BUY ALL YOUR SYSTEMS SOFTWARE FROM ONE COMPANY FOR THE SAME REASON YOU BUY ALL YOUR SUIT FROM ONE TAILOR

There are thousands of software companies. Each of them can sell you a little of this ... and a little of that. And, what have you got? One package that does a little of this ... and another package that does a little of that. And that's all!

But there is one software company that has the software — and the expertise — to help you gain total control of entire operating areas. UCC.

With over 6000 systems installed, UCC is the most experienced software company in the world. Our products have set the standards for dataset management, production workload management, data center management and DOS to OS conversion.

And, more than anything else, with UCC Systems Software: you can handle growth. Plan for it. And manage it.

The UCC-1 Tape Management System

The most widely used tape management system in the world. Now, over 2,400 OS data centers are getting assured protection for their tapes.

UCC-1 eliminates data losses. Improves operating productivity. And solves the problem of tape protection. Completely.

UCC-1 effectively manages all your tapes, preventing accidental loss or destruction of valuable data. And it gets rid of those inefficient handwritten records — along with the costly mistakes they breed.

The UCC-2 DOS Under OS System

All you need to convert to OS ... the easy way! Because, with UCC-2, you can run under OS *without* converting DOS programs.

UCC-2 makes it possible to move the entire DOS workload to an OS environment ... without converting any DOS programs to OS. You get to OS more quickly, easily, and efficiently than ever before ... and hold your conversion costs to the minimum. Over 1,000 data centers have already proven UCC-2 is the best way to get to OS.

The UCC-20 OS JCL Generator

Now, you can create OS JCL ... automatically. And, UCC-20 — together with UCC-2 — makes the transition to OS even easier.

UCC-20 allows you to quickly produce fully functional OS JCL ... without having extensive OS knowledge or training. Plus, your JCL will match *your* predefined standards. Best of all, UCC-20 automatically handles syntax, keyword, and punctuation requirements — both simple and complex.

The UCC-3 Disk Management System

It can increase your usable DASD space by a *third!* And it eliminates DASD problems that cost you time and money.

UCC-3 recovers disk space automatically. It ends space waste ... ends fragmentation, over-allocation, retention of obsolete data sets, inappropriate data set placement.

Data is migrated in minutes ... instead of hours.

What's more, it fully protects your valuable data during use, during back-up, during compression, and during migration. Automatically.

The UCC-6 PDS Space Management System

It eliminates costly PDS compression ... completely. And it helps you avoid most other PDS-related problems.

UCC-6 automatically controls and inventories the members within PDS. This means you get more efficient use of existing disk space. And avoid unnecessary ABENDS. UCC-6 offers security and automatic back-up at the member level. Plus, it prevents processing delay by allowing multiple jobs to update the same PDS simultaneously.

The UCC-7 Automated Production Control System

The ultimate tool for realtime, automated control of your entire production job processing. From automatic scheduling and submission of jobs ... to tracking receipt of data and distribution of output.

UCC-7 is the only system with dynamic feedback ... it's self-adjusting and warns you of potential delays. You get continuous workload balancing for the most efficient use of your hardware resource. Plus, it gives you centralized information for all work areas — Data Preparation, Scheduling, Operations, and Distribution.

The UCC-8 Data Center Management System

It helps you efficiently control all support and service activities ... throughout the data center. With one online, integrated package.

UCC-8 provides management support for your entire company — as well as for your data center. You can instantly monitor the immediate status of every project in your shop ... determine priorities and assign responsibilities for every project ... control equipment and procedural changeovers ... and identify the expense associated with each and every problem.

The UCC-9 Hardware Reliability Management System (RELIABILITY PLUS)

The most authoritative information on hardware reliability that's available. Anywhere. Now, both you and your vendors will know what the score really is.

UCC-9 gives you the facts about hardware failure in your data center ... and in over 700 other participating centers. You have the data you need to make wise hardware decisions. And, every day, UCC-9 pinpoints devices that need attention ... before they bring the system down, before they cost you extensive recovery time. Now, preventative maintenance is a reality.

The UCC-10 Data Dictionary/Manager

The only dictionary package that controls the entire IMS environment. Applications ... databases ... data communications ... and message format services.

UCC-10 is a real workhorse in both a development and production environment. It can significantly improve the productivity of your development staff. And assure the integrity of your production system — while enforcing standards and improving security.

In fact, UCC-10 is much more than just a data dictionary. It is the tool for managing and controlling your investment in people and programs.

The UCC-11 Automated Job Management System

The only system that can automatically re-start or re-run any job. From the proper job step. Without manual effort. Without delay. Without error.

Not only that, UCC-11 eliminates whole categories of reruns outright ... they just can't happen. UCC-11 tracks jobs for you. So you know how many reruns occurred, when, where, why, and at what cost in resources. Now you can analyze the problem. And solve it.

Call 1(800)527-8813 ...

... for more information about UCC Systems Software (in Texas, 214/353-7533; in Canada, 416/424-4171).

THE MOST COMPLETE SOFTWARE COMPANY IN THE WORLD

University Computing Company Dallas • Toronto • London • Paris • Dusseldorf

SOFTWARE from page 119

INFOWARE, INC.
Info-Samp 2.0

Infoware, Inc. has introduced a sampling tool for auditors and other professionals for testing random samples of a population.

Info-Samp 2.0's features include random generation of numbers for a sample; calculation of a statistically valid sample size and number of errors allowed (based on a precision level and degree of confidence); work sheet printing; and an option that saves numbers to be printed again later.

The software runs on the IBM Personal Computer or Personal Computer XT under IBM's PC-DOS Release 1.1 or 2.0 operating system.

The menu-driven package is priced at $95.

Infoware, 2536 N. Lincoln Ave., Chicago, Ill. 60614.

D A DATA SYSTEMS
The Retriever

D A Data Systems has announced The Retriever, the first in its line of Tools Times Three systems software for the Apple Computer, Inc. Apple III microcomputer.

The Retriever was designed to restore automatically accidentally deleted files, without knowledge of disk formats or any other details of machine operation. The user reportedly enters the name of the deleted file, and the package restores the file automatically.

The Retriever is available for $100 from Apple dealers or directly from D A Data Systems.

D A Data Systems, 229 Rowenwood Ave., Rochester, N.Y. 14619.

MICROLINE, INC.
DMS-III

Microline, Inc. has introduced DMS-III, a menu-driven data base management system (DBMS) designed to run on any system using either Digital Research, Inc.'s CP/M or Microsoft, Inc.'s MS-DOS operating system.

The operating system must have approximately 300K bytes of disk capacity, which can be located on two drives.

According to the vendor, DMS-III is able to perform complex calculations within the files, yielding spreadsheet results. The capability makes it adaptable for time and billing reports. A free-form report function allows the user to design reports, the vendor said.

DMS-III is formatted for more than 30 microcomputers, the vendor said.

The system retails for $295.

Microline, 1701 W. Front St., Tyler, Texas 75702.

MICRO DATA BASE SYSTEMS, INC.
Kpaint

Micro Data Base Systems, Inc. has introduced an interactive forms painter for use with its Knowledgeman package.

Called Kpaint, it is an optional component to go with each of the seven standard Knowledgeman components for use with the spreadsheet, data manager and programming language.

It allows a user to design or revise forms directly on the screen, with immediate full-color feedback as each addition or change is made.

Knowledgeman runs on the IBM Personal Computer, Personal Computer XT and compatible machines using Microsoft, Inc.'s MS-DOS, IBM's PC-DOS or Digital Research, Inc.'s CP/M 86 and MP/M 86 operating systems.

The menu-driven Kpaint supports nearly all standard aspects of Knowledgeman forms design. The forms can be used for screen I/O and for printer output. Each form design can include blocks of color, adding up to 64 foreground/background color combinations.

Kpaint allows a user to define or change the position, colors and size of any color block. A form design can also contain literal and nonliteral form elements.

With Kpaint, a user can define, move, copy, delete and change elements. Nonliteral elements can be directly mapped from data base fields, spreadsheet cells and/or working variables. Pictures for automatic editing and integrity checking can be specified.

All Knowledgeman features and functions are integrated. The standard system includes a relational data manager, third-generation spreadsheet, ad hoc inquiries, screen I/O management, printed forms management, statistics generator and structured programming language.

The standard Knowledgeman package costs $500. The optional Kpaint is an additional $100.

Micro Data Base Systems, P.O. Box 248, Lafayette, Ind. 47902.

APPLIED DATA RESEARCH, INC.
ADR/Data

Applied Data Research, Inc. (ADR) has announced the availability of ADR/Data, the first product in its Genie series software for the Digital Equipment Corp. Professional 300 series microcomputer.

ADR/Data, a relational data management system, is a menu-driven package that provides the capability of joining up to three data files during a session and can be used for entry, updating, retrieval, manipulation and reporting of information, according to a spokesman for the company.

Other packages planned for the Genie series include ADR/Graph, a full-color business graphics package, and ADR/Stats, a statistical analysis

PREV
BAD

IT SPREADS.

ERODES.
DESTROYS INTEGRITY.

Bad data is really bad news. Because it's impossible to get good information from bad data. And once bad data gets into a system, there is no cure. The bad simply gets worse.

There is only one way to guarantee good information: *PREVENT BAD DATA.*

TSI International can do just that. We're the good information specialists. With software designed specifically to make sure your data starts good and stays good. Our products will capture, control and deliver consistently good data to assure nothing but good information. You can depend on it. No one knows more about how to prevent bad data than TSI.

MICROCOMPUTERS

and forecasting product for business applications.

ADR/Data is priced at $600, with quantity discounts available, the spokesman said.

Applied Data Research, CN-8, Route 206 and Orchard Road, Princeton, N.J. 08540.

HYPERGRAPHICS CORP.
Hypergraphics

Hypergraphics Corp. has developed a color graphics software package for the IBM Personal Computer and compatible units that is said to produce animated graphics in 26 colors.

Hypergraphics was designed to store up to 1,000 color graphics screens on a 320K-byte floppy disk and can be used as an authoring language for computer-assisted tutorials, to create stand-up sales presentations and marketing diskettes or as part of other software programs. It can also pick up a screen from another software package that is buffer-stored and convert it to color graphics, the company said.

Hypergraphics requires 128K bytes of random-access memory and runs on any IBM Personal Computer or compatible system. It also can be used on the Apple Computer, Inc. Apple IIe. It works with most color graphics boards and will interface with color graphics printers, the company noted.

The Hypergraphics package costs $395, including user documentation, tutorial disk and two system disks.

Hypergraphics, 1926 Shenandoah Drive, Denton, Texas 76205.

CROMEMCO, INC.
Cromix Version 20.52

Cromemco, Inc. has introduced a new version of the Motorola, Inc. 68000 microprocessor-oriented Cromix operating system that can support more users than previous versions on a Cromemco D series system, with expanded shell buffers and process tables.

The Cromix 20.52, described by the vendor as a Unix-type system, features a device driver that allows random-access memory (RAM) to act as a disk drive.

The Ramdisk device driver, which is implemented in the software, lets users access disk resources significantly faster in multiuser systems. The Ramdisk is an area of system memory that is set aside during system initialization and can then be used as disk storage.

Up to four disk drives in increments of 64K bytes can be allocated in RAM, up to the full 16M-byte RAM capacity allowed by the 68000 microprocessor.

The Cromix 20.52 has 30 shell buffers and 30 process tables; previous versions were allowed a maximum of 10 shell buffers and 10 processor tables. Up to eight users may use the system simultaneously with up to 16 terminals connected to the system, the vendor said.

The product is available on 514- or 8-in. diskettes for $595. Delivery requires 30 days.

Cromemco, P.O. Box 7400, 280 Bernardo Ave., Mountain View, Calif. 94039.

SOFTECH MICROSYSTEMS, INC.
P-system 8087 software upgrade kit

A P-system 8087 software upgrade kit for the IBM Personal Computer, which is said to enable existing P-system application programs to utilize the Intel Corp. 8087 floating point processor, is available from Softech Microsystems, Inc.

The kit allows existing Softech P-system application programs to use the 8087 without any data file conversion or recompilation, the company noted. There are two upgrade configurations available to coincide with the two P-system products available: the Version IV Development System and the Runtime Support System.

Each kit is priced at $20.

Softech Microsystems, 16885 W. Bernardo Drive, San Diego, Calif. 92127.

WESTFORD SYSTEMS, INC.
Micro-Track

Westford Systems, Inc. has introduced Micro-Track, a program for managing and monitoring IBM Personal Computer usage. Micro-Track provides executives with information on how personal computers are being used and who is using them.

Micro-Track runs under IBM's PC-DOS on the IBM Personal Computer and Personal Computer XT. It requires 64K bytes of memory and an 80-char. display; it costs $295.

Westford Systems, 69 Providence Road, Westford, Mass. 01886.

CENTERPOINT COMPUTER APPLICATIONS
Cad from Centerpoint

Centerpoint Computer Applications has introduced Cad From Centerpoint, a picture-drawing program available for the IBM Personal Computer, Apple Computer, Inc. Apple II family and other processors that use the Digital Research, Inc. CP/M 80 operating system.

The product was designed to run

REPORT WRITER
for DEC computers
under RSTS and VMS

- Very powerful and user-friendly
- Better than DEC's Datatrieve
- Costs much less

etc ENTERPRISE TECHNOLOGY CORPORATION

"If you want to do OEM computer business in the U.S., you'd better go to the Invitational Computer Conferences in Boston, Dallas, Minneapolis, Orange County, Washington, D.C., Los Angeles, Ft. Lauderdale, ...We do!"

Experienced marketing management knows that the best way to reach the technical decision maker/buyer is to meet him where he lives and works, demonstrate operating equipment and provide him with the technical information he needs. Over the past 12 years successful marketers have found the Invitational Computer Conferences to be the most cost-efficient, effective method of covering their U.S. computer industry customer base.

The exclusive, one-day, OEM conferences will be held in ten major market areas throughout the United States and are attended by a select, invited audience of OEM's, systems houses and quantity end users. Guests can attend a variety of technical seminars and view operating displays of the newest computer and peripheral equipment. The informal setting makes it easy to meet with potential customers one-on-one and the simple tabletop displays keep exhibit costs at a minimum.

The PC's are coming!

More professionals will attend FOSE '84 than any other office automation conference and expo in America.

FOSE, the largest and most comprehensive program in the nation, has over 3 acres of exhibits on everything pertaining to the total office environment. See the most extensive and in-depth showing of the latest in personal computers and microcomputer systems and software available anywhere.

A day-long PC hands-on session for all conference attendees will feature PC implementation, integration, software, and graphics. In addition, a two-day PC Center will give attendees the opportunity to see and operate dozens of PC systems.

Don't wait. Don't delay. No need to stand in line. New for FOSE '84 is **preregistration.** Send for details on conference sessions plus list of exhibitors or call toll-free

800-638-8510 or 301-459-8383

on the Hewlett-Packard Co. 7470 and 7475 plotters, Enter Sweet P and Six Shooter plotters, Mannesmann Tally, Inc.'s Pixy 3 plotter, Amdek Amplot II plotter, Houston Instruments and Apple plotters.

According to the vendor, a user can create, store and plot any shape on the plotter. The documentation explains to the user how to draw the desired shape on the grid.

The program is geared for users who need to create custom shapes, designs, logos, diagrams, layouts or schematics with a plotter.

The program costs $149.

Centerpoint Computer Applications, 500 N. Michigan Ave., Chicago, Ill. 60611.

DATAMATE CO.
Enquery

Datamate Co. has announced an English-language report and query generator for the IBM Personal Computer and compatible systems. Called Enquery, the report writer is said to allow selection and display or printing of data fields from existing application files.

Enquery was designed to allow the user to customize a software system without programming. The program understands standard English words and phrases and automatically formats the report for the user. In addition, Enquery can access existing data files without converting them to a data base, the company said.

Enquery can be used with any computer using Microsoft, Inc.'s MS-DOS or IBM's PC-DOS operating system using RM/Cobol. The Cobol compiler is required for the custom dictionary feature.

The typical price for Enquery, with dictionaries for standard applications, is $950. The customizer option is an additional $500.

Datamate, Department CWB3, Suite 128, 4135 S. 100th East Ave., Tulsa, Okla. 74146.

BMDP STATISTICAL SOFTWARE, INC.
Statcat software package

BMDP Statistical Software, Inc. has announced a 40-program package for data analysis on the firm's Statcat microcomputer.

The 1983 release of BMDP Statistical Software is designed to provide flexible statistical procedures for novices and experienced statisticians and data analysts.

Programs reportedly include data description and screening, linear and nonlinear regression, frequency counts and table analysis, multivariate techniques, nonparametric tests, time-series analysis and additional special techniques.

The software package is now available for lease. There is a one-time, first-year, installation fee of $500 and an annual fee of $50/program with a minimum of 10 programs in a package.

BMDP Statistical Software, 1964 Westwood Blvd., Los Angeles, Calif. 90025.

PRO COMPUTING, INC.
Propel

Pro Computing has introduced Propel, an integrated communications and data and word processing package designed for the Digital Equipment Corp. Professional 350 microcomputer.

The package consists of eight modules: telephone directory with automatic dialing, phone call notebook, answering and message service, word processing, electronic mail, meeting and reading notebooks, spreadsheet and graphics. The package features dedicated function keys, preformatted applications and an on-line Help key for each screen, according to the vendor.

The package runs under DEC's P/OS operating system with 512K bytes of random-access memory.

All eight modules cost $1,195; without the three phone modules, the package costs $950.

Pro Computing, Suite 3314, One Penn Plaza, New York, N.Y. 10119.

ADVANCED SYSTEMS, INC.
Microtutor

Advanced Systems, Inc. has announced a diskette-based computer literacy course for the IBM Personal Computer, the Apple Computer, Inc. Apple II and other microcomputers.

Microtutor reportedly teaches personal computing literacy and applications skills on specific software. It was designed to help management personnel and staff understand and use application software, including financial planning, data base management, word processing, programming, accounting and operating systems.

The company reports that Microtutor is available now for more than 20 popular application software programs.

The price for Microtutor is $80/course.

Advanced Systems, 3340 S. Arlington Heights Road, Arlington Heights, Ill. 60005.

COMPUVIEW PRODUCTS, INC.
Systran

Compuview Products, Inc. has announced a utility program designed to move data between operating systems on the IBM Personal Computer and other microcomputers.

Systran reportedly moves data between Microsoft, Inc. MS-DOS and Digital Research, Inc. CP/M operating systems. It is said to produce readable MS-DOS disk formats from CP/M disk formats. The package is also said to convert data files from CP/M to MS-DOS structures, including MS-DOS 1.1 and 2.0. MS-DOS is not needed on the system, according to the company.

Systran is said to run under Digital's CP/M 86 on the IBM Personal Computer or most other computers using the Intel Corp. 8086 microprocessor.

The Systran disk and manual are available now at a price of $120.

Compuview Products, 1955 Pauline Blvd., Ann Arbor, Mich. 48106.

INTEGRATED SOLUTIONS, INC.
Unix 4.2 BSD

Integrated Solutions, Inc. has announced that its version of the Unix operating system, 4.2 BSD, is available on the company's Motorola, Inc. 68010-based CPU cards.

The vendor said this release of the University of California at Berkeley's 4.2 BSD version of Unix features a fast file system for gains in file system throughput and support for the Defense Advanced Research Projects Agency standard commun-

MICROCOMPUTERS

lication protocols as well as higher level application protocols.

A multiuser license for the Unix 4.2 BSD is priced at $1,395, and a single-user license is priced at $995, according to a spokesman for the vendor.

Integrated Solutions, 1960 Dell Ave., Campbell, Calif. 95008.

REALIA, INC.
Termulator; Spacemaker

Two utility programs for the IBM Personal Computer — a Digital Equipment Corp. VT100 terminal emulator and a file compressor — have been announced by Realia, Inc.

Termulator, a VT100 emulator, interprets all features of the VT100 terminal including the VT52 escape code sequence recognition. In addition, Termulator handles transmission and reception of files, retains the IBM Personal Computer color and graphics capabilities and allows key redefinition. It can be used at transmission speeds up to 9,600 bit/sec, the company said.

Spacemaker is a utility program used to compress executable files on the Personal Computer and run on IBM's PC-DOS operating system Versions 1.1 and 2.0.

Termulator is priced at $95, while Spacemaker costs $75.

Realia, 10 S. Riverside Plaza, Chicago, Ill. 60606.

PERICOMP CORP.
Superfile Backup

Pericomp Corp. has announced the Superfile Backup package designed to back up Digital Research, Inc. CP/M or Microsoft, Inc. MS-DOS operating system files of any size, in hard disk or floppy disk formats.

The menu-oriented package allows user selection of such functions as disk changes, copying, retrieving and purging. Proper file sequence on recovery is enforced by prompts, the company said, and the package will not accept diskettes out of sequence. In addition, backup files are read-only.

A Superfile Backup directory provides listings of files and file segments on each backup diskette.

Superfile Backup is priced at $49.95, with quantity discounts available.

Pericomp, 14 Huron Drive, Natick, Mass. 01760.

RADIO SHACK
Micro Color Compac

Radio Shack has introduced the Micro Color Compac, a program that is said to allow its TRS-80 Micro Color Computer Model MC-10 to communicate by telephone with information services such as Compuserve Information Service or Dow Jones information.

Micro Color Compac is a machine language program on cassette tape that gives the user access to news, weather, sports, electronic mail and personal computing services offered by Compuserve, as well as the current market quotes, financial statistics and transcripts of the Public Broadcasting Service television program *Wall Street Week*, information that is available to the Dow Jones service's subscribers.

Communications protocols are set by the user, but the setting must match those of the computer system with which the MC-10 is communicating. Protocol options include communications rates of 110, 300 or 1,200 bit/sec; half or full duplex; word length of 7 or 8 bits; automatic line feed on or off; and text display of either upper and lowercase or uppercase only.

The program costs $29.95 and is available through Radio Shack computer centers and dealers.

Radio Shack, 1800 One Tandy Center, Fort Worth, Texas 76102.

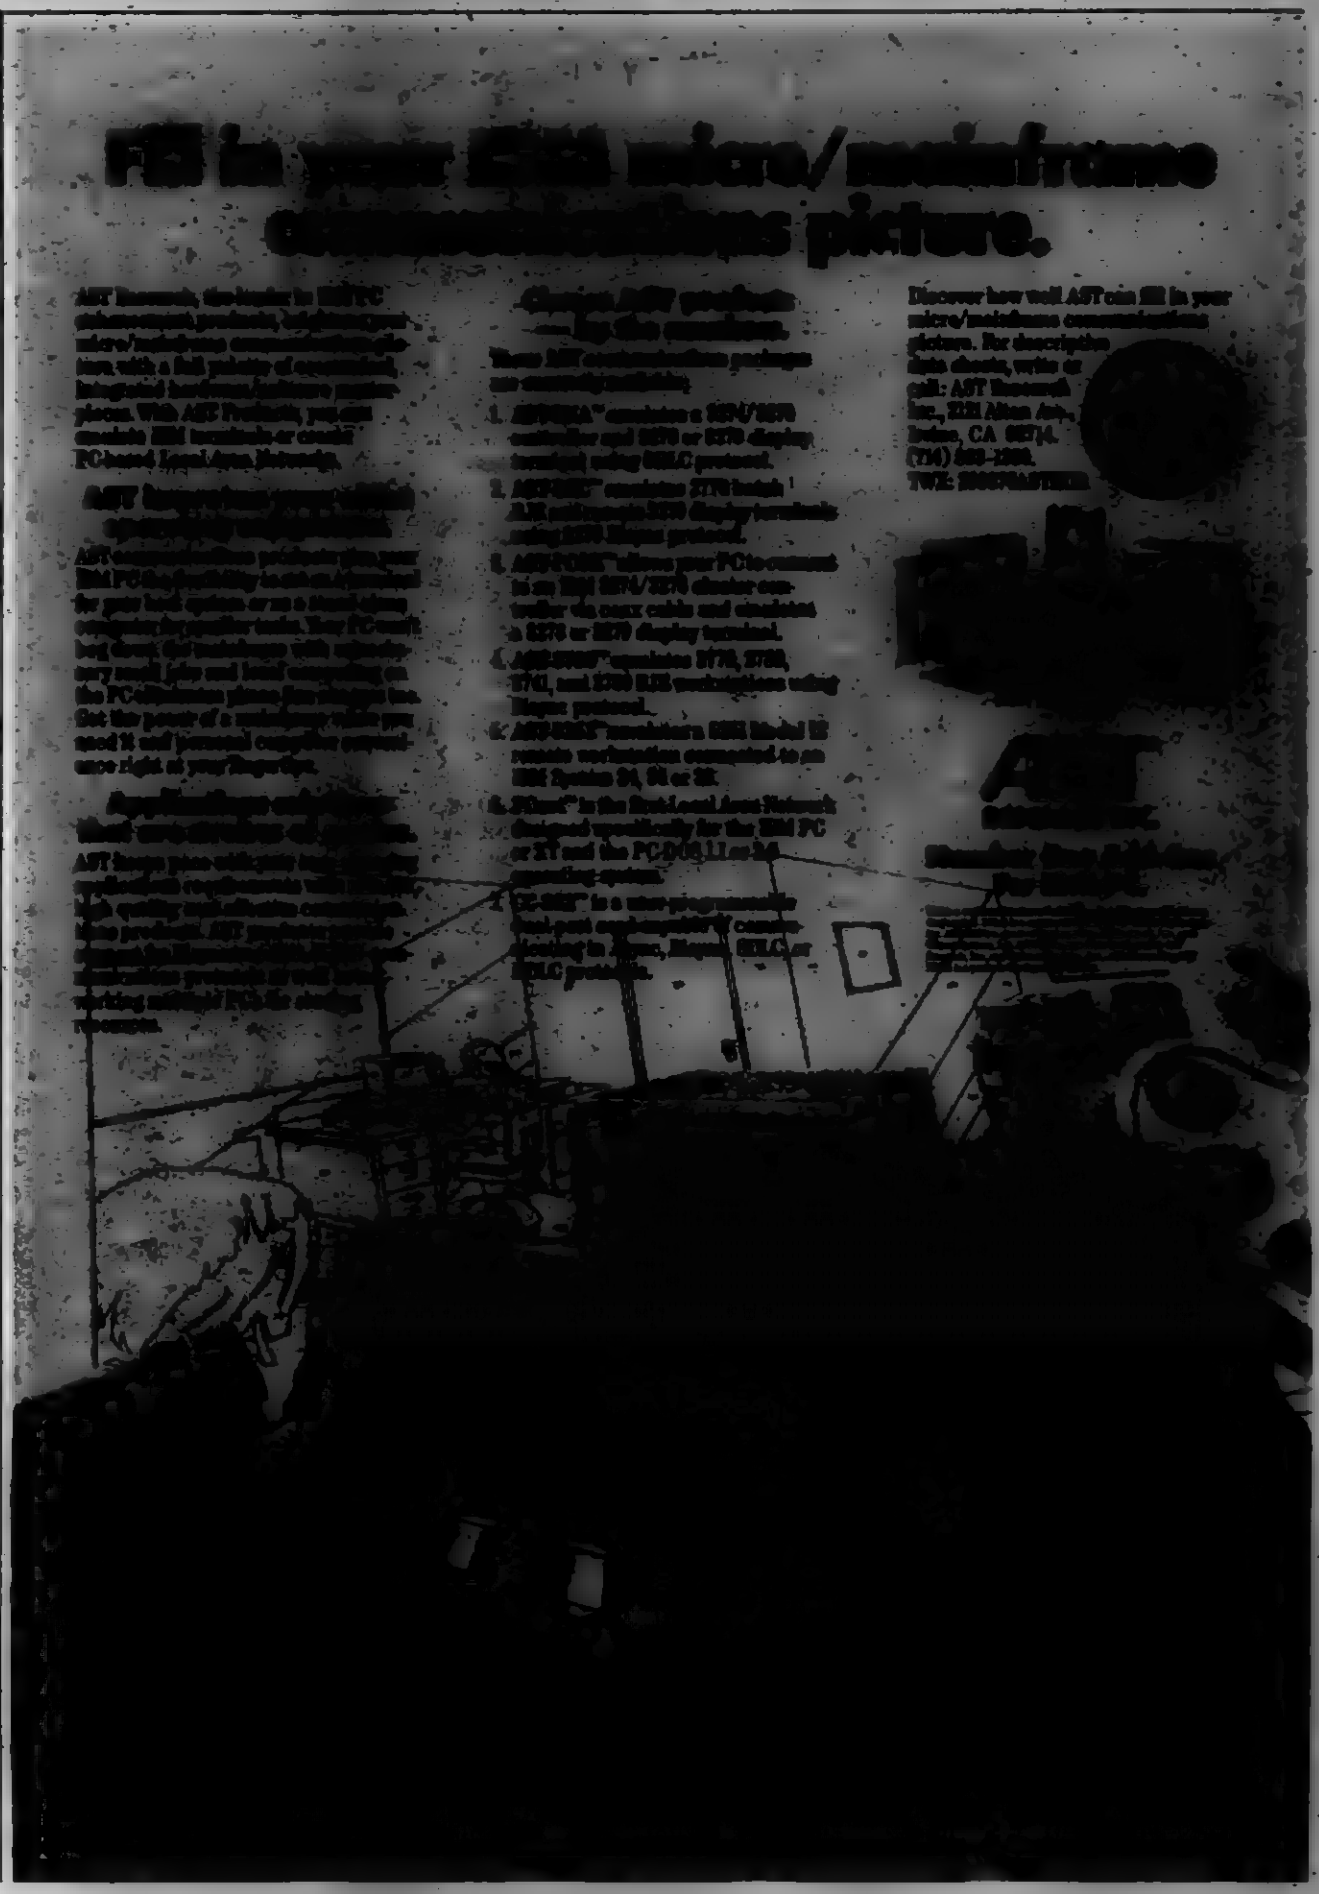
NEW ERA TECHNOLOGIES, INC.
Mist+

New Era Technologies, Inc. (NET) has announced Mist+, an integrated communications package for the IBM Personal Computer.

Designed to work with the Hayes Microcomputer Products, Inc. Smartmodem, Mist+ is also suitable for the IBM Personal Computer XT and compatible systems.

Mist+ includes communications links for most popular on-line services. The program can connect to one of these services on-line or in unattended mode, send and receive files, search on-line

Continued on page 126



MICROCOMPUTERS

Continued from page 122

data bases, disconnect or initiate another session with a different computer, the company explained.

Mist+ can also use interactive routines to gather additional information from the user, such as names of persons to whom the message is to be sent, what data base to search, what keywords to use and the name of the file in which the search results should be recorded. All telecommunications parameters are set, and all host commands are transmitted automatically by Mist+ routines, the company said.

The Mist+ system also allows a Personal Computer to be used as a remotely accessible host that permits the user of any dumb terminal, microcomputer or word processor to retrieve files, compose, send and store messages. A multilevel password system supports up to 900 users.

An optional text-oriented data base management system is also available.

Mist+ is priced at $295 or $495 with the data base option. Along with the release of Mist+, NET has reduced the price of its Digital Research, Inc. CP/M operating system version of Mist to $225 and $375 with the data base option.

NET, Suite 934, 2025 I St. N.W., Washington, D.C. 20006.

MANAGEMENT ANALYTIC SUPPORT, INC.
Cope

Management Analytic Support, Inc. has announced Cope, a system for solving linear and integer programming problems on a microcomputer.

According to the vendor, the Cope microcomputer package is based on the mainframe version previously available on Digital Equipment Corp.'s VAX-11 minicomputers, the DEC 20 and Hewlett-Packard Co.'s HP 3000 series systems.

Cope incorporates features such as optional narratives, prompts and a self-teaching tutor to walk the user through the system's procedures.

The initial implementation is available for the Sage Computer Technology Sage microcomputer, configured with Digital Research, Inc.'s CP/M 86 operating system.

Cope is configured for three ranges of applications: 40 constraints by 80 variables retails for $335; 80 by 200 is $465; and 150 by 300 is $685.

Management Analytic Support, 6836 Dean Drive, McLean, Va. 22101.

ON-LINE BUSINESS SYSTEMS, INC.
Wylbur/PC

On-Line Business Systems, Inc. has introduced Wylbur/PC, a program development package for the IBM Personal Computer.

Wylbur/PC features screen layout control for panel design and menu display, background and foreground color control and the capability to communicate with mainframe software products, the vendor said. The communications capability is programmable and can run automatically.

A full screen editor features four-way scrolling, global search and replace functions and 400 possible function-key definitions, according to the vendor.

Wylbur/PC requires 128K of random-access memory. There is a version that runs on mainframe computers.

A demonstration diskette costs $10, while the complete program sells for $550.

On-line Business Systems, 115 Sansome St., San Francisco, Calif. 94104.

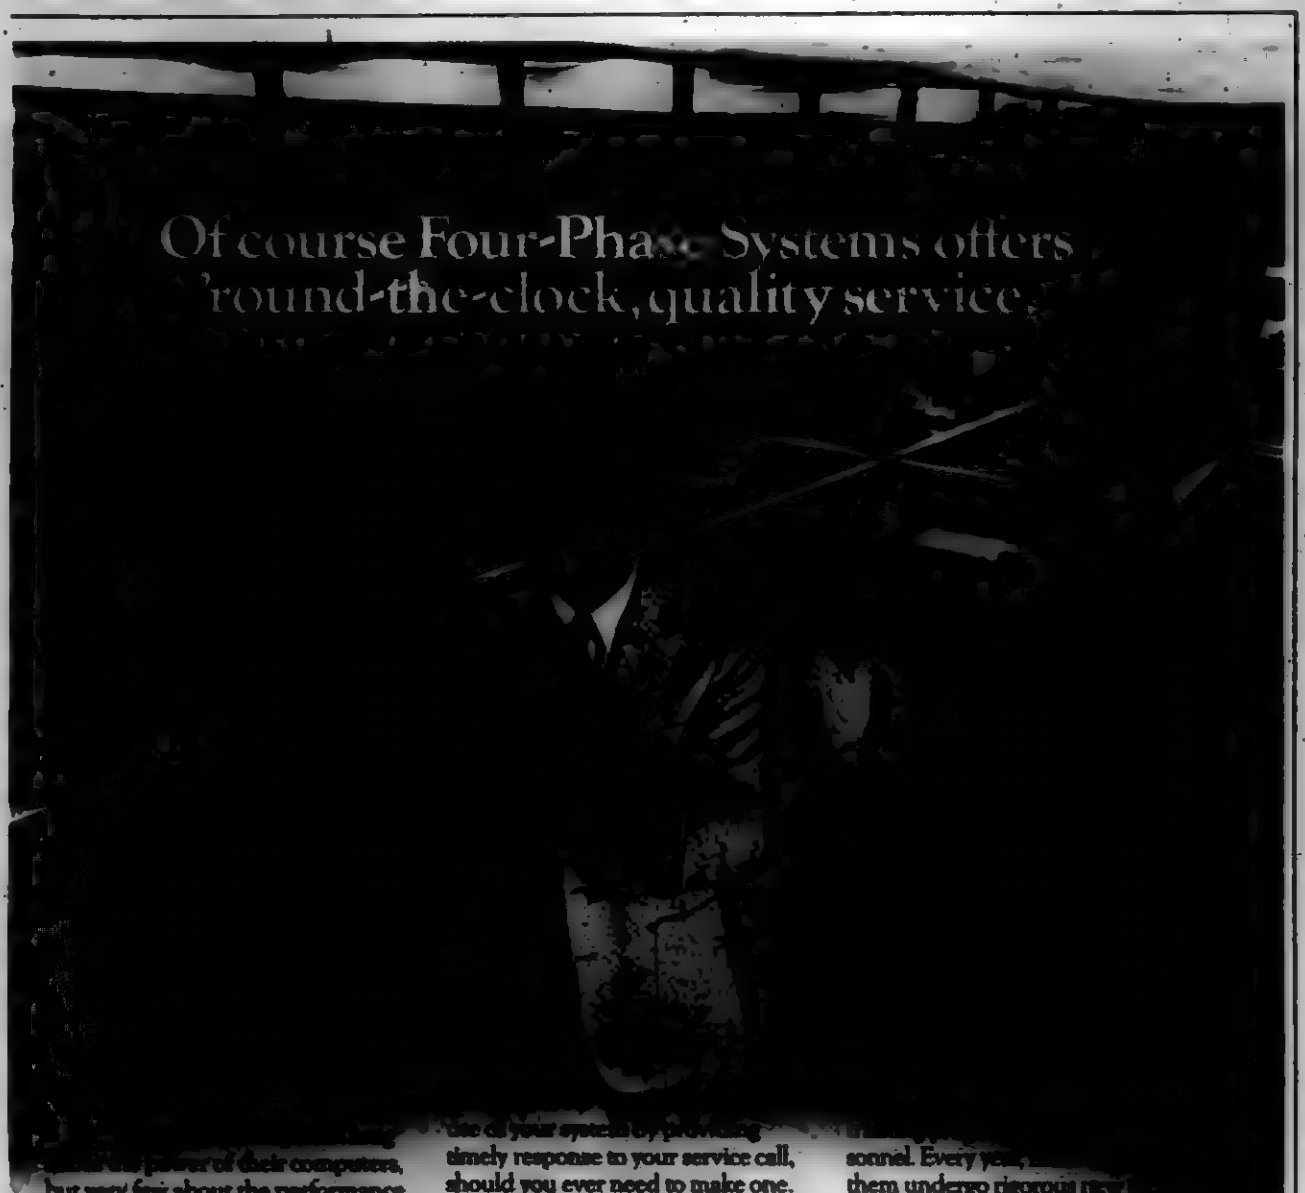
MICRO COURSEWARE CORP.
Computer Tutor 150

Micro Courseware Corp. (MCC) has announced a front-end tutorial package that is being bundled with the Hewlett-Packard Co. HP 150 personal computer.

Computer Tutor 150 reportedly uses interactive learning modules to introduce users to the HP 150 hardware, the system's touch feature and the applications manager that explains the operating system and application software.

The tutorial includes examples of software applications, a glossary of microcomputer buzzwords and educational games to reinforce comprehension, according to a spokesman for the company.

The package was customized by MCC for Hewlett-



...power of their computers, but very few about the performance of their service. They make a lot of noise about their hardware and software, but when it comes to service, they clam up, or promise what they can't deliver. Let's face it, very few companies have the resources to offer both a quality product and quality service.

Four-Phase Systems does.

We recognize and appreciate the trust you place in us when you purchase a Four-Phase computer system. And to preserve that trust we have invested millions of dollars in the development of our Field Engineering Operations Center. Its ...ize on your system by providing timely response to your service call, should you ever need to make one.
